SWMRE
Network Platform

SWMRE Configuration Guide

June 2019

Preface

This guide describes how to configure SWMRE.

Audience

This guide is intended for network administrators and other engineering professionals who configure SWMRE.

Conventions

Table P-1 shows the conventions used in this guide.

Table P-1: Conventions

Convention	Description
Italics	Emphasized terms; titles of books
Note:	Special instructions, suggestions, or warnings
`monospaced type`	Code elements such as commands, parameters, files, and directories

Chapter Organization

The chapters in command references are organized as described in Command Description Format.

The chapters in configuration guides are organized into these major sections:

- An overview that explains a configuration in words
- Topology with a diagram that shows the devices and connections used in the configuration
- Configuration steps in a table for each device where the left-hand side shows the commands you enter and the right-hand side explains the actions that the commands perform
- Validation which shows commands and their output that verify the configuration

Related Documentation

For information about installing of SWMRE, see the *Installation Guide* for your platform.

Command Line Interface

This chapter introduces the SWMRE Command Line Interface (CLI) and how to use its features.

Overview

You use the CLI to configure, monitor, and maintain SWMRE devices. The CLI is text-based and each command is usually associated with a specific task.

You can give the commands described in this manual locally from the console of a device running SWMRE or remotely from a terminal emulator such as `putty` or `xterm`. You can also use the commands in scripts to automate configuration tasks.

Command Line Interface Help

You access the CLI help by entering a full or partial command string and a question mark "?". The CLI displays the command keywords or parameters along with a short description. For example, at the CLI command prompt, type:

```
> show ?
```

The CLI displays this keyword list with short descriptions for each keyword: `show ?`

```
application-priority            Application    Priority
arp                             Internet Protocol (IP)
bfd                             Bidirectional Forwarding Detection (BFD)
bgp                             Border Gateway Protocol (BGP)
bi-lsp                          Bi-directional lsp status and configuration
bridge                          Bridge group commands
ce-vlan                         COS Preservation for Customer Edge VLAN
class-map                       Class map entry
cli                             Show CLI tree of current mode
clns                            Connectionless-Mode Network Service (CLNS)
control-adjacency               Control Adjacency status and configuration
control-channel                 Control Channel status and configuration
cspf                            CSPF Information
customer                        Display Customer spanning-tree
cvlan                           Display CVLAN information
debugging                       Debugging functions (see also 'undebug')
dot1x                           IEEE 802.1X Port-Based Access Control
etherchannel                    LACP etherchannel   ethernet
Layer-2 ...
```

If you type the ? in the middle of a keyword, the CLI displays help for that keyword only.

```
> show de? debugging Debugging functions (see
also 'undebug')
```

If you type the ? in the middle of a keyword, but the incomplete keyword matches several other keywords, SWMRE displays help for all matching keywords.

`> show i?` (CLI does not display the question mark).

```
interface  Interface status and configuration
ip         IP information isis       ISIS
information
```

Command Completion

The CLI can complete the spelling of a command or a parameter. Begin typing the command or parameter and then press the tab key. For example, at the CLI command prompt type `sh`:

```
> sh
```

Press the tab key. The CLI displays:

```
> show
```

If the spelling of a command or parameter is ambiguous, the CLI displays the choices that match the abbreviation. Type `show i` and press the tab key. The CLI displays:

```
> show i
  interface  ip          ipv6       isis
> show i
```

The CLI displays the `interface` and `ip` keywords. Type `n` to select `interface` and press the tab key. The CLI displays:

```
> show in
> show interface
```

Type ? and the CLI displays the list of parameters for the `show interface` command.

```
> show interface
  IFNAME  Interface name
  |       Output modifiers
  >       Output redirection
  <cr>
```

The CLI displays the only parameter associated with this command, the `IFNAME` parameter.

Command Abbreviations

The CLI accepts abbreviations that uniquely identify a keyword in commands. For example:

`> sh in xe0` is

an abbreviation for:

```
> show interface xe0
```

Command Line Errors

Any unknown spelling causes the CLI to display the error `Unrecognized command` in response to the ?. The CLI displays the command again as last entered.

```
> show dd?
% Unrecognized
command > show dd
```

When you press the Enter key after typing an invalid command, the CLI displays:

```
(config)#router ospf here
```

```
                                ^
% Invalid input detected at '^' marker.
```

where the ^ points to the first character in error in the command. If a command is incomplete, the CLI displays the following message:

```
> show
% Incomplete command.
```

Some commands are too long for the display line and can wrap mid-parameter or mid-keyword, as shown below. This does *not* cause an error and the command performs as expected:

```
area 10.10.0.18 virtual-link 10.10.0.19 authent ication-
key 57393
```

Command Negation

Many commands have a `no` form that resets a feature to its default value or disables the feature. For example:

- The `ip address` command assigns an IPv4 address to an interface
- The `no ip address` command removes an IPv4 address from an interface

Syntax Conventions

Table P-2 describes the conventions used to represent command syntax in this reference.

Table P-2: Syntax conventions

Convention	Description	Example
`monospaced font`	Command strings entered on a command line	`show ip ospf`
`lowercase`	Keywords that you enter exactly as shown in the command syntax.	`show ip ospf`
`UPPERCASE`	See Variable Placeholders	`IFNAME`
`()`	Optional parameters, from which you must select one. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.	`(A.B.C.D|<0-4294967295>)`
`()`	Optional parameters, from which you select one or none. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.	`(A.B.C.D|<0-4294967295>|)`

`()`	Optional parameter which you can specify or omit. Do not enter the parentheses or vertical bar as part of the command.	`(IFNAME|)`

Table P-2: Syntax conventions (Continued)

Convention	Description	Example
`{}`	Optional parameters, from which you must select one or more. Vertical bars delimit the selections. Do not enter the braces or vertical bars as part of the command.	`{intra-area <1-255>|inter-area <1-255>|external <1-255>}`
`[]`	Optional parameters, from which you select zero or more. Vertical bars delimit the selections. Do not enter the brackets or vertical bars as part of the command.	`[<1-65535>|AA:NN|internet|local-AS| no-advertise|no-export]`
`?`	Nonrepeatable parameter. The parameter that follows a question mark can only appear once in a command string. Do not enter the question mark as part of the command.	`?route-map WORD`
`.`	Repeatable parameter. The parameter that follows a period can be repeated more than once. Do not enter the period as part of the command.	`set as-path prepend .<1-65535>`

Variable Placeholders

Table P-3 shows the tokens used in command syntax use to represent variables for which you supply a value.

Table P-3: Variable placeholders

Token	Description
`WORD`	A contiguous text string (excluding spaces)
`LINE`	A text string, including spaces; no other parameters can follow this parameter
`IFNAME`	Interface name whose format varies depending on the platform; examples are: `eth0`, `Ethernet0`, `ethernet0`, `xe0`
`A.B.C.D`	IPv4 address
`A.B.C.D/M`	IPv4 address and mask/prefix
`X:X::X:X`	IPv6 address

`X:X::X:X/M`	IPv6 address and mask/prefix
`HH:MM:SS`	Time format
`AA:NN`	BGP community value

Table P-3: Variable placeholders

Token	Description
`XX:XX:XX:XX:XX:XX`	MAC address

`<1-5>`
`<1-65535>`
`<0-2147483647> <0-4294967295>`
	Numeric range

Command Description Format

Table P-4 explains the sections used to describe each command in this reference.

Table P-4: Command descriptions

Section	Description
Command Name	The name of the command, followed by what the command does and when should it be used
Command Syntax	The syntax of the command
Parameters	Parameters and options for the command
Default	The state before the command is executed
Command Mode	The mode in which the command runs; see Command Modes
Example	An example of the command being executed

Keyboard Operations

Table P-5 lists the operations you can perform from the keyboard.

Table P-5: Keyboard operations

Key combination	Operation
Left arrow or Ctrl+b	Moves one character to the left. When a command extends beyond a single line, you can press left arrow or Ctrl+b repeatedly to scroll toward the beginning of the line, or you can press Ctrl+a to go directly to the beginning of the line.
Right arrow or Ctrl-f	Moves one character to the right. When a command extends beyond a single line, you can press right arrow or Ctrl+f repeatedly to scroll toward the end of the line, or you can press Ctrl+e to go directly to the end of the line.
Esc, b	Moves back one word
Esc, f	Moves forward one word

Table P-5: Keyboard operations (Continued)

Key combination	Operation
Ctrl+e	Moves to end of the line
Ctrl+a	Moves to the beginning of the line
Ctrl+u	Deletes the line
Ctrl+w	Deletes from the cursor to the previous whitespace
Alt+d	Deletes the current word
Ctrl+k	Deletes from the cursor to the end of line
Ctrl+y	Pastes text previously deleted with Ctrl+k, Alt+d, Ctrl+w, or Ctrl+u at the cursor
Ctrl+t	Transposes the current character with the previous character
Ctrl+c	Ignores the current line and redisplays the command prompt
Ctrl+z	Ends configuration mode and returns to exec mode
Ctrl+l	Clears the screen
Up Arrow or Ctrl+p	Scroll backward through command history
Down Arrow or Ctrl+n	Scroll forward through command history

Show Command Modifiers

You can use two tokens to modify the output of a `show` command. Enter a question mark to display these tokens:

```
# show users ?
  | Output modifiers
  > Output redirection
```

You can type the | (vertical bar character) to use output modifiers. For example:

```
> show rsvp | ?
  begin       Begin with the line that matches
exclude    Exclude lines that match   include
Include lines that match    redirect   Redirect
output
```

Begin Modifier

The `begin` modifier displays the output beginning with the first line that contains the input string (everything typed after the `begin` keyword). For example:

```
# show running-config | begin xe1
...skipping interface
xe1
 ipv6 address fe80::204:75ff:fee6:5393/64
! interface xe2
ipv6 address
fe80::20d:56ff:
fe96:725a/64
! line con
0 login
! end
```

You can specify a regular expression after the `begin` keyword, This example begins the output at a line with either "xe2" or "xe4":

```
# show running-config | begin xe[3-4]

...skipping interface
xe3  shutdown
! interface
xe4 shutdown
!
interface svlan0.1 no
shutdown
!
route-map myroute permit 3
!
route-map mymap1 permit 10
!
route-map rmap1 permit 3
! line con 0
login line vty
0 4  login
! end
```

Include Modifier

The `include` modifier includes only those lines of output that contain the input string. In the output below, all lines containing the word “input” are included:

```
# show interface xe1 | include input
    input packets 80434552, bytes 2147483647, dropped 0, multicast packets 0
input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 1, missed 0
```

You can specify a regular expression after the `include` keyword. This examples includes all lines with “input” or “output”:

```
#show interface xe0 | include (in|out)put
    input packets 597058, bytes 338081476, dropped 0, multicast packets 0
input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
output packets 613147, bytes 126055987, dropped 0 output errors 0,
aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
```

Exclude Modifier

The `exclude` modifier excludes all lines of output that contain the input string. In the following output example, all lines containing the word “input” are excluded:

```
# show interface xe1 | exclude input
Interface xe1
  Scope: both
  Hardware is Ethernet, address is 0004.75e6.5393
  index 3 metric 1 mtu 1500 <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Administrative Group(s): None   DSTE
Bandwidth Constraint Mode is MAM   inet6
fe80::204:75ff:fee6:5393/64
    output packets 4438, bytes 394940, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window
0 collisions 0
```

You can specify a regular expression after the `exclude` keyword. This example excludes lines with “output” or “input”:

```
# show interface xe0 | exclude
(in|out)put Interface xe0
  Scope: both
  Hardware is Ethernet Current HW addr: 001b.2139.6c4a
Physical:001b.2139.6c4a Logical:(not set)
  index 2 metric 1 mtu 1500 duplex-full arp ageing timeout 3000
  <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound Bandwidth
  100m
  DHCP client is disabled. inet
10.1.2.173/24 broadcast 10.1.2.255
  VRRP Master of :  VRRP is not configured on this interface.
inet6 fe80::21b:21ff:fe39:6c4a/64     collisions 0
```

Redirect Modifier

The `redirect` modifier writes the output into a file. The output is not displayed.

```
# show cli history | redirect /var/frame.txt
```

The output redirection token (>) does the same thing:

```
# show cli history >/var/frame.txt
```

Command Modes

Commands are grouped into modes arranged in a hierarchy. Each mode has its own set of commands. Table P-6 lists the command modes common to all protocols.

Table P-6: Common command modes

Name	Description
Executive mode	Also called *view* mode, this is the first mode to appear after you start the CLI. It is a base mode from where you can perform basic commands such as `show`, `exit`, `quit`, `help`, `list`, and `enable`.
Privileged executive mode	Also called *enable* mode, in this mode you can run additional basic commands such as `debug`, `write`, and `show`.

Table P-6: Common command modes (Continued)

Name	Description
Configure mode	Also called *configure terminal* mode, in this mode you can run configuration commands and go into other modes such as interface, router, route map, key chain, and address family.
Interface mode	In this mode you can configure protocol-specific settings for a particular interface. Any setting you configure in this mode overrides a setting configured in router mode.
Router mode	This mode is used to configure router-specific settings for a protocol such as RIP or OSPF.

Command Mode Tree

The diagram below shows the common command mode hierarchy.

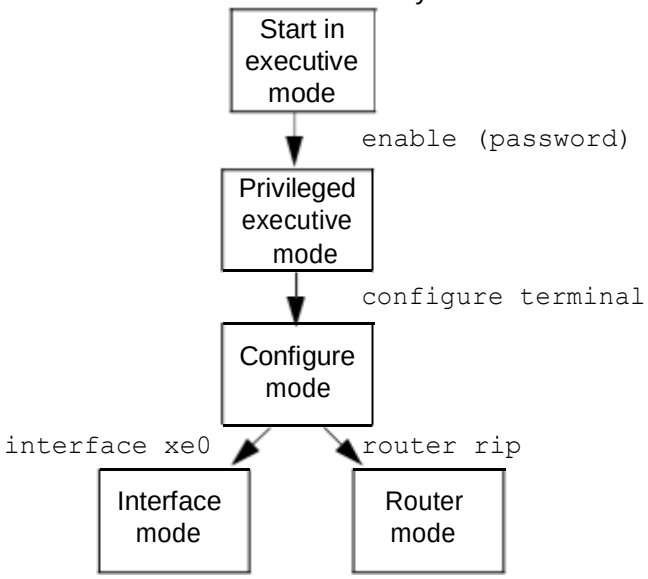

Figure P-1: Common command modes

To change modes:

1. Enter privileged executive mode by entering `enable` in Executive mode.
2. Enter configure mode by entering `configure terminal` in Privileged Executive mode.

The example below shows starting `imish` and then moving from executive mode to privileged executive mode to configure mode and finally to router mode:

```
# ./imish
> enable mypassword
# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
(config)# router rip
(config-router)#
```

Note: Each protocol can have modes in addition to the common command modes. See the command reference for the respective protocol for details.

SECTION 1 Architecture

Architecture Guide

Contents

This document contains this chapter:

- Chapter 1, *SWMRE Architecture*
- Chapter 2, *SWMRE Key Features*
- Chapter 3, *SWMRE Abstraction Layers*

CHAPTER 1 SWMRE Architecture

This chapter introduces SWMRE and describes its high-level architecture.

SWMRE Network Platform Overview

The SWMRE network platform is Layer 2 (data link) and Layer 3 (network layer) control plane software that allows network equipment manufacturers to rapidly add networking capabilities to communications products. SWMRE takes advantage of separate data plane processors (network processing units and switch ASICs). SWMRE is targeted at Tier 1 and Tier 2 network equipment manufacturers who provide solutions in:

- Carrier transport, access, and Carrier Ethernet
- Mobile backhaul and access
- Data center and cloud networking, including solutions for enterprise private clouds, hybrid clouds, and public clouds

The SWMRE networking protocol modules conform to leading IEEE, IETF, MEF, and industry-specific standards. SWMRE supports more than 200 protocols for:

- Layer 2 switching: Virtual Local Area Networks (VLANs), Spanning Tree, Data Center Bridging, TRILL, PTP
- Layer 3 routing: OSPFv2/v3, RIP/RIPng, BGP4+, ISIS
- Multi-Protocol Label Switching (MPLS) which operates at a layer between traditional definitions of Layer 2 and Layer 3
- Carrier Ethernet
- Data Center Ethernet

SWMRE is built on an SDN architecture that features:

- High degree of scalability
- Modularity and programmability
- Embedded abstraction layer to communicate with the underlying operating system
- Hardware abstraction layer to run on a variety of silicon switching chipsets for forwarding table updates

The modular architecture of SWMRE lets you select and integrate only the protocols you need. Each protocol module runs as a separate daemon with its own address space and stack. This isolates issues with one protocol module from all others. You can readily add a customized protocol module to address specific needs.

Note: For a list of all daemon file names, see the *SWMRE Installation Guide*.

SWMRE provides configuration management at multiple layers:

- Command line interface
- SNMP
- External simple management interface C API

Internal C API
SWMRE Architecture

High-Level Architecture

Figure 1-1 shows the high-level architecture of SWMRE.

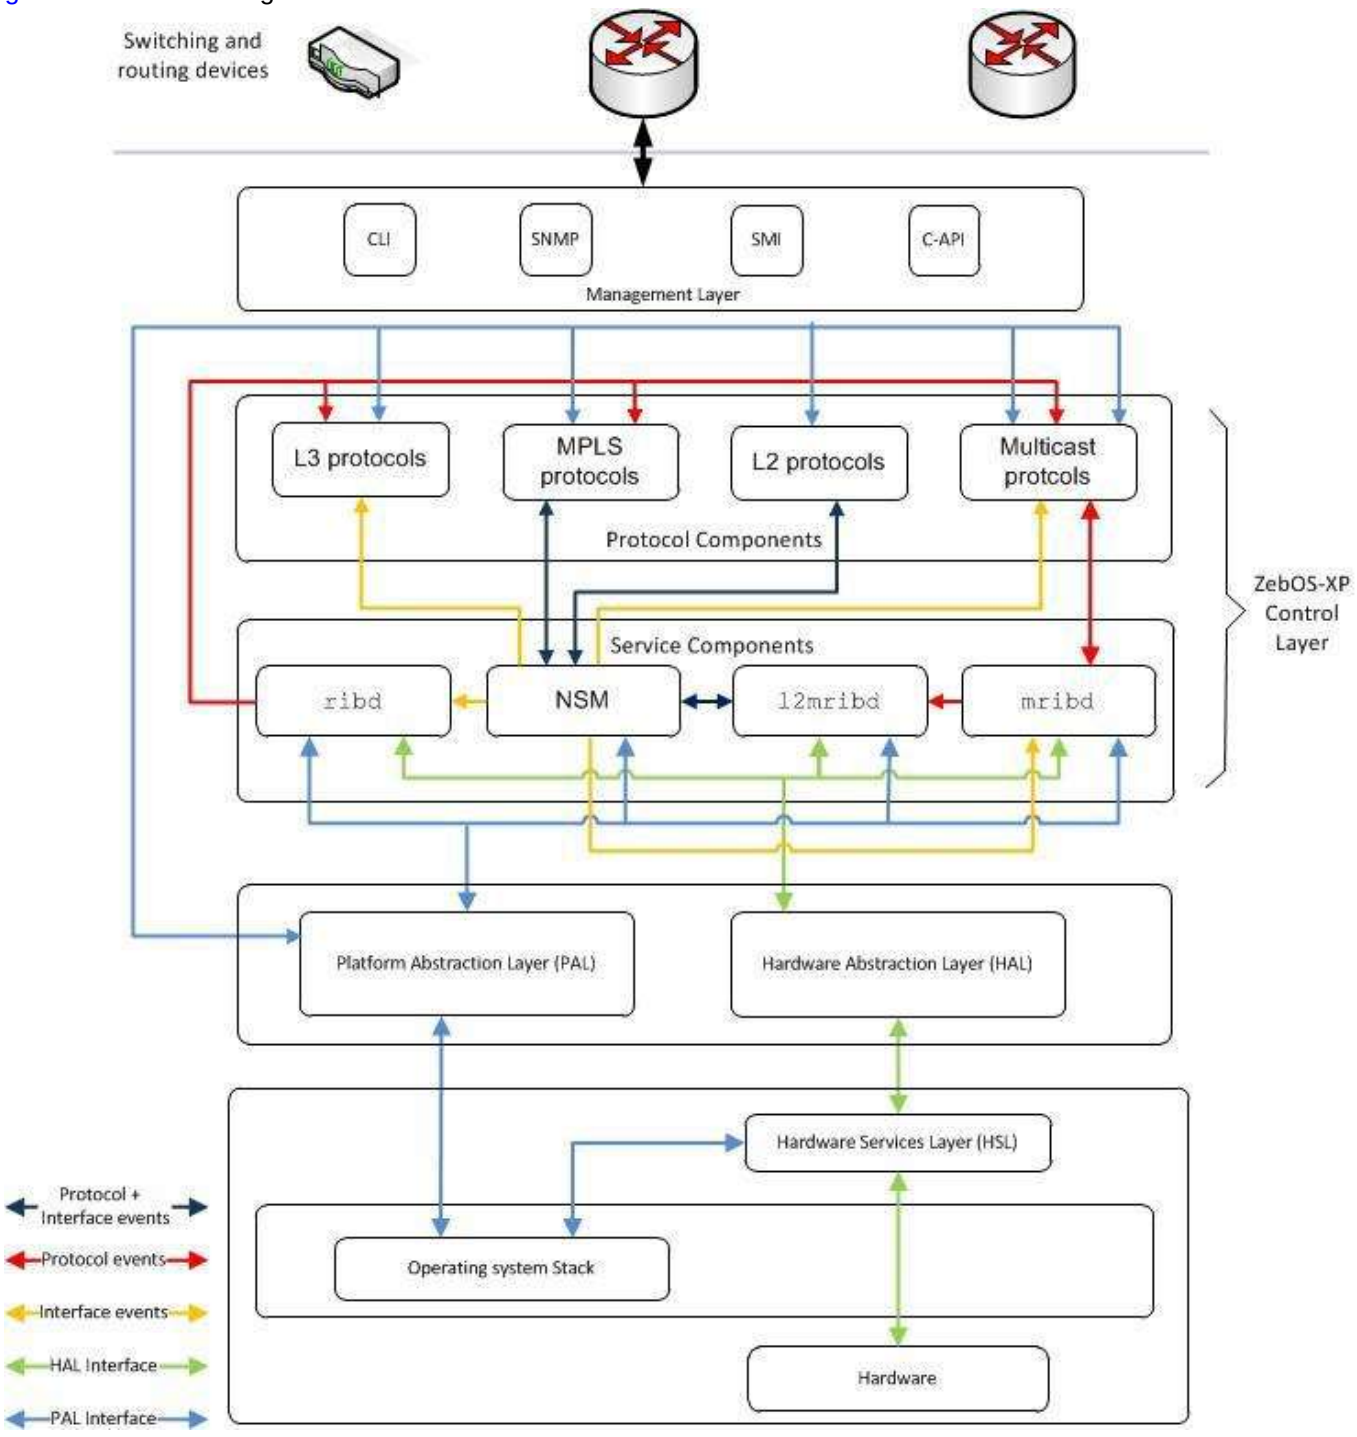

Figure 1-1: High-level architecture

SWMRE Architecture

At the top of Figure 1-1 is the Management Interface used to manage, configure, and operate the SWMRE routing and switching protocols.

The major components in the control layer of SWMRE are grouped into these categories:

- Protocol components, which include:

- Layer 3 Protocols
- Multi Protocol Label Switching Protocols
- Layer 2 Protocols
- Multicast Protocols
- Service components, which include:
- Network Services Module (NSM)
- Unicast Routing Information Base Daemon (ribd)
- Layer 2 Multicast Routing Information Base Daemon (l2mribd)
- Layer 3 Multicast Routing Information Base Daemon (mribd) The bottom of Figure 1-1 shows the abstraction layers of SWMRE:
- Platform Abstraction Layer
- Hardware Abstraction Layer

CHAPTER 2 SWMRE Key Features

This chapter describes the key features of SWMRE.

Management Interface

SWMRE provides a comprehensive set of tools to manage, configure, and operate the routing and switching protocols.

The management interface includes:

- Command Line Interface
- Simple Network Management Protocol
- Simple Management Interface
- C Language Application Programming Interface

Command Line Interface

The command line interface (CLI) offers complete, unified management of SWMRE. Each command is usually associated with a specific task. The CLI has two major components:

- The Integrated Management Interface process (`imi`) is a centralized, persistent daemon for managing the SWMREXP configuration that runs as a server of NSM and the protocols. The `imi` daemon connects to protocol daemons through inter-process communications.
- IMI shell (`imish`) is a interactive daemon program for the `imi` daemon that enables connection locally from the console of a device running SWMRE or remotely from terminal emulator programs such as `ssh` or `telnet`.

Through `imish`, a system administrator can configure and monitor all of the SWMRE daemons through one centralized connection. The `imish` daemon maintains a persistent connection to all protocol daemons, stores configuration data, and offers extensive monitoring and logging capabilities.

The CLI can use the secure authentication methods of the operating system to manage and validate user names and passwords.

Simple Network Management Protocol

The Simple Network Management Protocol (SNMP) provides a standardized framework and a common language for monitoring and managing devices in a network. The SNMP framework has three parts:

- SNMP manager: A system used to control and monitor the activities of network devices. This is sometimes called a Network Management System (NMS).
- SNMP agent: The component within a managed device that maintains the data for the device and reports data to SNMP managers.
- Management Information Base (MIB): SNMP exposes management data in the form of variables on the managed device which network management agents can extract from the SWMRE protocols for all standard defined MIBs.

As shown in Figure 2-2, an SNMP manager on the network sends query packets to gather status data. Each protocol daemon responds to these queries as defined by the corresponding MIB for the protocol.

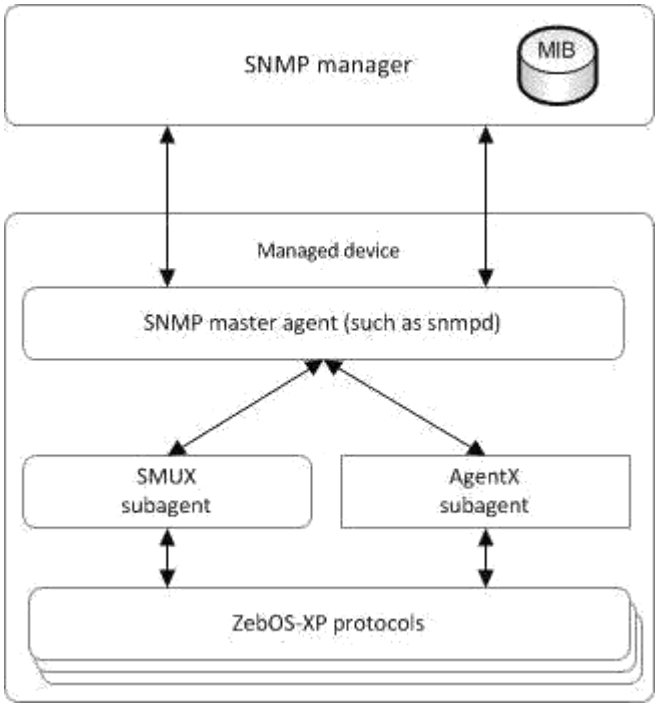

Figure 2-2: SNMP subagents SWMRE

supports these subagents:

- The SMUX (SNMP Multiplexing) protocol defined by RFC 1227 is enabled by default. The SMUX agent responds to UDP-161 packets, and transmits them to SWMRE over TELNET connections using port 199.
- The AgentX (Agent Extensibility) protocol defined by RFC 2741 uses TCP-705 for communication between the subagent and the master agent.

Note: You cannot configure SNMP with both SMUX and AgentX. One or the other must be used.

Each protocol daemon in SWMRE has an SNMP API that give developers the flexibility to integrate with any management plane. In addition, SWMRE can log both the systems' events and errors.

For more about installing and configuring SNMP agents and subagents, see the *Installation Guide*. For more about the MIBs a SWMRE protocol daemon supports, see the developer guide for the protocol.

Simple Management Interface

The Simple Management Interface (SMI) is a C language API that you use to write applications that configure and manage the SWMRE routing and switching protocols. For more see Chapter 6, *Management Modules*.

C Language Application Programming Interface

Every SWMRE protocol module provides a C language Application Programming Interface (API) for configuring properties of the protocol. For example, the `ospf_api.h` include file defines an API for configuring the OSPF protocol. Use these APIs to integrate with any management plane to control the SWMRE software.

Note: You must call the functions in a SWMRE C language API in the same process space as SWMRE (that is, from a SWMRE daemon).

Network Services Module

Network Services Module (NSM) is the core of the SWMRE architecture. NSM is the base module that simultaneously and independently communicates with every SWMRE routing and switching process. The protocol components use APIs exposed by the NSM client, which act as conduits to transfer data between the protocol modules and NSM.

NSM also interacts with the Platform Abstraction Layer (PAL) to communicate with the underlying operating system. Figure 2-3 shows NSM interacting with PAL and the protocols.

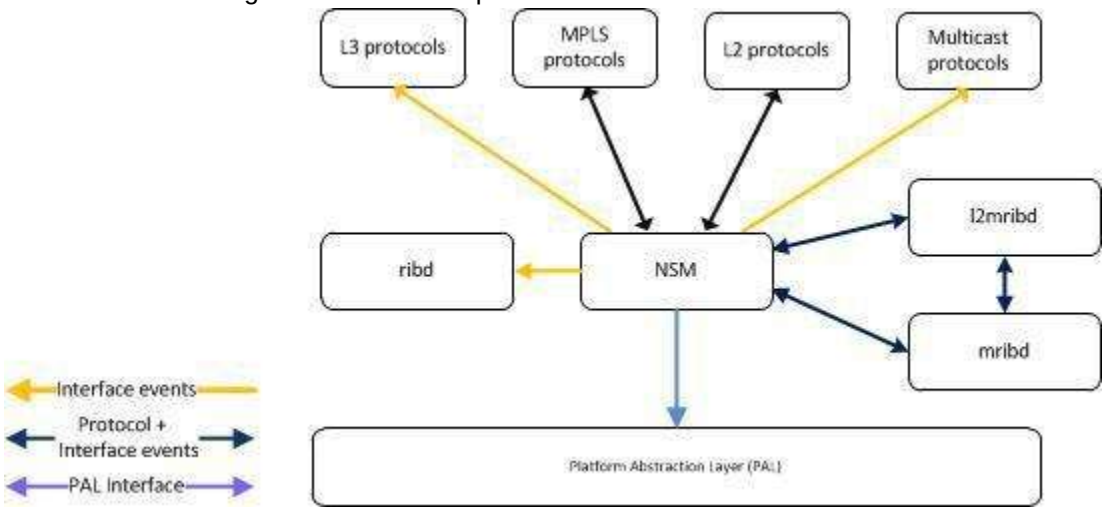

Figure 2-3: NSM

NSM provides the following services to the protocol components:

- Interface management
- Layer 2
- VLAN management for Layer 2 switching
- MPLS label management
- Traffic engineering
- QoS management
- Virtual Routing/Virtual Route Forwarding (VR/VRF) Management
- Virtual Private LAN Service (VPLS) and Virtual Private Wire Service (VPWS)

The protocol modules use the NSM client module to register for relevant services they want from NSM. The NSM server module manages the list of connected NSM clients and publishes information to them.

For more information about NSM, see the *Network Services Module Developer Guide.*

Interface Manager

The NSM Interface Manager provides a logical view of the interfaces in the system to the control plane. The Interface Manager configures and manages the physical and logical interface and provides the following functions:

- Manages and configures interfaces that are not managed by the network processor or ASIC
- Manages the learning, configuration, and management of the hardware interfaces present on the network processor or ASIC
  Provides an abstracted TCP/IP interface that can be populated by different TCP/IP stacks with the same operating system
- For Layer 3 interfaces, populates the interface in the TCP/IP stack for slow path and exception packet handling

- Maintains the database and hierarchies for all interface types and their relationships to each other and functions to maintain and change these hierarchies from the control plane
- Provides interfaces to link scanning tasks for interface up/down asynchronous events

Layer 2 Protocols

SWMRE includes these Layer 2 features:

- Virtual Local Area Networks
- Link Aggregation
- Multi-Chassis Link Aggregation
- Spanning Tree
- Data Center Bridging
- Port Authentication (authd)
- Precision Time Protocol
- Synchronous Ethernet
- Shortest Path Bridging (IEEE 802.1aq)
- Edge Virtual Bridging
- Ethernet Automatic Protection Switching
- Ethernet Local Management Interface
- Remote Monitoring

Figure 2-4 shows the SWMRE Layer 2 high-level architecture.

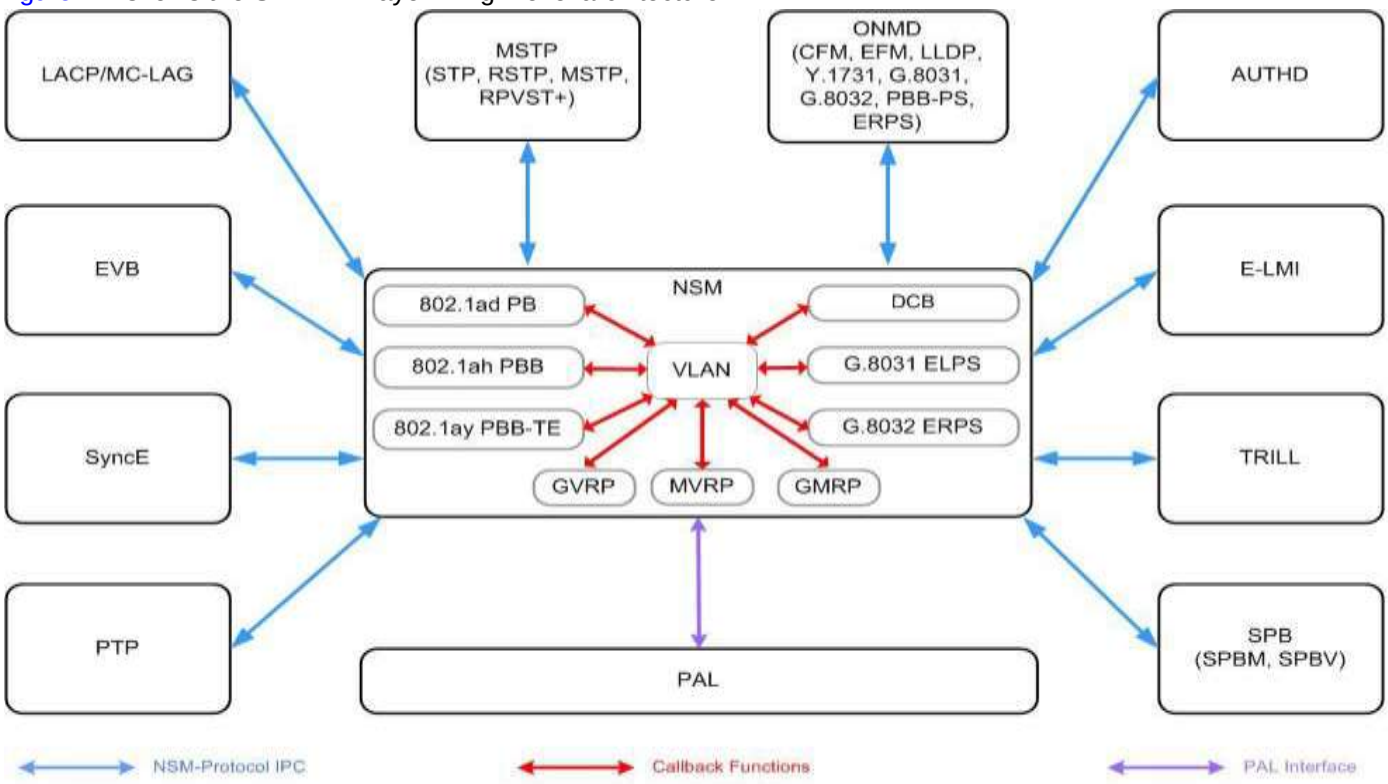

Figure 2-4: Layer 2 architecture

Virtual Local Area Networks

The VLAN modules offer a consistent network-wide management tools to manage virtual LANs (Local Area Networks) and bridged VLANs:

- VLAN bridging allows network devices to segment into VLANs, regardless of their physical location.
- VLANs, in accordance with IEEE 802.1Q, enable multiple bridged LANs to transparently share the same physical network link without leaking information between LANs. Traffic between VLANs is restricted to bridges that forward unicast, multicast, or broadcast traffic only on the LAN segments that serve the VLAN to which the traffic belongs.

SWMRE VLAN modules make it easy to administer logical groups of stations that can communicate as if they were on the same LAN. They make it easier to manage a move, add, delete, or other updates to members of these groups.

The following highlights the features of the VLAN modules.

MAC Bridging (802.1d)

The SWMRE VLAN modules support all IEEE 802.1D LAN MAC (Media Access Control) protocols, shared media, and point-to-point LANs. MAC bridging allows multiple LANs to be connected together. MAC bridging filters data sent between LAN segments, reduces network congestion, and allows networks to be partitioned for administrative purposes.

Identifying VLANS

VLAN identifiers (VIDs):

- Offer convenient, consistent, and network-wide methods for bridges to identify rules to classify user data for VLANs
- Extend source and destination MAC addresses by treating addressing for different VLANs independently

  Identify and select from multiple active topologies; and identify parameters that restrict access from one part of a network to another

Provider Bridging (802.1ad)

Provider Bridging (PB) enables a service provider to use the architecture and protocols of 802.Q to offer the equivalent of separate Local Area Networks (LANs), bridged LANs, or virtual bridged LANs to multiple customers. Provider bridging requires no active cooperation between customers and requires minimal cooperation between an individual customer and the service provider.

When VLANs were originally defined in the 802.1Q, the number of unique VLAN identifiers was limited to 4096. In large provider networks, each subscriber needs a separate address, thus this limit could prevent a provider from having more than 4096 subscribers.

To overcome the 4096 VLAN identifier limit, the frame format for 802.1ad inserts an additional VLAN header into a single 802.1Q Ethernet frame. There are two types of VLAN headers:

- The C-VLAN or inner header which is closest to the payload portion of the frame identifies the customer VLAN
- The S-VLAN or outer header which is closest to the Ethernet header identifier the provider VLAN The frame

  format for 802.1ad is also called “Q-in-Q” or “double tagged”.

With the two VLAN identifiers in combination for each provider-customer pair, it is possible to define up to 16,777,216 labels.

Provider Backbone Bridging (802.1ah)

Provider Backbone Bridging (PBB) adds the capability to create Ethernet backbones for service access networks. PBB extends 802.1ad Provider Bridging in these ways:

- The 802.1ah header adds a service instance identifier (I-SID) which is a label that maps to a customer VLAN identifier. An I-SID virtualizes VLANs across a network. VLANs are mapped into I-SIDs by configuring only the edge of the network at the Backbone Edge Bridges (BEBs). This makes the maximum number of service instances 16 million.
- The 802.1ah header encapsulates backbone source and destination MAC addresses (termed B-SA and B-DA) along with the customer source and destination MAC addresses (C-SA and C-DA). The 802.1ah format is sometimes called “MAC-in-MAC” because of this. The encapsulation of customer MAC addresses in backbone MAC addresses means that the backbone does not need to learn customer MAC addresses. Customer MAC addresses are learned at BEB ports only.

Provider Backbone Bridge-Traffic Engineering (802.1Qay)

The Provider Backbone Bridging-Traffic Engineering (PBB-TE) standard supports the construction of “traffic engineered” backbone topologies, load balancing, protection switching, bandwidth management, and so on to serve the needs of large service providers. Provider networks rely on direct control of path routing so that traffic engineering can be used to allocate bandwidth, ensure diverse backup path routing, and select path performance as required by service level agreements. The architecture of bridges and their associated protocols as specified by 802.1ah allows the further specification of interoperable bridge capabilities that support traffic engineering at the required scale.

Registration Frameworks

The Layer 2 support in SWMRE includes these registration frameworks:

- Generic Attribute Registration Protocol: GARP is a generic framework for bridges to register and de-register attributes, such as VLAN identifiers and multicast group membership.
- GARP VLAN Registration Protocol (802.1Q): GVRP is a GARP application that provides VLAN registration service.

  GVRP uses GARP Information Declaration (GID) and GARP Information Propagation (GIP), which provide the common state machine descriptions and the common information propagation mechanisms defined for GARPbased applications.

  GVRP provides support for VLAN pruning and dynamic VLAN creation. A switch can exchange VLAN configuration information with other GVRP switches, prune unnecessary broadcast and unknown unicast traffic, and dynamically create and manage VLANs.
- GARP Multicast Registration Protocol: GMRP allows participants to dynamically register and de-register information with the Media Access Control (MAC) bridges attached to the same LAN segment. A switch can exchange multicast group information with other GMRP switches, prune unnecessary broadcast traffic, and dynamically create and manage multicast groups.
- Multicast Registration Protocol (802.1ak): MRP has protocols, procedures, and managed objects to support multiple registrations, and allow the participants in an MRP application to register attributes with other participants in a bridged LAN.
- Multiple VLAN Registration Protocol (802.1ak): MVRP registers multiple VLANs and provides for the rapid healing of network failures without interrupting services to unaffected VLANs. In addition, MVRP improves the convergence time of the GVRP module.
- Multiple Multicast Registration Protocol (802.1ak) MMRP manages group Media Access Control (MAC) addresses. In addition, MMRP improves the convergence time of GMRP.

VLAN Prioritization (802.1p/Q)

SWMRE includes priority signaling for traffic at the data-link layer. IEEE 802.1Q specifies a priority value of between 0 and 7 inclusive that can be used by QoS (Quality of Service) disciplines to differentiate traffic. Although this technique is often called “802.1p”, there is no standard by that name published by the IEEE. Instead, the technique is incorporated into 802.1Q standard which specifies the tag inserted into an Ethernet frame.

Port and Protocol Classification (802.1v)

Port and Protocol Classification is an amendment to 802.1Q to classify incoming packets by methods other than source port information, specifically, classification based on data-link-layer protocol identification.

Link Aggregation

The Link Aggregation module allows one or more links to be aggregated together to form a Link Aggregation Group (LAG), such that a MAC client can treat the Link Aggregation Group as if it were a single link. The Link Aggregation Control Protocol (LACP) allows bundling of several physical interfaces to form a single logical channel providing enhanced performance and redundancy. The aggregated interface is viewed as a single link to each switch. The spanning tree also views it as one interface. When there is a failure in one physical interface, the remaining interfaces stay up, so there is no disruption.

Multi-Chassis Link Aggregation

Multi-Chassis Link Aggregation (also called MC-LAG, MLAG, or Distributed Resilient Network Interconnect [DRNI]) extends the link aggregation concept to ensure that connectivity between two networks can be maintained despite the failure of a node. With MC-LAG, at either one or both ends of a link aggregation group, a single aggregation system is replaced by a *portal* that is a collection of one to three portal systems.

Spanning Tree

The SWMRE Spanning Tree support are a combination of these modules:

- Spanning Tree Protocol (STP)
- Rapid Spanning Tree Protocol (RSTP)

  Multiple Spanning Tree Protocol (MSTP)

The following highlights the features of the Spanning Tree Protocol modules.

Note: All SWMRE spanning tree modules support 802.3x flow control, broadcast storm recovery, and port mirroring.

Spanning Tree Protocol (802.1d)

The SWMRE Spanning Tree Protocol (STP) module creates spanning trees within mesh networks of Layer 2 connected bridges, disabling any links that are not a part of the tree and leaving a single active connection between any two unique network nodes.

STP devices exchange BPDU (bridge protocol data unit) messages. The Spanning Tree Algorithm calculates the best path and prevents multiple paths between network segments. STP elects a root bridge, finds paths and determines the least cost path to the root bridge, then disables all other paths.

Network managers may design a topology that uses redundant links as automatic backup paths in the case of active link failure. Automatic backup takes place without the pitfalls of bridge loops, or the need to manually enable or disable backup links.

SWMRE STP supports all STP switch port states, including:

- Listening, learning, blocking, forwarding, disabled

For more information about the Spanning Tree modules, see the *Layer 2 Developer Guide*.

Rapid Spanning Tree Protocol (802.1w)

The Rapid Spanning Tree Protocol (RSTP) accelerates the re-configuration and restoration of a spanning tree after a link failure.

Multiple Spanning Tree Protocol (802.1s)

The Multiple Spanning Tree Protocol (MSTP) is a supplement to the IEEE 802.1ad standard. MSTP allows VLAN bridges to use multiple spanning trees, by providing the ability for traffic belonging to different VLANs to flow over potentially different paths within the virtual bridged LAN.

Data Center Bridging

Data Center Bridging (DCB) is a collection of standards-based extensions for Ethernet protocols. DCB is a lossless transport layer to allow the convergence of LANs and SANs into a single unified fabric. DCB is a flexible framework that defines the capabilities required for switches and end-points to be part of a data center environment. DCB protocols can carry Fibre Channel, TCP/IP, and Inter-process communication traffic over a single, converged Ethernet network.

SWMRE DCB provides these key benefits:

- Enables Fibre Channel over Ethernet (FCoE) to make possible the migration of SANS to more cost-effective Ethernet
- Enables high-speed connections over Carrier Ethernet between geographically dispersed data centers

Data center networks and backplane fabrics employ applications that depend on the delivery of data packets with a lower latency and lower probability of packet loss than is typical of IEEE 802 VLAN bridged networks. DCB supports the use of a single bridged local area network for these applications, as well as traditional LAN applications.

DCB features include:

- Lossless fabric for traffic on converged networks
- Virtual links by traffic class that includes pause-per-class technology, congestion management and event notification
- Improved performance, including stability, enhanced throughput, and robustness The following subsection highlights the features of DCB.

For more information about DCB, see the *Data Center Bridge Developer Guide.*

Priority-based Flow Control (IEEE 802.1Qbb)

The Priority-based Flow Control (PFC) standard specifies protocols, procedures and managed objects that enable flow control per traffic class on full-duplex links. Priority-based flow control helps eliminate frame loss due to congestion by operating on individual priorities. Along with other Data Center Bridging technologies, PFC helps the flow of higherlayer protocols, which are highly loss sensitive, while not affecting traditional LAN protocols that utilize other priorities. Data Center Bridging networks (bridges and end-nodes) include limited bandwidth-delay product and limited hop count.

VLAN tag priority values identify traffic classes. Priority-based flow control helps eliminate frame loss due to congestion by a mechanism similar to the IEEE 802.3x PAUSE, but operates on individual priorities.

Enhanced Transmission Selection (IEEE 802.1Qau)

The Enhanced Transmission Selection (ETS) standard supports the allocation of bandwidth among traffic classes. When the available load in a traffic class does not use its allocated bandwidth, ETS allows other traffic classes to use available bandwidth.

A network can prioritize traffic to offer different service characteristics to different traffic classes. However, a user may want to share bandwidth among the priorities that are carrying bursty, high-offered loads, instead of servicing them with a strict priority. Therefore, traffic set at a specific priority level that does not use its set allocation allows traffic set at other priorities to utilize the unused bandwidth.

Data Center Bridging eXchange (DCBx)

The Data Center Bridging eXchange (DCBx) protocol is used by DCB-enabled devices to exchange information with directly connected peers. The DCBx may also be used to detect mis-configurations and to configuring the peers. DCBx uses the Link Layer Discovery Protocol (LLDP) as a signaling mechanism.

Quantized Congestion Notification (802.1Qau)

Quantized Congestion Notification (QCN) addresses the problem of sustained congestion by moving corrective action to the network edge.

Port Authentication (authd)

The SWMRE Layer 2 802.1x module provides port-based network access control for LAN devices. The IEEE 802.1x standard offers centralized control of user authentication and access.

Precision Time Protocol

The Precision Time Protocol (PTP) is a protocol used to synchronize clocks throughout a computer network. On a local area network, PTP achieves clock accuracy in the sub-microsecond range, making it suitable for measurement and control

systems. PTP (IEEE 1588v2) introduced the concept of “boundary clocks” and “transparent clocks” that serve to further improve system and network scalability and the accuracy of clock synchronization.

PTP is an event-based protocol for time synchronization. PTP allows a better precision than other time synchronization protocol because of its “on-path support” and precision in sending the exact timestamp. On-path support in PTP is provided through boundary and transparent clocks. Boundary clocks synchronize time to the grandmaster and transmit it further on the network. There is no need for the grandmaster to send synchronization messages to all slave clocks. Boundary clocks in between can act as master.

Transparent clocks do not synchronize with the grandmaster or master. They just add correction to the timestamp by taking into account link delays and residence time.

For more information about PTP, see the *Precision Time Protocol Developer Guide.*

Synchronous Ethernet

Packet-switching networks such as Ethernet were designed to transport asynchronous data where strict synchronization is not needed because traffic is highly buffered. However, with Carrier Ethernet evolution, Ethernet is replacing the SONET/SDH/PDH infrastructure and carrying TDM traffic. This means that packet networks need frequency synchronization functions, especially at their edge. The adaptation of TDM signals into a packet network is called Circuit Emulation Services (CES). Synchronous Ethernet (SyncE) is an evolution of conventional Ethernet with SONET/SDH/PDH-based synchronization. Synchronous Ethernet is used to synchronize and send frequency information to nodes on the network. Synchronous Ethernet provides only frequency synchronization, not time or phase synchronization.

In Synchronous Ethernet, a reference-timing signal traceable to a Primary Reference Clock (PRC) is injected into the network element using an external clock port. The Synchronous Ethernet interface extracts the frequency of this reference-timing signal and locks it to a system clock. This reference frequency is distributed to downstream Synchronous Ethernet nodes. Using this method, timing originating from a PRC is distributed via the intermediate Ethernet equipment clocks (EEC), to the other nodes in the network.

For more information about SyncE, see the *Synchronous Ethernet Developer Guide.*

Shortest Path Bridging (IEEE 802.1aq)

SPB (Shortest Path Bridging) enables you to simplify how you create and configure networks—across the enterprise and for the cloud—by requiring service provisioning only at the edge of the network. Shortest Path Bridging (SPB) is a control plane protocol that combines an Ethernet data path with an Intermediate System To Intermediate System (ISIS) link state protocol running between bridges. SPB does not depend on spanning tree protocols to provide a loop-free topology, but instead uses IS-IS Link State Packets (LSPs) to discover and advertise the network topology and compute the shortest path trees from all bridges in the SPB area. RFC 6329 describes the IS-IS extensions to support 802.aq SPB.

There are two types of SPB depending on the type of Ethernet data path:

- Shortest Path Bridging - VID (SPBV) uses an 802.1ad “Q-in-Q” data path • Shortest Path Bridging - MAC (SPBM) uses an 802.1ah “MAC-in-MAC” data path For more information about SPB, see the *Shortest Path Bridging Developer Guide.*

SPB, like TRILL, uses the IS-IS link-state routing protocol to advertise both topology and logical network membership. SPB packets are encapsulated at the edge in either MAC-in-MAC 802.1ah or tagged 802.1Q/802.1ad frames and transported only to other members of the logical network. Unicast and multicast are supported and all routing is on symmetric shortest paths.

The key benefits of the SPB solution are:

- Supports thousands of multi-terabyte switches and enables a non-blocking two-tier network fabric

- Uses existing IS-IS protocol and interoperates with existing service provider equipment
- Already available through OAM, enabling service providers to quickly roll out managed services

IEEE 802.1aq can be used anywhere that Spanning Tree is currently being used. Operators can take existing STP/ MSTP-based networks and migrate to SPB.

With SPB, the data center network can be treated as one big Layer 2 switch by combining hundreds of smaller switches in a “non-blocking” topology. This big distributed switch can be used to interconnect hundreds of different customers cheaply with Layer 2 VPNs. The topology is fully compatible with all 802.1 data center bridging protocols. OAM (Operation, Administration, and Management) and address isolation is provided through MAC-in-MAC.

Edge Virtual Bridging

Software switches cannot achieve the level of network capabilities built into enterprise-class Layer 2 data center switches. To solve the management challenges with Virtual Ethernet Bridging (VEB), Edge Virtual Bridging (EVB) was developed with a primary goal to combine the best of VEBs with the best of external Layer 2 network switches.

EVB is based on VEPA (Virtual Ethernet Port Aggregator) technology. EVB enables the virtual switches to send all traffic and forwarding decisions to an adjacent physical switch. This moves the forwarding decisions and network operations from the host CPU to the switch. EVB also leverages the advanced management capabilities in the access or aggregation layer switches.

For more about EVB, see the *Edge Virtual Bridging Developer Guide.*

Ethernet Automatic Protection Switching

Ethernet Automatic Protection Switching (APS) detects signal failure or signal degrade on a working channel and switches traffic transmission to a protection channel.

Ethernet Linear Protection Switching

Ethernet Linear Protection Switching (ELPS) as defined by ITU-T G.8031 (2007) specifies these techniques:

- Linear 1+1 (One-plus-One) protection switching operates with either uni-directional or bi-directional switching; normal traffic is copied and fed to both working and protection transport entities
- Linear 1:1 (One-to-One) protection switching operates with bi-directional switching; normal traffic is transported either on the working transport entity or on the protection transport entity, using a selector bridge at the source For more about ELPS, see the *Carrier Ethernet Developer Guide*.

Ethernet Ring Protection Switching

Ethernet Ring Protection Switching (ERPS) protects Ethernet traffic in a ring topology by ensuring that no loops are within the ring. Loops are prevented by blocking traffic on either a predetermined link or a failed link. ERPS integrates Ethernet Operations, Administration, and Maintenance (OAM) functions with a simple APS protocol. An Ethernet ring uses normal learning, forwarding, filtering, and flooding mechanisms and a forwarding data base (FDB).

SWMRE supports multiple Ethernet ring instances, in accordance with ITU-T G.8032 (2012).

For more about ERPS, see the *Carrier Ethernet Developer Guide*.

Ethernet Local Management Interface

Ethernet Local Management Interface (E-LMI) is an OAM (Operation, Administration, and Management) protocol used for communications between two User Network Interfaces (that is, UNI-C and UNI-N). E-LMI provides both UNI and

EVC (Ethernet Virtual Connection) status information to customer edge (CE) devices. This information enables automatic configuration of CE operation based on the Metro Ethernet Network configuration. The SWMRE E-LMI module follows the Metro Ethernet Forum 16 specification.

For more about E-LMI, see the *Ethernet Local Management Interface Developer Guide*.

Remote Monitoring

Remote monitoring (RMON; defined by RFC RFC 2819) provides remote monitoring and management of network devices and enables these devices to communicate with each other to exchange network information.

For more about RMON, see the *Layer 2 Developer Guide*.

Layer 3 Protocols

SWMRE supports both IPv4 and IPv6 versions of:

- Border Gateway Protocol
- Open Shortest Path First
- Routing Information Protocol
- Intermediate System to Intermediate System
- Virtual Router Redundancy Protocol
- Bidirectional Forwarding Detection

Figure 2-5 shows how Layer 3 routing protocols interact with the Unicast Routing Information Base Daemon and Network Services Module.

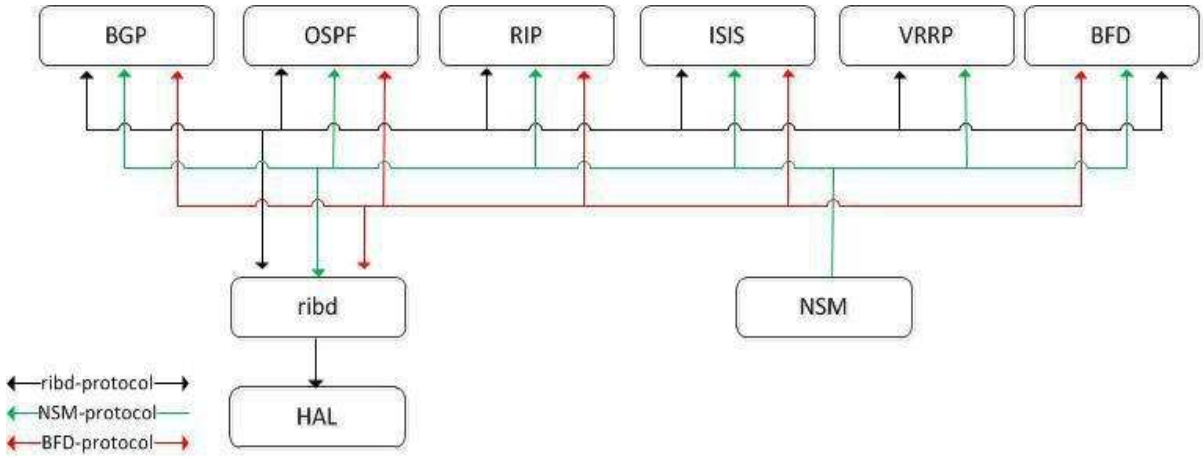

Figure 2-5: Layer 3 routing architecture

The protocol modules communicate with Network Services Module for interface updates and with the Unicast Routing Information Base Daemon for route updates and redistributed routes.

In addition to the standard Layer 3 routing protocols, SWMRE offers:

- Virtual Routing (VR) support
- Traffic Engineering (TE) extensions
- Constrained Shortest Path First (CSPF) topology support for the Open Shortest Path First (OSPF) and Intermediate System-to-Intermediate System (IS-IS) protocols

Unicast Routing Information Base Daemon

In SWMRE, the unicast Routing Information Base daemon (`ribd`) is responsible for maintaining a central unicast Routing Information Base.

A Routing Information Base (RIB) is a data structure stored in a network device that lists the routes to particular network destinations and metrics (distances) associated with those routes. A RIB contains information about the topology of the network immediately around it. Maintaining a RIB by discovering network topology is the primary purpose of dynamic routing protocols such as BGP, RIP, and OSPF. Static fixed routes are added to a RIB by commands. (A RIB is also called a routing table.)

A Forwarding Information Base (FIB) is used to find the proper interface to which an input interface should forward a packet. In contrast to RIBs, FIBs are optimized for fast lookup of destination addresses. (A FIB is also called a forwarding table.)

Protocol modules create their own routes, and communicate this protocol-specific information to `ribd` via InterProcess Communication (IPC) messaging functions. The `ribd` RIB contains all routing information received from routing peers, for example, destination prefix, nexthop information, and distance. Figure 2-6 shows how the Layer 3 protocols, `ribd`, and the kernel communicate.

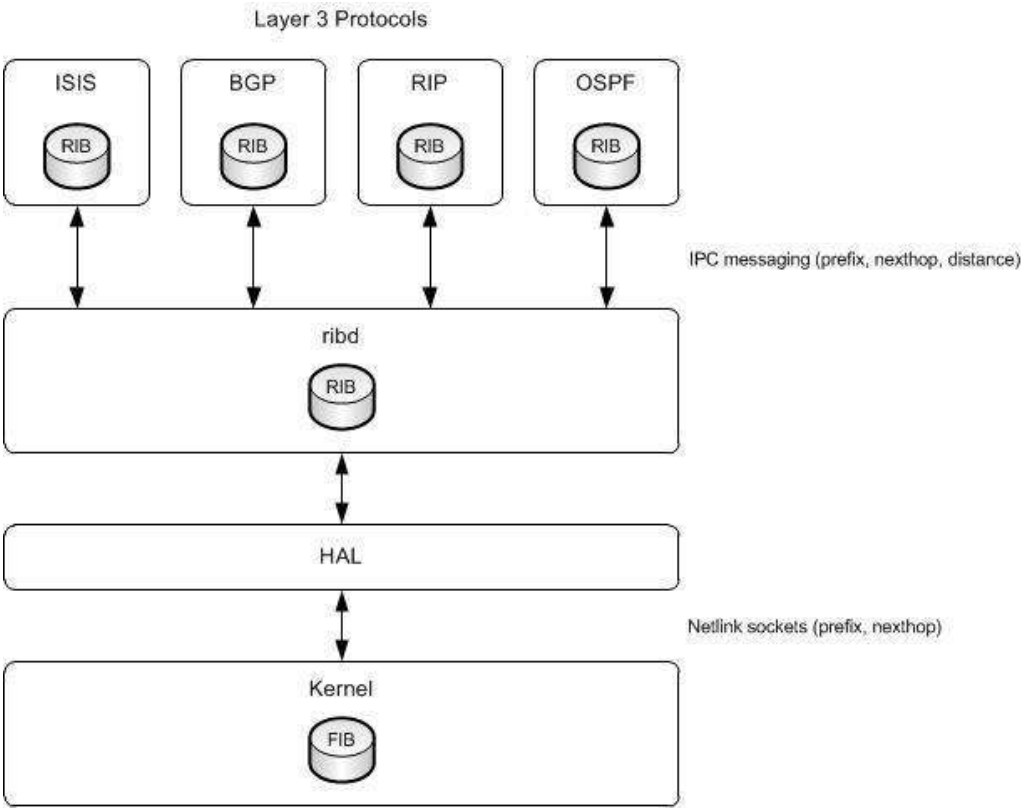

Figure 2-6: Protocol, ribd, and kernel interaction The

tasks of the `ribd` daemon are to:

- Communicate with SWMRE routing and switching modules to get routing information updates
- Provide configuration for static routes
- Process the routing information and maintain all the received routes from clients as part of the RIB • Maintain the FIB
- Process the routes and select the FIB route and program the kernel.

- Redistribute routes
- Handle interface up and down events

For every known prefix, `ribd` maintains a route node entry in its RIB. The `ribd` process populates this table upon receiving routes from:

- Protocols such as BGP, OSPF, and RIP
- Static routes configured using commands
- The kernel FIB
- Connected routes derived from interface information

Routing protocols use different metrics to calculate the best path for a destination. The best path is sent to the `ribd` process.

The kernel FIB contains the minimum amount of information required to make a forwarding decision on a particular packet, for example, destination prefix and nexthop information. This abbreviated form of the information in the RIB is transferred from `ribd` to the kernel FIB via Netlink sockets.

For more about the ribd daemon, see the *Unicast Routing Information Base Developer Guide*.

Border Gateway Protocol

Border Gateway Protocol (BGP) is a core exterior gateway protocol (EGP) used on the Internet. BGP maintains a table of IP networks, or prefixes, which designate network reachability among Autonomous Systems (AS). BGP is a pathvector protocol that makes routing decisions based on path, network policies, and/or rule sets.

SWMRE supports Border Gateway Protocol (BGP4+) versions 4 and 4+ and offers optional VPN extensions for MPLS-VPN support. The VPN extensions work with NSM, MPLS-LDP, RSVP-TE, and MPLS forwarder modules.

SWMRE BGP4+ features include:

- IPv4 and IPv6 support
- Route Reflection
- Route Refresh
- Community Attributes
- Community Attributes in Multi-Home Routing
- Extended Communities
- Protection of BGP Session via the TCP MD5 Signature Option
- Capabilities Advertisement
- Route Flap Damping
- E-BGP Multi hop
- Stateful implementation
- Multi-protocol BGP extensions
- BGP/MPLS VPNs
- BGP Graceful restart
- BGP4+ Inter-Domain Routing (IDR):
- Virtual Routing and Virtual Routing and Forwarding Support
- Full MIB support

For more information about BGP, see the *Border Gateway Protocol Developer Guide.*

Open Shortest Path First

Open Shortest Path First (OSPF) version 2 is a link-state routing protocol that runs internally on a single autonomous IPv4 system. Each router designated to run OSPF maintains an identical database describing the autonomous system's topology. From this database, a routing table is calculated by constructing a shortest-path tree. OSPF version 3 contains extensions to support IPv6 networks. The protocol is also extensible to other address families. SWMRE supports the following OSPF standards:

SWMRE OSPF features include:

- Opaque Link State Attributes (LSA)
- Multiple Instance Support
- Intra- and inter-area routing
- Type 1/2 external routing
- OSPF “not so stubby area” (NSSA) Option
- Inter domain Routing Protocol (IDRP) for IP-OSPF Interaction
- Opaque link state availability (LSA) Option
- Manual and automatic virtual links
- Equal Cost Multi Path (ECMP)
- Broadcast, point-to-point and point-to-multi-point models
- MD5 authentication
- Incremental SPF
- Traffic Engineering extensions
- Virtual Routing (VR) and Virtual Routing and Forwarding (VRF) support
- Graceful restart
- Full MIB support
- Optional Virtual Private Network (VPN) support
- Optional Constrained Shortest Path (CSPF) support

For more information about OSPF, see the *Open Shortest Path First Developer Guide.*

Routing Information Protocol

The Routing Information Protocol (RIP) version 2 is one of the most commonly used interior gateway protocols (IGP) for routing on internal IPv4 networks, and to a lesser extent, networks connected to the Internet. RIP employs a distributed variant of the Bellman-Ford algorithm to provide distance vector routing capabilities. RIP also supports subnet information, thus allowing Classless Inter-domain Routing (CIDR).

RIPng contains extensions to support IPv6 networks.

SWMRE RIP/RIPng features include:

- Split horizons with poisoned reverse
- Triggered updates
- ECMP (Equal Cost Multi path Routing) support
- Virtual Routing and Virtual Routing and Forwarding Support

- Full MIB support

For more information about RIP, see the *Routing Information Protocol Developer Guide.*

Intermediate System to Intermediate System

Intermediate System-to-Intermediate-System (IS-IS) is a link-state routing protocol that runs internally on a single autonomous system. IS-IS routers maintain identical databases that describe the autonomous system's topology. A routing table is calculated from the database by constructing a shortest-path tree.

SWMRE IS-IS features includes:

- Traffic Engineering extensions
- IS-IS MIB support
- Multi-protocol support for IPv4 and IPv6
- Equal cost Multi path
- Dynamic Host name Exchange Mechanism
- IS-IS Mesh Groups
- Traffic Engineering
- Restart Signaling
- Multi-topology routing
- Virtual Routing and Virtual Routing and Forwarding Support

For more information about IS-IS, see the *Intermediate System and Intermediate System Developer Guide.*

Virtual Router Redundancy Protocol

The Virtual Router Redundancy Protocol (VRRP) allows a virtual router composed of two or more VRRP routers on the same subnet to prevent failure by providing at least one standby virtual router if the master virtual router fails. VRRP eliminates the single point of failure most common in a static default routed environment.

In SWMRE, VRRP functions are handled by the `vrrpd` daemon whose tasks are to:

- Bring up or down VRRPv4 or VRRPv6 sessions in the respective VR mode
- Create and delete VRRP sessions dynamically
- Transmit and receive VRRP packets to and from the virtual-router peers based on the time-out value or the current state of the VRRP router and performs functions related to the VRRP Finite State Machine (FSM).

VRRP specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP routers on a LAN. The VRRP router controlling the IP addresses associated with a virtual router is called the master, and it forwards packets sent to these IP addresses. The election process manages dynamic fail-over in the forwarding responsibility should the master become unavailable. Any of the virtual router's IP addresses on a LAN can then be used as the default first-hop router by end-hosts. The advantage of using VRRP is a higher availability default path without requiring configuration of dynamic routing or router discovery protocols on every end-host.

The NSM client code in the VRRP daemon handles updates from NSM and builds the local interface table. The VRRP master sends the VIP and VMAC to HSL which is installed in the kernel. This allows the master to process the forward the traffic sent to VRRP Virtual Router.

SWMRE supports VRRP as specified in RFC 5798.

For more information about VRRP, see the *Virtual Router Redundancy Protocol Developer Guide.*

Bidirectional Forwarding Detection

Bidirectional Forwarding Detection (BFD) reduces the reliance upon the relatively slow Hello mechanism in routing protocols to detect failures where no hardware signaling is available to assist. BFD works with BGP, OSPFv2, and ISIS to enable them to configure BFD sessions, and for the sessions to receive the bidirectional forwarding failure notifications.

BFD provides the following features:

- A single mechanism to detect liveliness over any media and in any protocol layer
- Rapid detection of communication failures between adjacent systems to quickly establish alternative paths
- Passive, Active, Synchronous, Asynchronous, and Demand modes of operation
- Improved system performance when faster detection is required, because data-plane reachability detection is detached from control-plane functionality
- A separate process that works in tight conjunction with routing protocols and NSM to detect forwarding plane reachability to protocol next hops
- SWMRE protocol modules support BFD irrespective of where BFD packet-sending operations take place: in the interfaces, data links, or to some extent, in the forwarding engines themselves
- BFD is Graceful-Restart unaware: whenever BFD timers expire, a session-down event is triggered to the protocol module, and BFD maintains sessions for the protocol while it undergoes Graceful Restart
- A fast mechanism to detect liveliness of static next-hops

For more information about BFD, see the *Bidirectional Forwarding Detection Developer Guide.*

Equal Cost Multi-Path

Equal-Cost Multi-Path (ECMP) is a forwarding mechanism for routing packets along multiple paths of equal cost and ensures load balancing across multiple paths. The SWMRE implementation leverages Forwarding Plane Load Balancing. Link-state protocols which use a cost-based metric such as OSPF and ISIS explicitly allow ECMP routing.

SWMRE installs the maximum number of ECMP routes supported by a kernel. This allows for load balancing to be performed with more than one nexthop to reach a destination. If the router receives and installs multiple paths with the same administrative distance and cost to a destination, load-balancing is possible.

IPv6 Transition

With SWMRE, you can integrate into your existing gateways and Customer Premises Equipment (CPE), protecting your network investment. ISPs and other access providers require a migration strategy to enable them to continue to provide full connectivity throughout the transition to IPv6. The is applicable for both new IPv6-based services and existing IPv4 services moving to IPv6 with:

- IPv6 Rapid Deployment provides IPv6 tunnels over existing IPv4 access network between your CPEs and your gateways to provide your customers secure access to IPv6 networks and services.
- IPv4 Residual Deployment provides stateless IPv4 over IPv6 tunnels for your existing IPv4 customers with efficient global IPv4 address sharing. The advantage of stateless tunneling is that it does not require managing per user state; abusive users can easily be identified. Furthermore, stateless tunneling simplifies high availability and scalability of the gateway since the need to scale is only based on traffic volume.

Multicast Protocols

SWMRE provides these multicast protocol daemons:

- Layer 2 Multicast Routing Information Base Daemon
- Layer 3 Multicast Routing Information Base Daemon
- Protocol-Independent Multicast Daemon
- Multi Protocol Label Switching Protocols

Layer 2 Multicast Routing Information Base Daemon

The responsibilities of Layer 2 multicast Routing Information Base daemon (`l2mribd`) include:

- Updates hardware with snooping information.
- Interacts with NSM, for bridge, VLAN, and port related information and their association with each other.
- Interacts with MSTP for spanning tree related information.
- Interacts with MSTP to receive VLAN-to-instance mapping and TCN messages.
- Communicates with the `mribd` daemon to receive IGMP status on the VLANs. If IGMP is enabled on a VLAN, IGMP snooping functionality is disabled and vice versa.
- Processes IGMP and MLD packets and maintains group membership for all interfaces based on which multicast traffic forwarding is done. It also add/deletes the group membership information in hardware.

Figure 2-7 shows the Layer 2 multicast architecture.

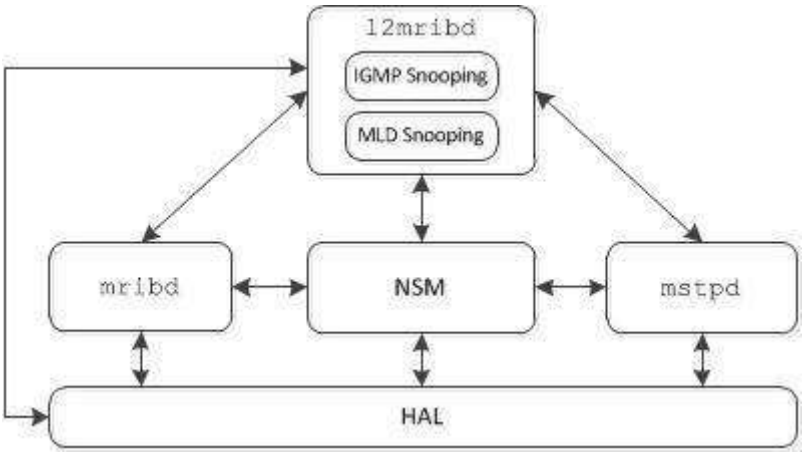

Figure 2-7: Layer 2 multicast architecture

The Layer 2 multicast modules support IPv4 or IPv6, or combination IPv4 and

IPv6. The features of the `l2mribd` daemon include:

- Internet Group Management Protocol (IGMP) Snooping: ability to passively snoop on IGMP packets to learn the IPv4 multicast group membership information. With IGMP snooping, multicast traffic in a group is only forwarded to ports that have members in that group. SWMRE supports IGMP snooping functionality for IGMP versions 1, 2, and 3.
- Multicast Listener Discovery (MLD) Snooping: ability to passively snoop on MLD packets to learn the IPv6 multicast group membership. With MLD snooping, multicast traffic is only forwarded to ports that request receipt of packets from the source. SWMRE supports MLD snooping functionality for MLD versions 1 and 2

For more information about Layer 2 multicast support, see the *Multicast Protocol Developer Guide.*

Layer 3 Multicast Routing Information Base Daemon

The multicast protocols communicate with the `mribd` daemon which communicates with the multicast forwarder. A common multicast routing information base allows multiple multicast protocols to function simultaneously.

Figure 2-8 shows the Layer 3 multicast architecture of SWMRE. The `mribd` daemon holds the multicast RIB and consolidates the routes from multicast routing protocols such as Protocol-Independent Multicast Daemon and Multi Protocol Label Switching Protocols and installs them in the kernel and sends them to HSL to install in the hardware. NSM provides the VR/VRF as well as the interface updates to the `mribd` daemon, the `pimd` daemon, and the kernel multicast forwarder.

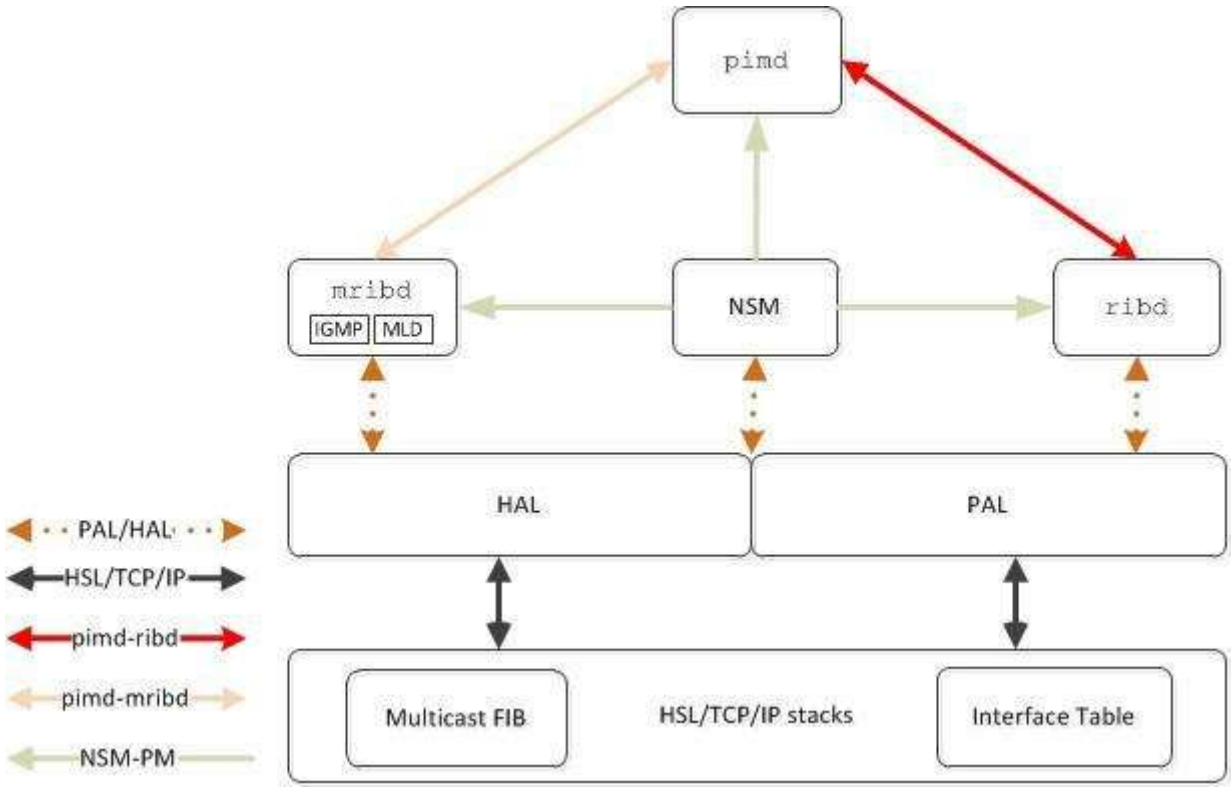

Figure 2-8: Layer 3 multicast architecture The

`mribd` daemon supports the following functions:

- Adds, deletes, and updates multicast routes in the route table and programs the kernel
- Multicast Virtual Interface (VIF) management for IPv4 networks
- Multicast Interface (MIF) management for IPv6 networks
- Multicast Route Entry management for IPv4 and IPv6
- Multicast Forwarder Event handling for IPv4 and IPv6
- Multicast Forwarding Entry statistics for IPv4 and IPv6
- Multicast Tunnel management for IPv4 only
- IGMP versions 1, 2, and 3 services (IPv4): Used by IP hosts and adjacent multicast routers to establish multicast group memberships
- IGMP Proxy

- Signals IGMP membership to multicast routing protocols like PIM
- MLD versions 1 and 2 services (IPv6): used by a by a device to discover listeners for a specific multicast group in the same manner as IGMP is used in IPv4
- MLD Proxy

For more information about Layer 3 Multicast, see the *Multicast Protocol Developer Guide.*

Protocol-Independent Multicast Daemon

Protocol-Independent Multicast (PIM) is a family of multicast routing protocols for IP networks that provides one-tomany and many-to-many distribution of data over a network. PIM is termed *protocol-independent* because it does not have its own topology discovery mechanism, but instead uses routing information supplied by other routing protocols.

SWMRE support these variants of PIM:

- PIM Sparse Mode (PIM-SM: RFC 4601) efficiently establishes distribution trees across wide area networks (WANs) by routing packets to multicast groups. PIM-SM constructs a tree from each sender to the receivers in a multicast group and packets from the sender follow the tree to interested recipients. PIM-SM is for situations where multicast groups are thinly populated across a large region. Although it can operate in LAN environments, it is most efficient in WAN environments.
- PIM Dense Mode (PIM-DM: RFC 3973) is a data-driven routing protocol that builds source-based multicast distribution trees that operate on the flood-and-prune principle. PIM-DM uses dense multicast routing and implicitly builds shortest-path trees by flooding multicast traffic domain wide, and then pruning back branches of the tree where no receivers are present. PIM-DM effectively distributes data to target recipients in a concentrated area. PIM-DM is straightforward to implement but generally has poor scaling properties.
- PIM Source-Specific Multicast (PIM-SSM: RFC 3569) is a subset of PIM-SM that allows deployment of SSM in a network with hosts that do not support IGMP version 3. PIM-SSM builds trees that are rooted in just one source, offering a more secure and scalable model for a limited amount of applications (mostly broadcasting of content). In PIM-SSM, an IP datagram is transmitted by a source S to an PIM-SSM destination address G, and receivers can receive this datagram by subscribing to channel (S,G).
- Bidirectional PIM (BIDIR-PIM: RFC 5015), is a variant of PIM-SM which dispenses with both encapsulation and source state by allowing packets to be natively forwarded from a source to the RP using shared tree state. These benefits can be observed when using a Many-Many multicast deployment.

The `pimd` daemon holds the PIM states and takes care of PIM packet processing. The `pimd` daemon also holds the Tree Information Base (TIB) with all multicast routes. The `pimd` daemon operations include:

- Interacts with NSM for interface updates
- Receives local group membership information from IGMP (MRIB). Installs multicast interfaces (VIF) and multicast routes to MRIB.
- Processes PIM packets from PIM neighbor routers The PIM features are:
- Any Cast RP
- Bootstrap router
- PIM MSDP • PIM border

For more, see the *Protocol Independent Multicasting Developer Guide*.

Multi Protocol Label Switching Protocols

Multi-Protocol Label Switching (MPLS) operates at a layer operated between traditional definitions of Layer 2 (data link layer) and Layer 3 (network layer). The MPLS modules provide integration into enterprise, edge, and core communications equipment.

The SWMRE MPLS module supports the following protocols and features:

- Label Distribution Protocol
- Traffic Engineering
- Resource ReSerVation Protocol-Traffic Engineering
- Differentiated Services
- Layer 2 Virtual Private Network
- Layer 3 Virtual Private Network
- MPLS-TP Operation, Administration and Management

For more information about MPLS, see the *Multi Protocol Label Switch Developer Guide*

Figure 2-9 shows the MPLS high-level architecture.

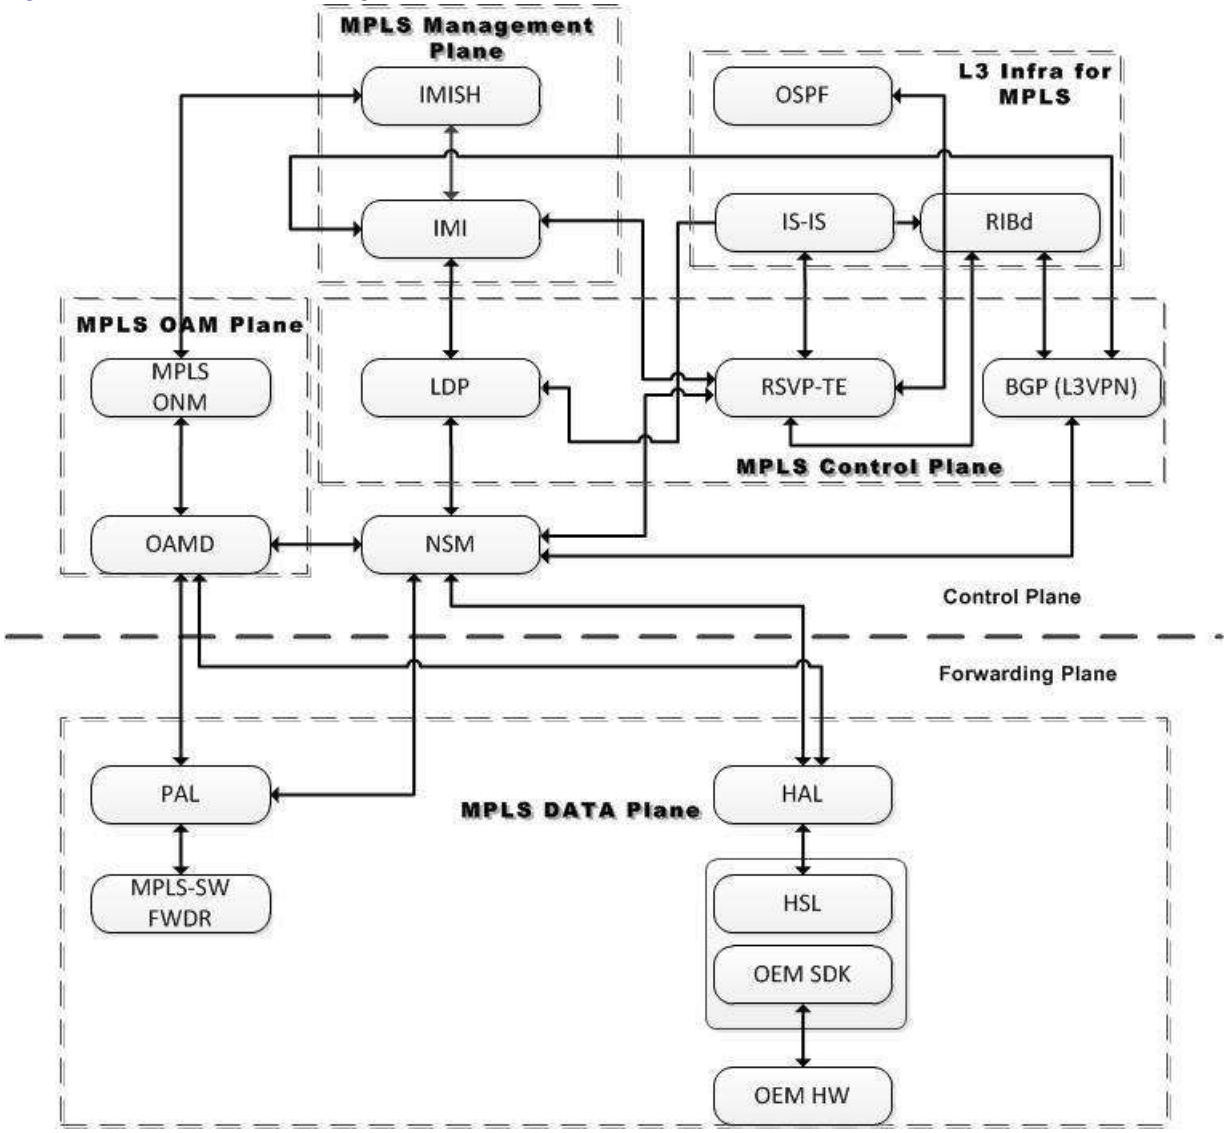

Figure 2-9: MPLS High Level Architecture

The following summarizes the architecture.

- IMISH: Provides the commands to configure the MPLS/MPLS-TP on-demand OAMs. This module interacts with the MPLS ONM to interface with the OAMD module to configure an on-demand OAM.
- MPLS ONM: Interface between IMISH and OAMD, which performs the OAM functionality. The OAMD uses the MPLS ONM to send the results of an active on-demand OAM session to IMISH to display the results to the enduser.
- OAMD: Performs on-demand and proactive OAM activities. It also provides the configuration and show commands for all proactive OAMs. This module interacts with NSM when the MPLS/MPLS-TP transport path information is required to transmit an OAM payload and to act on a received OAM payload. It uses PAL to send and receive the OAM payloads via the MPLS software forwarder.
- NSM: Houses all the MPLS/MPLS-TP transport path information. It handles the OAMD module, providing the required transport path information for OAM payload transmission and reception.

- LDP: Distributes labels between peers to form a Label Switched Path (LSP). NSM houses the MPLS Routing Information Base. LDP sends FTN/ILM obtained as result of LSP signaling to NSM. NSM installs these routes in MPLS software forwarder/hardware which will be used to forward data packets. This module also establishes LDP sessions between non-directly connected peers (T-LDP).
- RSVP-TE: Establishes traffic engineered label switched path. RSVP-TE queries CSPF to compute the explicit routes. Similar to LDP, RSVP-TE also sends FTN/ILM to NSM and NSM installs in MPLS software forwarder/ hardware.
- PAL: Interface between the OAMD and the MPLS software forwarder. It provides the necessary APIs to OAMD to send the OAM payloads to the MPLS software forwarder. It also aids the OAMD in registering for callbacks required to process incoming OAM payloads.
- MPLS software forwarder: Transmits OAM payloads received from OAMD over an MPLS/MPLS-TP transport path. This module also de-multiplexes any MPLS/MPLS-TP OAM payload received over a transport path and sends it to the OAMD for further processing.

Label Distribution Protocol

With the Label Distribution Protocol (LDP), two label-switched routers (LSR) exchange label mapping information. The two LSRs are called LDP peers and the exchange of information is bi-directional. LDP is used to build and maintain databases of LSRs that are used to forward traffic through MPLS networks.

LDP works with other routing protocols (RIP, OSPF, and BGP) to create the label-switched paths (LSP) used when forwarding packets. An LSP is the path taken by all packets that belong to the Forwarding Equivalence Class (FEC) corresponding to that LSP. In this way, SWMRE LDP assigns labels to every destination address and destination prefix provided by the `ribd` daemon. The LDP interface to the MPLS forwarder adds labels to and deletes labels from the forwarding tables.

Traffic Engineering

Traffic Engineering (TE) is a signaling protocol that supports explicit routing capability to establish Label-Switched Paths (LSPs) in a MPLS network. RSVP-TE creates explicitly routed paths, which might not agree with the route suggested by the Interior Gateway Protocol (IGP) such as OSPF or IS-IS.

Resource ReSerVation Protocol-Traffic Engineering (RSVP-TE) provides signaling information for traffic engineering in an MPLS network. A router that supports MPLS as either an LER or an LSR uses RSVP-TE to request quality of service (QoS) tasks from the network for a flow that a network operator has provisioned.

TE extensions use the RSVP and LDP dynamic-signaling protocols to communicate to the SWMRE MPLS forwarder or a third-party MPLS forwarder. The RSVP-TE extension enables MPLS to scale into large and complex IP-based communications equipment.

For computing explicit routes to reach the destination:

1. RSVP-TE queries Constrained Shortest Path First (CSPF) (OSPF or IS-IS) for a complete, end-to-end, explicit route based on constraints specified by the network administrator.
2. CSPF refers to the Traffic Engineering Database (TED) for computing the explicit route.
3. The resulting explicit route is used by a signaling protocol (RSVP-TE or LDP) to set up LSPs.

NSM maintains local TE parameters and it updates the TED of IS-IS and OSPF. If there is any change in TEparameters, NSM updates the same in IS-IS/OSPF. IGPs exchange the TE parameters with their peers.

MPLS for Traffic Engineering has these advantages:

- LSPs are not constrained because of destination based forwarding paradigm can be created through manually or through automatically by the underlying protocols
- LSPs can be efficiently maintained
- MPLS allows traffic aggregation and disaggregation unlike classical destination which only allows IP forwarding and permits only aggregation
- Easy integration of “constraint-based routing” framework with MPLS Figure 2-10 shows the MPLS Traffic Engineering high level architecture.

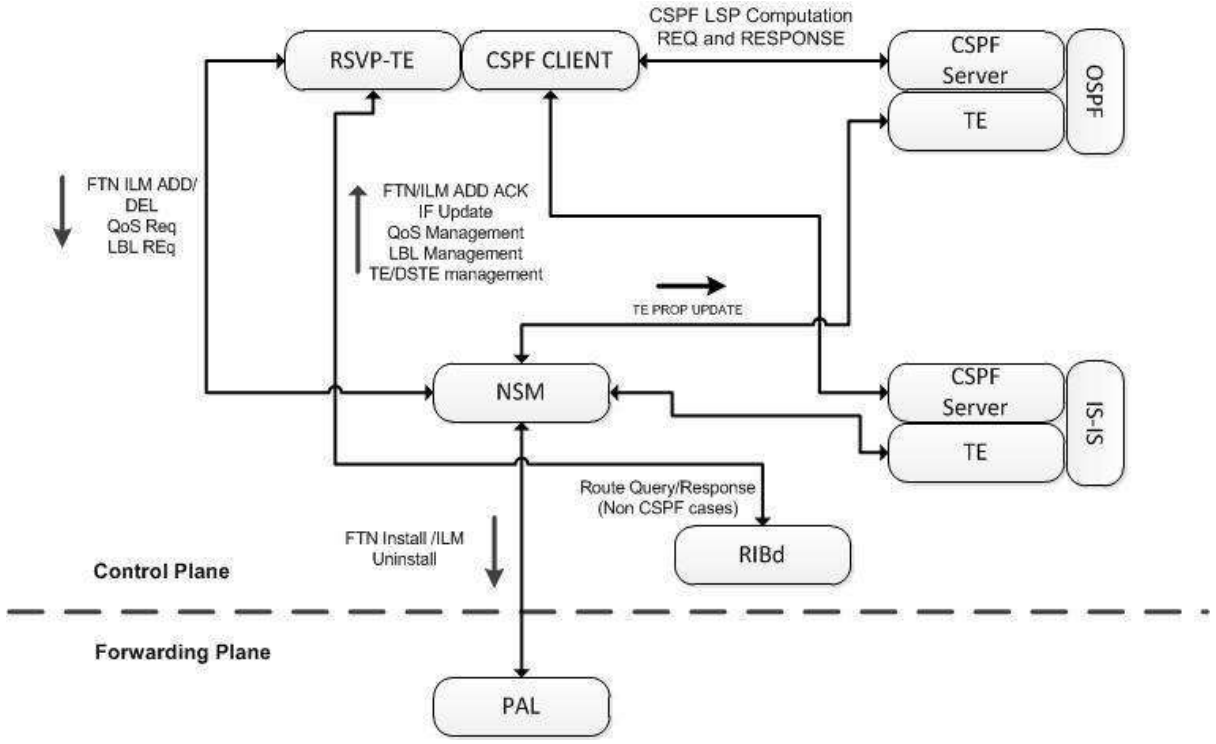

Figure 2-10: MPLS Traffic Engineering

Resource ReSerVation Protocol-Traffic Engineering

Resource ReSerVation Protocol-Traffic Engineering (RSVP-TE) communicates with the QoS module in NSM to:

- Find if the requested bandwidth is available
- Reserve bandwidth for an LSP
- Release a reserved resource

To manage labels, RSVP-TE communicates with the label pool manger in NSM. NSM provides a label block and RSVP-TE assigns a label for each LSP within the label range provided by NSM. If all labels in a label block are exhausted, RSVP queries and gets the next available label block from NSM.

- RSVP-TE gets interface up/down events from NSM
- RSVP-TE queries RIB for next hop information
- RSVP-TE sends FTN/ILM (obtained as result of LSP signaling) to NSM
- NSM maintains MPLS RIB information (FTN/ILM) and installs it in hardware

Differentiated Services

Differentiated Services (DiffServ) specifies a simple, scalable and coarse-grained mechanism to classify and manage network traffic and provides Quality of Service (QoS) guarantees for service providers. To provide a flexible DiffServeover-MPLS solution, DiffServ extends the RSVP-TE module. The DiffServ module enables network traffic to be specified and prioritized by class, so that certain kinds of traffic, for example voice traffic, attain precedence over other types of traffic.

Because DiffServ by itself lacks the ability to efficiently use network transmission resources. The DiffServ-TE module performs traffic engineering per DiffServ class, rather than at an aggregate level. By combining DiffServ with MPLS-TE, routing devices can simultaneously classify and prioritize traffic and achieve fined-grained optimization of transmission resources.

The SWMRE implementation of DiffServ supports RFC 3270 and RFC 4124.

Layer 2 Virtual Private Network

SWMRE offers MPLS Layer 2 Virtual Private Network (VPN) and Virtual Private LAN Service (VPLS) protocol modules that enhance MPLS by providing transparent LAN access between VPN sites. The VPN infrastructure for provider-edge equipment uses the IP routing, traffic engineering, and MPLS switching features of SWMRE.

Figure 2-11 shows the MPLS Layer 2 VPN high-level architecture.

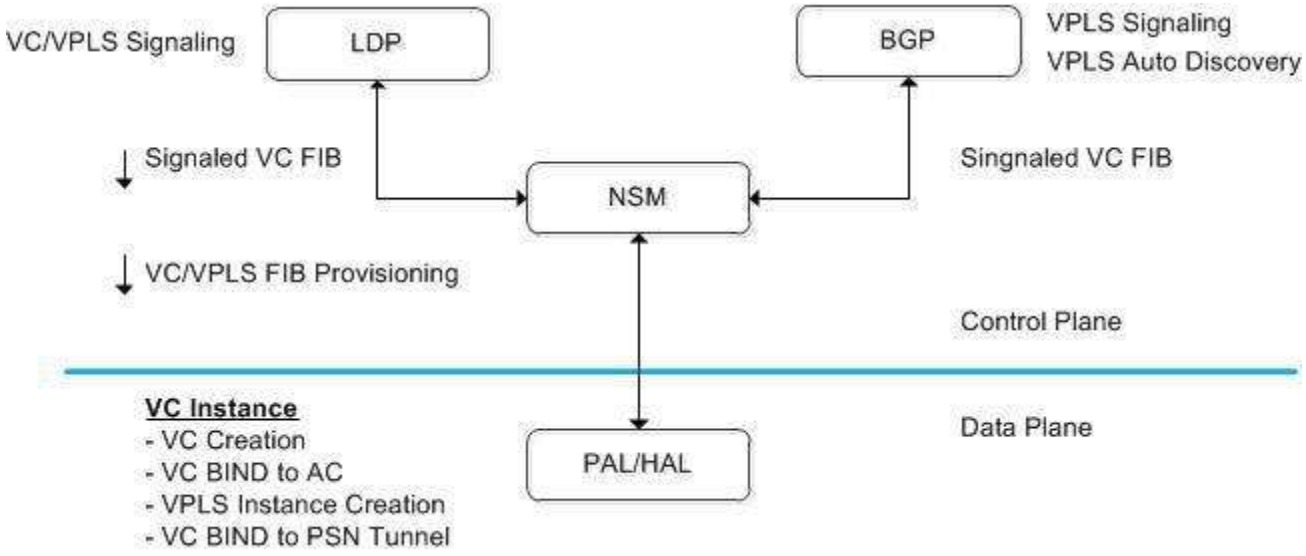

Figure 2-11: Layer 2 VPN

MPLS Layer 2 VPN provides end-to-end connection over a MPLS tunnel. Virtual Circuits (VC) addresses the problem of point-to-point VPN connections in MPLS VPNs. VPLS presents a solution for multipoint connectivity for the Layer 2 MPLS VPN.

In SWMRE, MPLS-Layer 2VPN is achieved using signaling protocols such as LDP, BGP, or by static configuration. During VC/VPLS configuration, IMI relays all the VC/VPLS configuration information to NSM. NSM creates a VC/VPLS instance and bind this instance to the attachment circuit and PSN tunnel. Additionally, NSM sends this information to LDP and BGP which starts the signals:

- LDP provides signaling of VC/VPLS information and establishes targeted session and VC label exchange. The exchanged VC labels (FIB) are then sent to NSM.
- BGP uses auto-discovery to learn peers participating in a VPLS instances. Once the peers are discovered, VC labels are exchanged. The exchanged VC labels (FIB) are then sent to NSM.

NSM maintains the VC and PSN label information and installs the FIB information in the hardware.

Note: The SWMRE Layer 2VPN solution has signaling extensions for both VPWS (Virtual Private Wire Service) and VPLS.

Layer 3 Virtual Private Network

The MPLS Layer 3 Virtual Private Network (Layer 3 VPN) is a PE-based technology for service provider VPN solutions. It uses BGP to advertise VPN routes and uses MPLS to forward VPN packets on service provider backbones. A CE first establishes adjacency with a directly connected PE and advertises its VPN routes to the PE and learns remote VPN routes from that PE. A CE and a PE use BGP/IGP to exchange routing information

The SWMRE Layer 3 MPLS-VPN solution is supported by the SWMRE MPLS forwarder and LDP modules by tightly integrating BGP-VPN extensions. It provides address space and routing separation through the use of per-VPN routing tables (VPN Routing and Forwarding) and MPLS switching in the MPLS core.

Figure 2-12 shows the MPLS Layer 3 VPN high level architecture.

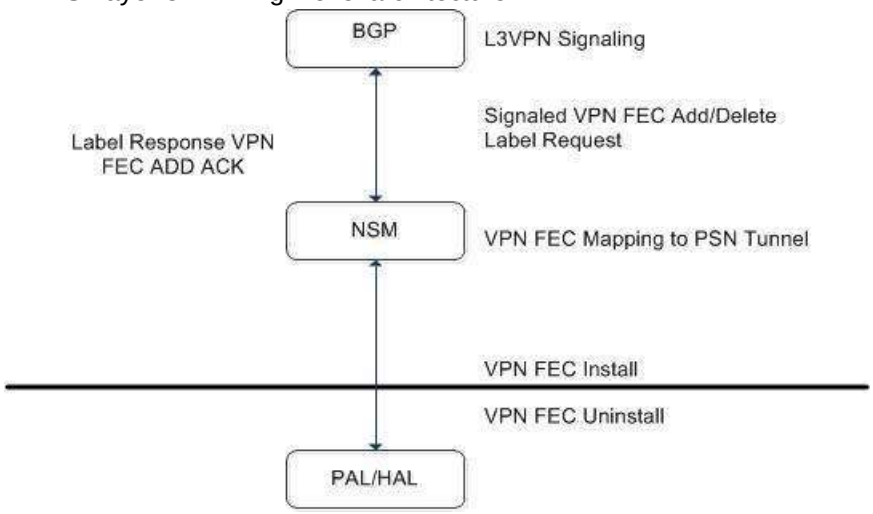

Figure 2-12: Layer 3 VPN

SWMRE supports BGP-MPLS VPNs for both IPv4 and IPv6. Customer data packets are tunneled through the backbone, so that core routers are unaware of IPv4 and IPv6 VPN routes. NSM gives the routes it has learned from IGPs to BGP. BGP allocates the labels for these prefixes and then informs its peer about these labels. BGP then interacts with NSM to install the labels in the forwarder and to map the VPN prefix to the underlying MPLS tunnel. Data traffic is encapsulated with BGP labels and sent on the MPLS tunnel.

Virtualization

SWMRE supports different virtualization concepts like Virtual Router (VR) and Multi-Tenancy (MT).

Virtual Router (VR)

The Virtual Router (VR) feature logically subdivides a physical router into multiple virtual routers, with each virtual router independently monitored and managed by the network administrator. Each VR can have multiple VRFs (Virtual Routing and Forwarding instances) supporting multiple routing tables (RIBs) co-existing within the same router at same time. A single instance of SWMRE manages all the VRs and its VRFs. SWMRE offers VR support for both IPv4 and IPv6 routing protocols.

VR/VRF with Namespaces

Multiple Forward Information Base (FIB) tables in x86 platforms (using Linux kernel versions 3.0 and later) are supported using Linux namespaces. Each VRF is essentially mapped to one network namespace which has a Forwarding Information Base. SWMRE supports the segregation of VRF routes at the control plane level which is extended to the FIB in the Linux IP stack using the namespace concept.

Multi-Tenancy

Multi-tenancy (MT) is a virtualization concept to create independent slices of a device, each of which can be individually managed and configured. Multi-tenancy is based on file system partitioning using `chroot` jails and Linux namespace support. This namespace allows the user of the Linux kernel to create multiple instances of a given resources. For example, the network namespace can be used to create multiple IP stacks.

In each tenant or logical partition, a complete instance of SWMRE control plane (Layer 3 and Layer 2) can be executed.

The high level modules in the system are:

- Logical Switch Router (LSR): A LSR is one partition of a physical switch and provides virtualization for management plane, control plane and data plane. Each LSR has an instance of the control plane processes (OSPF, BGP, RIP, STP, RIB, MRIB, NSM), management plane processes (SNMPD, IMI) and system services processes (SYSLOGD) running in the LSR under a `chroot` jail.
- Default LSR/ Privileged LSR: The default/ privileged LSR (LSR 0) is always active and enabled and can never be deleted. This LSR comprises the LSM which manages the multi-LSR eco-system.
- Logical System Manager (LSM): This module is a separate Linux process that is responsible for LSR management:
- Creating and deleting LSRs
- Setting up the environment for the LSR such as the root file system
- Loading/unloading individual processes in a LSR

  LSM is only present in the default/privileged LSR. When the LSR is created, all processes needed for the the LSR are loaded (imi, nsm, rib, mrib, syslogd, vlogd, snmpd).
- `syslogd`: Linux logger daemon. One instance of `syslogd` runs per LSR.

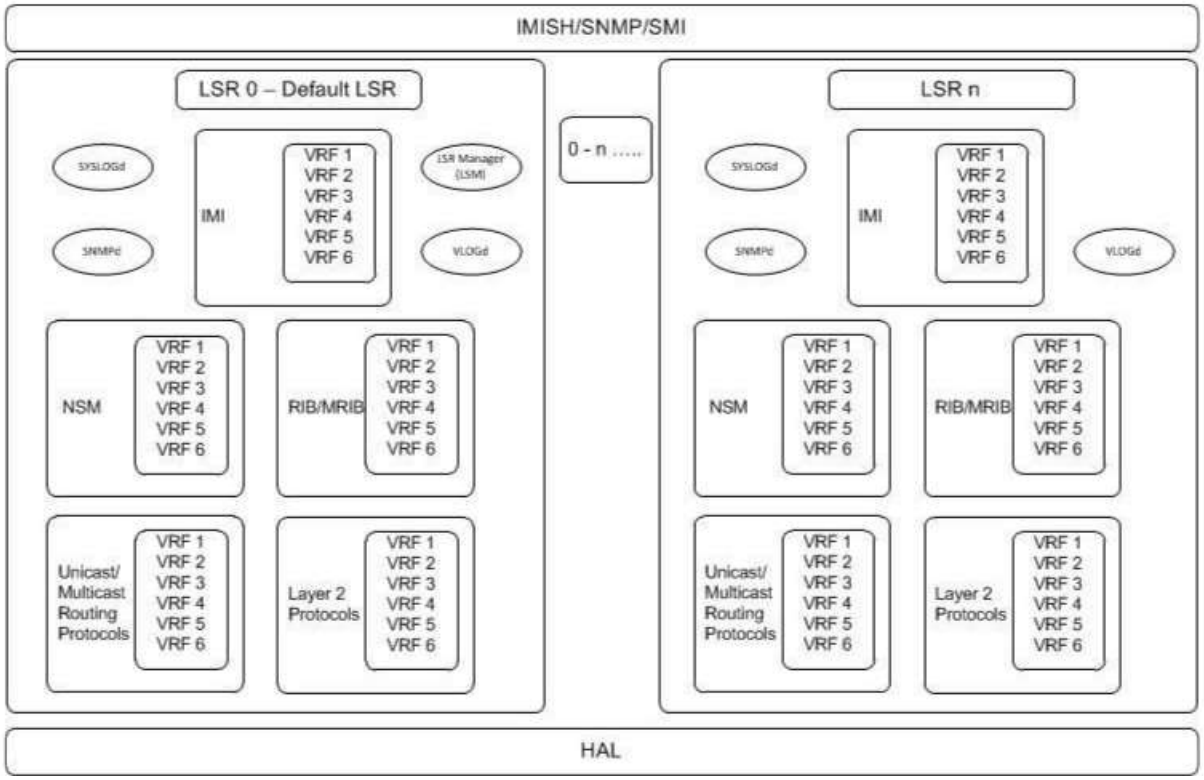

Figure 2-14: Multi-Tenancy

CHAPTER 3 SWMRE Abstraction Layers

This chapter describes the abstraction layers in SWMRE that enable hardware and software portability:

- The Platform Abstraction Layer (PAL) enables SWMRE to be ported to different operating systems and CPUs
- The Hardware Abstraction Layer (HAL) decouples the SWMRE protocol modules from the underlying data plane, enabling portability across multiple silicon switching chipsets

These abstraction layers isolate hardware and operating system specific interactions to a small set of well-defined function calls for the control plane. The abstraction layers provide a unified interface for the control plane to interact with the data plane for all Layer 2, Layer 3, multicast, and MPLS forwarding needs. The functions calls above the abstraction layer run unmodified for any switching and routing hardware platform.

Additionally, this chapter describes the Hardware Services Layer (HSL) which implements the hardware system-related functions.

Platform Abstraction Layer

SWMRE provides platform independence with the Platform Abstraction Layer (PAL) functions. The PAL functions call the system services specific to the platform to isolate SWMRE daemons from the operating system.

PAL allows SWMRE to support multiple operating systems. The complexity of each component is handled by a PAL module for each OS. This allows a SWMRE component to make an OS-independent call and then the compile-time options link the appropriate PAL module that fulfills that call.

SWMRE comes with a set of production-quality, fully-tested PAL modules for the most common operating systems. Any porting efforts to non-supported platforms can be modelled on these PAL modules.

Features

The features of PAL are as follows.

Memory Management

A memory management in PAL gives developers more control over memory, including setting the class and size of the requested storage.

Sockets

Sockets services are used to create TCP sockets. PAL sockets handle all socket functionality. For example, creating and deleting, reading and writing; and synchronizing. In addition, there are extensions to the socket calls that handle layer 2 and raw sockets.

String

The string abstraction includes string operations such as copying, scanning, parsing, and comparing. It interacts with the memory abstraction to create or move memory cells.

Standard Library

The standard library (`stdlib`) abstraction takes advantage of the most effective functions on the system. If there is an enhanced or particular functionality available for a feature, that functionality can be used in preference to the standard function.

Configuration Storage

PAL abstracts storage of configuration files. This allows platforms without a file system to store configuration information in any available memory model, including linear memory or flash memory.

Logging

Logging facilities are abstracted so that the system can log to any available facility, for example syslog, file, or console. These outputs can also run in parallel so that each output can be set independently to different log trap levels.

Interfaces and Routes

PAL abstracts kernel routes and interfaces. This allows SWMRE to not directly perceive how routes are manipulated.

Daemons

Process daemons are abstracted so that they are automatically handled on systems with this functionality.

Source

The source tree layout puts each protocol in its own directory. There is no platform-specific source in these directories. All calls, data types, and other components that are operating-system-specific or platform-specific are in subdirectories of the `pal` directory. All included modules either document other required included modules or automatically include the necessary modules.

Dummy Build Environment

A “dummy” build environment helps determine if the module include any system-dependent functions. The dummy environment excludes the system header files, and each module that builds with the dummy environment does not include any system-dependent functions. This ensures that all modules run in any PAL supported environment, even if that environment does not support the standard library feature.

Module Compatibility

Changes, additional features, and enhancements to protocols are restricted to the source for that module. Changes made necessary by a platform are restricted to the PAL module for that platform. A PAL API can change to support an operating system feature. This ensures backward compatibility for protocol modules with later versions of an API.

Hardware Abstraction Layer

As shown in Figure 3-15, the Hardware Abstraction Layer (HAL) enables the control plane to run on different hardware platforms, regardless of the type of chip set or operating system being used. Additionally, HAL makes the control plane fully independent of the specific TCP/IP stack implementation used with the operating system.

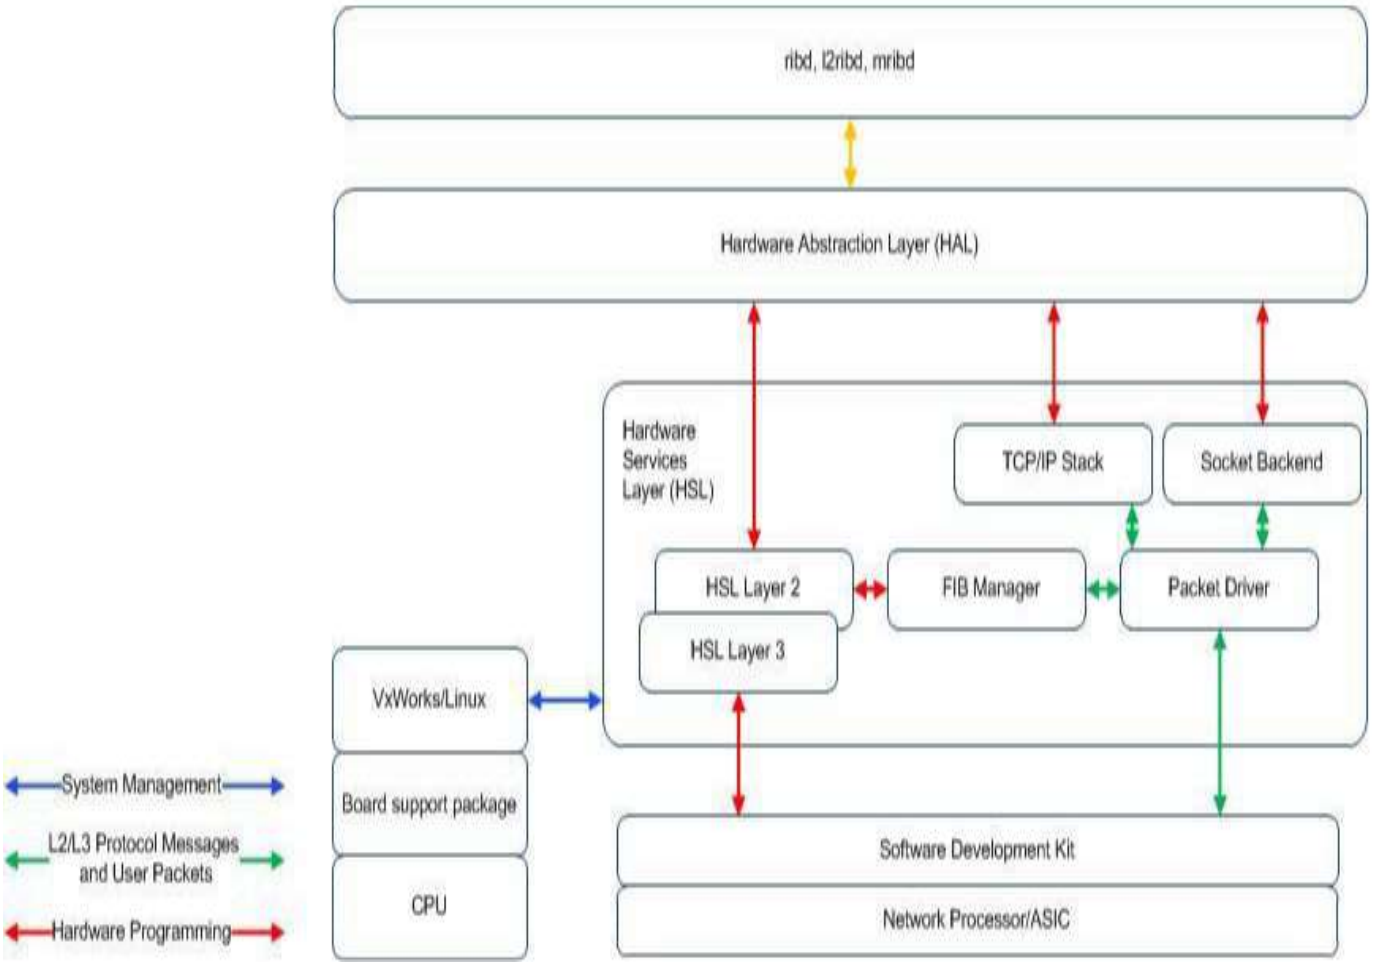

Figure 3-15: HAL and HSL HAL

has two major functions:

- Encapsulating and sending control messages: These messages originate from `ribd`, `l2ribd`, and `mribd`.
- Processing System Responses: HAL processes system responses and events, and calls the appropriate module in the control plane based on the type of event. The processing of system layer responses includes parsing or decoding of the message, and then notifying the appropriate module in the control plane, if required.

To accomplish these tasks, HAL has the following components:

- Socket communication layer
- Hardware Services Layer (HSL)
- Packet driver
- FIB manager
- Ethernet driver

Each component is described in the following sections.

Socket Communication Layer

HAL communicates with the Hardware Services Layer (HSL) through the socket communication layer. In other words, the control plane communicates with the forwarding plane through the socket communication layer. The communication tasks are:

Deliver hardware and operating system configuration messages

- Handle event messages generated by the forwarding plane • Poll forwarding plane information (such as interface information) The communication is based on a client/server model:
- The control plane implements the client side
- The forwarding plane implements the server side

During hardware initialization, the forwarding plane creates a server socket to which control plane clients connect once they start. All communication between the control plane and the forwarding plane is message-based.

SWMRE provides one proprietary `AF_HSL` family socket mechanism which is registered with the operating system.

Each message contains the following:

- Message type
- Message length
- Message data in the TLV encoded (length/field) format

The sender is responsible for preparing the message header and encoding the data. The receiver is responsible for decoding messages, acknowledging receipt of the message to the sender, and performing an integrity check.

Bulk Messaging and Asynchronous Messaging

With bulk messaging, several requests are sent in a single group or a few groups, relieving the burden on the IPC channel and optimizing performance. Bulk messaging is deployed across applications such as NSM, `mstpd`, `ribd`, and `mribd` that have intensive message transactions.

There is a mechanism to bulk information when programming the hardware in the HAL layer. This mechanism can be used by an application layer to bulk information when programming the hardware. However, this feature is not available on x86 platforms, but only for specific silicon vendor hardware.

With asynchronous messaging, the application layer can program the hardware to respond quickly and process the success or failure of a request later. Asynchronous messaging is implemented using message sequencing, a success/ failure callback mechanism, and timers. However, this feature is not available on x86 platforms, but only for specific silicon vendor hardware.

Hardware Services Layer

The Hardware Services Layer (HSL) implements the hardware system-related functions.

Note: Depending of the platform, portions of HSL run in user space or kernel space.

HSL has four main interfaces to the system which are described below:

- Socket Interface to control plane
- SDK interface to hardware
- Operating system Interface
- Event interface

Socket Interface to Control Plane

The socket interface receives control plane messages (such as configuration messages) and sends the response and notification.

SDK Interface to Hardware

The SDK (software development kit) interface configures the hardware chip set (fast path) according to the control plane messages. It is also retrieves counters and statistics.

Operating System Interface

The operating system interface configures the slow path according to control plane messages. The operating system interface also maintains a full forwarding information base (FIB), which is not restricted by hardware limitations.

Event Interface

The event interface registers callbacks with the hardware and the operating system to receive and process system events. Examples of callbacks are:

- Hardware module attachment/detachment
- Link/auto-negotiation status update,
- New address addition/notification from the operating system

HSL processes these events and notifies the control modules and system modules of the change.

For example, to detach an interface, a notification to the control plane is sent to stop all the protocols running on the detached interface. This also notifies the interface manager to delete the detached interface and any associated configuration.

A socket interface receives configuration updates and then sends responses and notifications. Message encapsulation and sending are similar to HAL; however, HSL does not require a response or acknowledgement message. Moreover, HSL acknowledges or sends a response to all messages.

HSL Operating System Functions

HSL uses abstracted operating function calls to provide services for the control plane.These functions are broadly abstracted for the following system services:

- Logging
- Memory allocation
- Synchronization mechanisms (semaphores)
- Thread/process management
- Inter-process communication (IPC)

FIB Manager

Networking devices store forwarding information in two databases:

- RIB (Routing Information Database) which represents a collection of all forwarding possibilities known to a device, learned from different sources, including identical and overlapping entries
- FIB (Forwarding Information Database) which represents an active selection of forwarding entries, used by a device to forward data

Traditionally, there are two paths for traffic forwarding:

- Fast Path where traffic moves via pre-programmed entries on a network processor or ASIC chip

Slow Path forwarding: the network processor or ASIC chip is unable to forward the traffic and data is sent to the CPU/OS before being processed

The FIB manager database contains all forwarding entries, learned dynamically and statically by the system:

- The FIB manager stores and programs forwarding entries selected for forwarding to the network processor or ASIC and operating system.
- The FIB manager removes forwarding entries from the network processor or ASIC and operating system if an entry was withdrawn from the FIB.

As shown in Figure 3-16, the FIB manager database maintains two radix trees:

- A prefix tree that contains all active routes
- A nexthop tree that maintains a tree of attached hosts

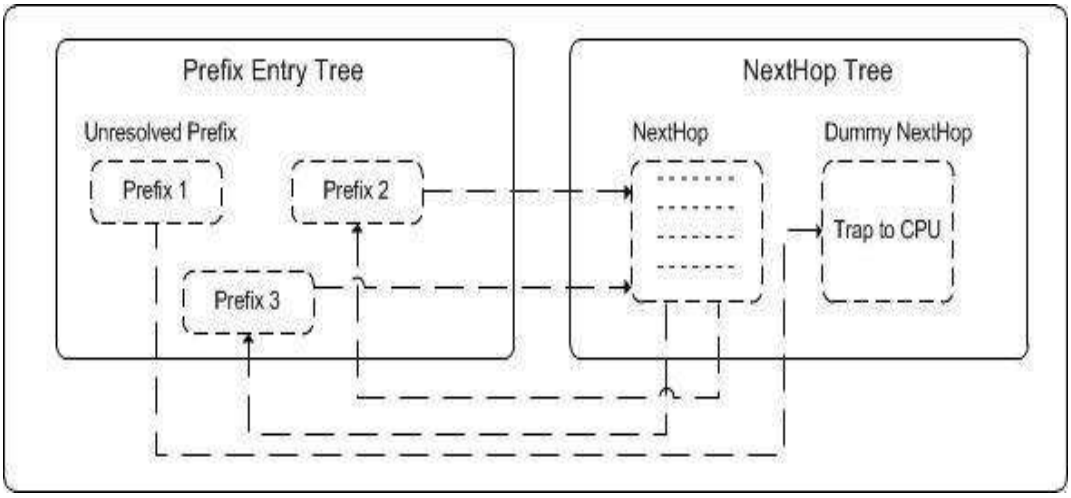

Figure 3-16: FIB manager database

Each prefix with a resolved next-hop points to the next-hop entry in the nexthop tree. Each next-hop points to all prefixes pointing to it. Prefixes with an unresolved next-hop point to a dummy next-hop entry, which indicates to send that traffic to the CPU. Once the CPU receives the traffic, the operating system stack attempts to resolve the next-hop and update the hardware.

The FIB manager performs these major tasks:

- Operating system programing: All prefixes and resolved next-hops are stored in the operating system.
- Hardware programming: Every prefix is installed in the hardware, based on the resolved or dummy nexthop.
- Keeping a shadow of all programmed and un-programmed prefixes.

Every time a new hop is resolved, or an existing nexthop is updated, the nexthop tree is updated, and all prefixes pointing to it are updated with relevant information.

For un-programmed prefix storage:

- The FIB manager stores prefixes and nexthops that cannot be programmed to the hardware due to hardware FIB table size limitations. If the hardware FIB is full, only entries used by traffic are stored; and others are removed.
- The FIB manager monitors prefix usage in hardware to identify and remove unused entries. The FIB Manager uses the ARP aging mechanism to remove unused nexthop entries.
- The FIB Manager handles nested routes to ensure proper forwarding.
- Each time an exception packet is received, the FIB Manager attempts to program a relevant entry to the hardware, making sure that the next time, forwarding occurs through the fast path.

Typically, both the operating system and chip are identically programmed, and only control traffic goes to the CPU. In addition, there is a memory limitation on processors for the number of prefixes a chip can accommodate. Modules keep a

shadow of installed forwarding entries in both the chip and operating system. The FIB manager database has additional fields specific to the hardware, since the processor and ASIC programming require additional information.

Packet Driver

The packet driver module processes packets. Packet receipt occurs in the hardware-interrupt context, when the packet descriptor is passed to the user-callback function. To avoid a packet drop in case of bulk, the packet driver does not immediately start parsing and processing packets. Instead, the packet driver implements a first-in, first out (FIFO) queue for packets to be processed. During hardware interrupt, the packet descriptor is stored in the queue, and the packet-ready semaphore is released. If the queue is full, or the system is not ready for traffic, packets are dropped. Packet processing is based on the hardware CPU error code.

The packet driver is responsible for receiving packets. Packet receipt usually occurs in the hardware-interrupt context. As shown in Figure 3-17, the packet driver implements a first-in, first out (FIFO) queue for packets to be processed.

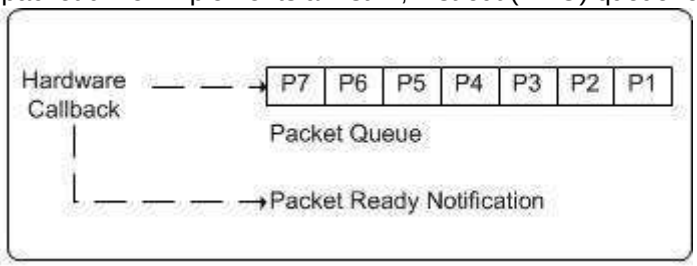

Figure 3-17: Packet driver When

the packet queue is not empty, the packet driver does the following:

1. Gets the packet from the head.
2. Resolves the receiving interface based on the port and the VLAN in the packet.
3. Verifies the packet validity for the interface based on the CPU error code or the packet Ether type.
4. If the packet is a Layer 2 control type (BPDU), it duplicates the packet descriptor, and sends it to a protocol socket.
5. Verifies whether learning is required. If required, it attempts to learn the new neighbor hosts.
6. Verifies if a valid forwarding entry exists. If it exists, the packet driver attempts to program the fast-path FIB.
7. Prepares the packet (CRC/VLAN tag).
8. Uploads the packet to the TCP/IP stack.

Note the following:

- Layer 2 control messages are passed to the protocol modules directly through the sockets.
- Layer 3 data traffic and control messages are passed to the operating system TCP/IP stack.
- Before passing the traffic to the socket or the operating system, the packet driver translates the hardware receive port to the operating system interface, based on the received port and VLAN.
- If the packet is not specific to the interface, the packet driver drops the packet.
- The packet driver removes the VLAN tag if the TCP/IP stack does not support the VLAN interfaces.
- The packet driver removes the packet CRC, if needed.
  The packet driver learns about the neighbor hosts and local FIB updates from the ARP and neighbor solicitation messages.
- The packet driver tries to program the fast path for packets not handled by the hardware.

Ethernet Driver

The Ethernet driver has these functions:

- Handling interfaces in the operating system
- Passing traffic between the hardware and the operating system stack
- Managing network buffer pools

The Ethernet driver registers interfaces in the operating system based on the interface type. Each interface type is represented as a separate device driver. Each device registers a set of driver functions for device handling (start-stop and send-receive). Interfaces of the same type are treated as multiple instances of the device. The Ethernet driver manages the network buffer pool to pass traffic between the hardware SDK and the operating system stack.

The Ethernet driver resolves the destination hardware logical port and modifies packets, if necessary. Possible modifications include VLAN tag insertion and CRC recalculation. Based on the operating system transmitting interface, the Ethernet driver resolves destination hardware ports, updates the packets based on (destination port and VLAN) pair and transmits the packets on the interface.

If the destination interface is the VLAN termination interface including multiple ports, the following logic is applied:

The Ethernet Driver performs a lookup in the Layer 3 FIB:

1. If the destination interface has multiple ports:
    - If the destination port is found in the packet, it is transmitted to that port
    - If the destination port is not found in the packet, the packet is transmitted to all participating ports
2. If the destination interface is an aggregator, the Ethernet driver finds the first participating port where it transmits the packet.

SECTION 2 System Management

System Management Configuration Guide

Contents

This guide contains these chapters:

- Chapter 1, *User Configuration*
- Chapter 2, *Using the Management Interface*
- Chapter 3, *SSH Client Server Host Configuration*
- Chapter 4, *Telnet Configuration*
- Chapter 5, *Syslog Configuration*
- Chapter 6, *DNS Configuration*
- Chapter 7, *DHCP Client Configuration*
- Chapter 8, *Software Monitoring and Reporting*
- Chapter 9, *TACACS Client Configuration*
- Chapter 10, *RADIUS Client Configuration*
- Chapter 11, *DHCP Relay Agent Configuration*
- Chapter 12, *NTP Client Configuration*
- Chapter 13, *Simple Network Management Protocol*
- Chapter 14, *Access Control Lists Configurations*
- Chapter 15, *Show Tech Support Configurations*

CHAPTER 1 User Configuration

Overview

User management is an authentication feature that provides administrators with the ability to identify and control the users who log into the network.

SWMRE provides 4 different roles for users.

- Network Administrator: can make permanent changes to switch configuration. Changes are persistent across reset/reboot of switch.
- Network Engineer: can make permanent changes to switch configuration. Changes are persistent across reset/ reboot of switch.
- Network Operator: can make permanent changes to switch configuration. Changes are not persistent across reset/ reboot of switch.
- Network User: displays information; cannot modify configuration.

User Configuration

`#configure terminal`	Enter configure mode.
`(config)#username user1 password user12345`	Create Username “user1” with password user12345 which will have default role as network-user. Password should be <8-32> char, username <2-15>char.
`(config)#username user1 role networkoperator password user12345`	Changing the role for user1 to network-operator. Password should be <8-32> char, username <2-15>char.
`(config)#username user2 role networkoperator password user12345`	Create a user “user2” with role as network-operator. Password should be <8-32> char, username <2-15>char.
`(config)#username user3 role network-admin password user12345`	Create a user “user3” with role as network-admin. Password should be <8-32> char, username <2-15>char.
`(config)#username user4 role networkengineer password user12345`	Create a user “user4” with role as network-engineer. Password should be <8-32> char, username <2-15>char.
`(config)#exit`	Exit configure mode.

Validation Commands

`show user-account, show user-account <username>, show role`

```
#show user-account
User:user1
                roles: network-operator
User:user2
```

```
                roles: network-operator
User:user3
                roles: network-admin
User:user4
                roles: network-engineer

#show role
Role Name                              Info
```
User Configuration

```
------------------------------------------------------------------------
network-admin                          Network Administrator - Have all
permissions
network-engineer                       Network Engineer - Can save
configuration
network-operator                       Network Operator - Can not save
configuration
network-user                           Network User - Can not change
configuration

#show user-account user1 User:user1
                roles: network-operator
```

CHAPTER 2 Using the Management Interface

Overview

SWMRE provides support for different types of Management Interfaces. The management interface can be the standard out of band (OOB) port, or any in-band port.

To provide segregation between management traffic and data traffic, SWMRE provides a Management VRF. The Management VRF is created by default when SWMRE boots. This VRF cannot be deleted. All ports used as Management Interface needs to be in Management VRF. The management VRF is used for all types of Management applications listed below

- Remote access to router (SSH/Telnet)
- File transfer applications (SFTP/SCP)
- Login Authentication via Radius/Tacacs
- Network management protocols (SNMP, Netconf)

Apart from this, DHCP, DNS, NTP, Syslog, License/Software upgrade also uses ports mapped to management VRF for their operations. Also LLDP protocol can be run on any ports mapped to this Management VRF.

Note: If the management interface flaps, the device becomes unreachable.

Management Port

The Out of Band (OOB) Management Port in SWMRE is identified as “eth0.” This port is automatically mapped to the Management VRF when SWMRE boots, and will remain in same VRF throughout. It cannot be moved out of this VRF.

The IP address of the management port can be configured statically or via DHCP.

Static IP Configuration

A static IP can be configured on the management port during ONIE installation itself, or after installation using the SWMRE CLIs commands. To configure a static IP during ONIE installation, do the following

```
#onie-discovery-stop
#ifconfig eth0 <ip address> netmask <subnet mask> up
```

Please check the *Install Guide* for details.

The IP address configured during ONIE installation will be applied to the management port and the same will be retained when SWMRE boot up, and the port becomes part of Management VRF.

```
#show running-config interface
eth0 ! interface eth0
```

```
 ip vrf forwarding management
ip address 10.12.44.109/24
```

After getting the SWMRE prompt, this IP address can be changed from the CLI.

Using the Management Interface

`#configure terminal`	Enter Configure mode.
`(config)#interface eth0`	Change mode to interface eth0
`(config-if)# ip address 10.12.44.120/24`	Set a ipv4 address on this interface
`(config-if)#exit`	Exit from the interface mode
`(config)#exit`	Exit from the configuration mode.

If a static IP is not configured during ONIE installation the same can be configured via CLI by following the above steps. Using the SWMRE CLI, DHCP can also be enabled on the Management port.

`#configure terminal`	Enter Configure mode.
`(config)#interface eth0`	Change mode to interface eth0
`(config-if)# ip address dhcp`	Enable DHCP on interface eth0
`(config-if)#exit`	Exit from the interface mode
`(config)#exit`	Exit from the configuration mode.

Obtaining IP Address via DHCP

During onie installation, the management port attempts to acquire IP address via DHCP automatically unless stopped explicitly using “onie-discovery-stop”. So, if management port is getting IP via DHCP, after SWMRE boots, the management port will continue to use DHCP, even when it’s part of the Management VRF.

```
#show running-config interface eth0Zeb
!   interface
eth0
 ip vrf forwarding management
ip address dhcp
```

After SWMRE comes up, the IP address can be changed to any static IP via CLI as shown earlier.

In-Band Ports

Any front-end ports of the device (In-Band ports) can be made part of the management VRF. Once they are part of the management VRF they can also support all management applications such as SSH/Telnet and others as listed in Overview.

Once the ports are part of the management VRF, they should not be used for data traffic and routing or switching purposes. In-Band ports can be added or removed from Management VRF as and when required.

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1/1`	Change mode to interface xe1/1

(config-if)# ip vrf forwarding management	Add In-Band port as part of Management VRF
(config-if)#exit	Exit from the interface mode
(config)#exit	Exit from the configuration mode.

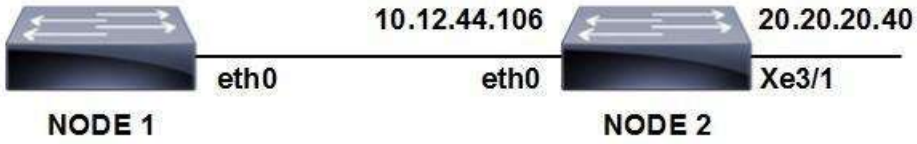
Using the Management Interface

#configure terminal	Enter Configure mode.
(config)#interface xe1/1	Change mode to interface xe1/1
(config-if)# no ip vrf forwarding management	Remove In-Band port from Management VRF
(config-if)#exit	Exit from the interface mode
(config)#exit	Exit from the configuration mode.

Using Ping in Management VRF

To check reachability to any node in the management network, you need to explicitly mention the VRF name as “management.”

In the following example, Node-1 has management interface eth0 and Node-2 has management interfaces eth0 and xe3/1. In order to reach the network 20.20.20.40/24 from Node-1 a static route needs to added.



#configure terminal	Enter Configure mode.
(config)# ip route vrf management 20.20.20.0/24 10.12.44.106 eth0	Add static route in management VRF to reach 20.20.20.0/24 network
(config)#exit	Exit from the configuration mode.

```
Node-1#show ip route vrf management
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS
area,        inter v - vrf leaked * - candidate default

IP Route Table for VRF "management"
C       10.12.44.0/24 is directly connected, eth0
S20.20.20.0/24 [1/0] via 10.12.44.106, eth0

Gateway of last resort is not set

Node-1#ping 20.20.20.40 vrf management
PING 20.20.20.40 (20.20.20.40) 56(84) bytes of data.
```

```
64 bytes from 20.20.20.40: icmp_seq=1 ttl=64 time=0.494 ms
64 bytes from 20.20.20.40: icmp_seq=2 ttl=64 time=0.476 ms
```

CHAPTER 3 SSH Client Server Host Configuration

Overview

SSH is a network protocol that allows data to be exchanged using a secure channel between two networked devices.SSH was designed as a replacement for Telnet and other insecure remote shells, which send information, notably passwords, in plain text, rendering them susceptible to packet analysis.[2] The encryption used by SSH is intended to provide confidentiality and integrity of data over an unsecured network, such as the Internet.SSH uses public-key cryptography to authenticate the remote computer and allow the remote computer to authenticate the user.

SSH is typically used to log into a remote machine and execute commands, but it also supports tunneling, forwarding TCP ports and X11 connections; it can transfer files using the associated SFTP or SCP protocols. SSH uses the client- server model

The standard TCP port 22 has been assigned for contacting SSH servers. Here in this document covering the ssh server configuration to enable ssh service and key generation CLI commands and ssh client configuration for remote login to server.

Topology

Figure 3-22: SSH sample topology

`#configure terminal`	Enter Configure mode.
`(config)#no feature ssh vrf management`	Disable the feature ssh.
`(config)# ssh login-attempts 2 vrf management`	Set Login-attempts 2. Default is 3.
`(config)#feature ssh vrf management`	Enable the feature ssh.
`(config)#exit`	Exit from the configuration mode.

The login-attempt is set to 2 which means that the five times the password can be re-entered. The feature ssh should be disabled while configuring the login-attempts and it should be enabled before creating the SSH session.

Validation Commands

`show ssh server, show running-config ssh server`

```
#sh ssh server
```

```
ssh server enabled port: 22
authentication-retries 2

#sh running-config ssh server
feature ssh
```

SSH Client Server Host Configuration

Support for In-band Management over default VRF

SWMRE offers support for SSH over default and management VRFs via in-band management interface & OOB management interface, respectively.

The feature can be enabled to run on default and management VRF simultaneously. By default, it runs on the management VRF.

SSH Keys

`#configure terminal`	Enter Configure mode.
`(config)#no feature ssh [vrf management]`	Disable the feature ssh.
`(config)# ssh login-attempts 2 [vrf management]`	Set Login-attempts 2. Default is 3.
`(config)#feature ssh [vrf management]`	Enable the feature ssh.
`(config)#exit`	Exit from the configuration mode.

Use this SSH keys to generates new RSA/DSA keys for SSH server. This command can only be executed when the SSH server is disabled. By default the system has RSA/DSA public/private key pair placed in /etc/ssh/. If the user wants to regenerate the keys the force option must be specified. The length option can only be used with RSA keys; DSA has a constant key length of 1024bits.

`#configure terminal`	Enter Configure mode.
`(config)#no feature ssh vrf management`	Disable the feature ssh.
`(config)# ssh key rsa force vrf management`	The force option is used if the user wants to regenerate the ssh rsa keys. The same thing applies for dsa also.
`(config)#feature ssh vrf management`	Enable the feature ssh.
`(config)#exit`	Exit from the configuration mode.

Validation Commands

`show ssh key`

```
#sh ssh key
****************RSA KEY********************

************************************
```

Note: The newly created rsa/dsa key can be verified by logging into DUT from remote machine and checking whether the newly created key's fingerprint matches with the logging session fingerprint.

SSH Client session

When the device is acting as an SSH client, it supports both SSH ipv4 sessions to login to remote machine.

SSH Client

`#ssh root@10.10.10.1 vrf management`	Logging into remote machine using ipv4 address.

SSH Encryption Cipher

Use this SSH cipher to set which cipher is to be used to encrypt an ssh session. By default, all the ciphers are supported for a new ssh client to connect to the ssh server.

SSH server supports the encryption algorithms Advanced Encryption Standard Counter Mode [AES-CTR], Advanced Encryption Standard Cipher Block Chaining [AES-CBC], and Triple Data Encryption Standard [3DES].

The following is a list of standards:

1. aes128-ctr
2. aes192-ctr
3. aes256-ctr
4. aes128-cbc

5. 3des-cbc
6. aes192-cbc
7. aes256-cbc

Configuring an Encryption Cipher

`#configure terminal`	Enter Configuration Mode.
`(config)#ssh server algorithm encryption aes128-ctr`	Set ssh server cipher encryption algorithm to AES 128 bit Counter Mode.

SSH Client Server Host Configuration

`(config)# ssh server algorithm encryption aes128-cbc`	Set ssh server cipher encryption algorithm to AES 128 Cipher block chaining.
`(config)#exit`	Exit from the configuration mode.

Validation

The newly configured cipher encryption algorithm will take effect for a new incoming ssh client connection.

```
#show running-config ssh server
```

SSH Client Session

`#ssh cipher aes128-ctr root@1.1.1.1`	AES 128-bit Counter Mode to establish ssh connection to a remote machine using ipv4 address.

CHAPTER 4 Telnet Configuration

Overview

Telnet is a TCP/IP protocol used on the Internet and local area networks to provide a bidirectional interactive text-oriented communications facility using a virtual terminal connection. The Telnet program runs, connects it to a server on the network. A user can then enter commands through the Telnet program and they will be executed as if the user were entering them directly on the server console.Telnet enables users to control the server and communicate with other servers on the network. The default port number for Telnet protocol is 23.Telnet offers users the capability of running programs remotely and facilitates remote administration.

Support for In-band Management Over Default VRF

SWMRE offers support for Telnet over default and management VRFs via in-band management interface & OOB management interface, respectively.

The feature can be enabled to run on default and management VRFs simultaneously. By default, it runs on management VRF.

Topology

Figure 4-23: Telnet sample topology

Enable and Disable the Telnet Server

`#configure terminal`	Enter Configure mode.
`(config)#no feature telnet vrf management`	Disable Telnet feature.
`(config)#feature telnet vrf management`	Enable Telnet feature.
`(config)#exit`	Exit configure mode.

Configure the Telnet Server Port

`#configure terminal`	Enter Configure mode.

(config)#no feature telnet vrf management	Disable Telnet feature.
(config)#telnet server port 6112 vrf management	Set Telnet port to 61112. Default is 23.

Telnet Configuration

(config)#feature telnet vrf management	Enable Telnet feature.
(config)#exit	Exit configure mode.

Telnet Client session

#telnet root@10.10.10.1 vrf management	Logging into remote machine using ipv4 address.

Validation Commands

```
#show telnet server telnet server enabled port: 6112

#show running-config telnet server feature telnet
```

CHAPTER 5 Syslog Configuration

Syslog is a standard for logging program messages. It allows separation of the software that generates messages from the system that stores them and the software that reports and analyzes them. It also provides devices which would otherwise be unable to communicate, a means to notify administrators of problems or performance.

SWMRE supports logging messages to a syslog server in addition to logging to a file or the console (local or ssh/telnet console). SWMRE messages can be logged to a local syslog server (the machine on which SWMRE executes) as well as to one or more remote syslog servers. Remote syslog servers can either be configured with IPv4 addresses or host names.

Support for In-band management over default VRF

SWMRE now offers support for Syslog over default and management VRFs via in-band management interface & OOB management interface, respectively.

The feature can either be running on the default or management VRFs. By default, it runs on the management VRF using a new CLI feature `rsyslog` [vrf management].

Topology

Figure 5-24: Syslog sample topology

Enabling rsyslog

`#configure terminal`	Enter Configure mode.
`config)#feature rsyslog [vrf management]`	Enable feature on default or management VRF. By default this feature runs on management VRF.
`config)#exit`	Exit from the configuration mode

Logging to a File

The below configurations shows how to enable debug logs for a particular protocol. In this case, LACP is shown.

`#debug lacp all`	This enables the debugging on LACP.
`#configure terminal`	Enter Configure mode.
`(config)#logging level lacp 7 [vrf management]`	This enable debug messages for LACP module. This is configurable either if default of management VRF.

(config)#logging logfile xyz 7	This creates the log file where the logs will be saved. The path of the file will be in the directory /log/xyz. Log File size 40964194304 bytes.

Syslog Configuration

(config)#interface xe1	Enter interface mode.
(config-if)#switchport	Make port as switchport.
(config-if)#channel-group 1 mode active	Make port as part of port-channel 1.
(config-if)#exit	Exit interface mode.
(config)#exit	Exit configure mode.

To verify this, do some lacp configuration and view the messages in the log file or with the show logging logfile command.

Validation Commands

show logging logfile, show logging level

```
    #show logging logfile
    File logging : enabled File Name : /log/xyz Severity : (7)
    2016 Mar 03 00:02:32 x86_64-debian NSM-3: AgentX: failed to send open message:

```

Logging to the Console

`#configure terminal`	Enter Configure mode.
`(config)#logging level ospf 7`	This enable debug messages for OSFP module.
`(config)#logging console 7`	This enables the console logs.
`(config)#debug ospf`	This enables the debugging on OSPF configurations.
`(config)#router ospf`	Enabling ospf for process 1.
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit configure mode.

To verify this, do some OSPF configuration and view the messages in the console.

Validation Commands

```
#show logging console
    Console logging      : enabled Severity: (debugging)

#show logging level

    Facility         Default Severity        Current Session
    Severity nsm                     3                          3
    ripd                    3                        3 ospfd
    3                          7 ospf6d                  3

    2 rsvpd                  2                         2 mribd
    2                          2 pimd                    2
    2 authd                  2                         2 mstpd
    2                          2 imi                     2
    2 onmd                   2                         2 oamd
    2                          2 vlogd                   2
    2 vrrpd                  2                         2 ribd
    2                          2 bgpd                    3
    3 l2mribd                2                         2 lagd
    2                          2 sflow                   2
    2 pservd                 2                         2
```

Logging to Remote Server

#configure terminal	Enter Configure mode.
(config)#logging level bgp 7	This enable debug messages for BGP module.
(config)#logging server 10.16.2.1 vrf management	Redirects the log messages to the server configured.
(config)#debug bgp	This enables the debugging on BGP configurations.
(config)#router bgp 1	Enabling BGP process 1.
(config-router)#exit	Exit router mode.
(config)#exit	Exit configure mode.

Validation Commands

```
#show logging server
      Remote Servers:
                  10.16.2.1                  severity:
    (debugging)                facility: local7
    VRF: management

    #show logging level

    Facility        Default Severity        Current Session Severity nsm
    3                           3 ripd                    3
    3 ospfd                   3                           3 ospf6d
    3                           3 isisd                   3
    3 hostpd                  3                           3 ldpd
    2                           2 rsvpd                   2
    2 mribd                   2                           2 pimd

CHAPTER 6 DNS Configuration

Overview

The Domain Name System (DNS) is an Internet service that translates domain names into IP addresses. When a domain name is used, DNS service translates the name into the corresponding IP address. If one DNS server does not know how to translate a particular domain name, it gathers information from other Domain Name Systems to obtain the correct IP address.

Support for In-band Management over default VRF

SWMRE offers support for DNS over default and management VRFs via in-band management interface & OOB management interface, respectively.

The feature can be enabled to run on default and management VRF simultaneously. By default, it runs on management VRF.

Topology

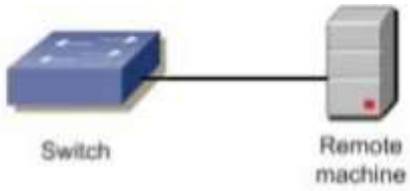

Figure 6-25: DNS sample topology

Configuration

`#configure terminal`	Enter Configure mode.
`(config)#ip name-server vrf management 10.12.17.11  10.1.1.2`	This add a IPv4 Name Server to the DNS.
`(config)#ip host BINGO vrf management 10.1.1.1`	This will add IPv4 host to the DNS
`(config)#exit`	Exit configure mode.

Validation Commands

```
#show hosts
             VRF: default

     DNS lookup is disabled
     Default domain is empty
     DNS domain list is empty

     Name Servers        : 10.12.17.11 10.1.1.2
```

```
Host                                                    Address
----                                                    ------BINGO
10.1.1.1

 * - Values assigned by DHCP Client.
```

CHAPTER 7 DHCP Client Configuration

Overview

Dynamic Host Configuration Protocol (DHCP) protocol is used for assigning dynamic IP addresses to systems on a network. Dynamic addressing allows a system to have an IP address each time it connects to the network. DHCP makes network administration easier by removing the need to manually assign a unique IP address every time a new system is added to the network. It is especially useful to manage mobile users. Once a system is configured to use DHCP, it can be automatically configured on any network that has a DHCP server.

DHCP uses a client-server model, in which the DHCP server centrally manages the IP addresses used in the network. DHCP clients obtain an IP address on lease from the DHCP server.

DHCP Client Configuration for IPv4

Before configuring the DHCP in client, make sure that DHCP server is ready and also dhcpd is running on the server machine.

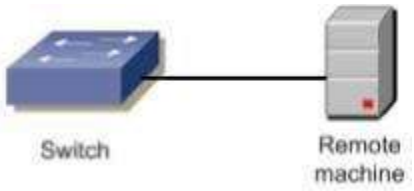

Figure 7-26: DHCP sample topology

`#configure terminal`	Enter Configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This will be enabled by default.
`(config)#interface xe1`	Specify the interface(xe1) to be configured and enter the interface mode.
`(config-if)#ip address dhcp`	The client requests for the IP address to the server, once it receives the acknowledgment from the server, it assigns the IP address to the interface in which this command is enabled.
`(config if)#exit`	Exit interface mode.
`(config)#interface eth0`	Enter management interface mode.
`(config-if)#ip address dhcp`	The client requests for the IP address to the server, once it receives the Acknowledgement from the server, it assigns the IP address to the management interface.
`(config if)#exit`	Exit interface mode.

Validation Commands

```
#show running-config dhcp
    interface  xe2    ip
    address dhcp
    ! ip dhcp relay
    information option
```

DHCP Client Configuration

```
    #sh ip interface brief

    Interface            IP-Address      Admin-Status          Link-Status
    GMPLS Type
    eth0                  10.12.44.20     up                    up
    -
    lo                    127.0.0.1       up                    up
    -
    lo.4                  127.0.0.1       up                    up
    -
    vlan1.1               unassigned      up                    down
    -
    xe1/1                 2.2.2.3         up                    up
    -
    xe1/2                 unassigned      down                  down
    -
    xe1/3                 unassigned      down                  down
    -
    xe1/4                 unassigned      up                    down
    -
    xe2                  *40.40.40.40     up                    down
    -
    xe3/1                 20.20.30.1      up                    up
    -
```

CHAPTER 8 Software Monitoring and Reporting

Overview

SWMRE provides a mechanism (called “watchdogging”) to monitor all SWMRE modules and provides the following functions.

1. Periodic heart beat check.
2. Automatic restarts of a module upon a hung state or crash detection.
3. Upon hanging or crashing of a module, a crash report (including system states) is logged.
4. A proprietary SNMP trap is sent to the trap manager, if configured, after a fault is detected in a protocol module. Similarly a trap is sent when the module recovers.

By default, the software watchdog is enabled and the keep-alive time interval is 30 seconds. All SWMRE processes periodically send keep-alive messages to a monitoring module at the configured keep-alive time interval.

This functionality can be disabled for a particular module or all SWMRE modules by using CLI commands. In order to permanently disable software monitoring functionality, the user has to disable the watchdog feature. If, however, software watchdogging is disabled the monitoring module doesn’t take any action upon a hang or crash of any SWMRE module.

Software Monitoring

`#configure terminal`	Enter Configure mode.
`(config)#feature software-watchdog`	Enable software watchdog for all SWMRE modules — This is the default.
`(config)#no software-watchdog imi`	To disable software watchdog for only imi modules.
`(config)#software-watchdog keep-alive-time 100`	The keep-alive time interval in seconds. Default is 60 seconds and applies to all SWMRE modules.
`#show software-watchdog status`	Display the keep-alive time interval and list of SWMRE process names with watchdog status for each SWMRE modules.

Validation

```
#show software-watchdog status
Software Watchdog timeout in seconds : 100
Process name         Watchdog
status ============
=============== nsm
```

```

CHAPTER 9 TACACS Client Configuration

Overview

Terminal Access Controller Access Control System (TACACS) is a remote authentication protocol that is used to communicate with an authentication server. With TACACS, a network device communicates to an authentication server to determine whether a particular user should be allowed access to the device. TACACS+ listens at port 49.

TACACS Server Authentication

Figure 9-27: TACACS Server Host Configuration

Authenticating Device

`#configure terminal`	Enter Configure mode.
`(config)#feature tacacs+ vrf management`	Enable the feature TACACS+ for management vrf
`(config)#feature tacacs+ vrf`	Enable the feature TACACS+. for default vrf
`(config)#tacacs-server login key testing101 vrf management`	Specify the global key for tacacs servers that are not configured with their respective keys for management vrf This key should match the one present in the config file of tacacs server
`(config)#tacacs-server login key testing101`	Specify the global key for tacacs servers that are not configured with their respective keys for default vrf This key should match the one present in the config file of tacacs server
`(config)#tacacs-server host 10.16.19.2 vrf management key testing123`	Specify the tacacs server ipv4 address to be configured with shared key. The same key should be present on the server config file
`(config)#tacacs-server login host 10.16.19.2 key testing123`	Specify the tacacs server ipv4 address to be configured with shared local key for default vrf The same key should be present on the server config file.
`(config)#tacacs-server host 10.12.30.135 vrf management seq-num 1 key testing123`	Specify the tacacs server ipv4 address to be configured with the sequence number and the shared key. The key should match the one present in the server config file
`(config)#tacacs-server host 10.12.30.86 vrf management seq-num 2 port 1045`	Specify the tacacs server ipv4 address to be configured with the sequence and port number.The tacacs server should be started with same port number
`config)#tacacs-server login host 10.12.30.86 seq-num 2 port 1045`	Specify the tacacs server ipv4 address to be configured with the sequence and port number for default vrf. The tacacs server should be started with same port number

(config)#tacacs-server login host 10.12.17.11 vrf management seq-num 8 key 7 65535 port 65535	Specify the tacacs server ipv4 address to be configured with the sequence, key and port number for management vrf. The tacacs server should be started with same port number.
(config)#tacacs-server login host 10.12.17.11 seq-num 8 key 7 65535 port 65535	Specify the tacacs server ipv4 address to be configured with the sequence, key and port number for default vrf. The tacacs server should be started with same port number.
(config)#tacacs-server login host Tacacs-Server-1 vrf management seq-num 7 key 7 65535 port 65535	Specify the tacacs server configured with host-name sequence number key and port number for management vrf. The tacacs server should be started with same port number
(config)#tacacs-server login host Tacacs-Server-1 seq-num 7 key 7 65535 port 65535	Specify the tacacs server configured with host-name sequence number key and port number for default vrf. The tacacs server should be started with same port number
(config)#aaa authentication login default vrf management group tacacs+	Enable authentication for TACACS+ server configured for management vrf. Authorization is also enabled by default
(config)#aaa authentication login default group tacacs+	Enable authentication for TACACS+ server configured for default vrf. Authorization is also enabled by default.
(config)#aaa authentication login default vrf management group tacacs+ local	Enable authentication for TACACS+ and fall-back to local configured for management vrf. Authorization is also enabled by default
(config)#aaa authentication login default vrf management group tacacs+ local none	Enable authentication for TACACS+ fall-back to local followed by fall-back to none configured for management vrf. Authorization is also enabled by default
(config)#aaa authentication login default vrf management group tacacs+ none	Enable authentication for TACACS+ fall-back to none configured for management vrf. Authorization is also enabled by default
(config)#aaa authentication login default group tacacs+ none	Enable authentication for TACACS+ fall-back to none , configured for default vrf. Authorization is also enabled by default
(config)#aaa group server tacacs+ G1 vrf management	Create aaa group G1 for management vrf
(config)#aaa group server tacacs+ G1	Create aaa group G1 for default vrf
(config-tacacs)#server 10.12.30.86 vrf management	Make the tacacs-server 10.12.30.86 a part of this group G1
(config-tacacs)#server 10.12.30.86	Make the tacacs-server 10.12.30.86 a part of this group G1 for default vrf
(config-tacacs)#server Tacacs-Server-1 vrf management	Make the tacacs-server Tacacs-Server-1 a part of this group G1 for management vrf
(config-tacacs)#server Tacacs-Server-1	Make the tacacs-server Tacacs-Server-1 a part of this group G1 for default vrf
(config)#exit	Exit the tacacs-config
(config)#aaa authentication login default vrf management group G1	Authenticate the tacacs+ group G1 with aaa authentication for management vrf
(config)#aaa authentication login default group G1	Authenticate the tacacs+ group G1 with aaa authentication for default vrf

Users are mapped as shown as shown in Table 9-2 :

Table 9-2: Role/privilege level mapping

Role	Privilege level
Network administrator	15
Network engineer	14
Network operator	1 to 13
Network user	0 or any other values (>15 or negative values or any character)

TACACS Server Accounting

After authentication, the user can configure accounting to measure the resources that the user consumes during access.

Authenticating Device

#configure terminal	Enter Configure mode.
(config)#feature tacacs+ vrf management	Enable the feature TACACS+ for vrf management
(config)#feature tacacs+	Enable the feature TACACS+ for default vrf
(config)#tacacs-server host 10.16.19.2 vrf management key testing123	Specify the TACACS server IPv4 address to be configured with shared key for vrf management. The same key should be present in the server configuration file.
(config)#tacacs-server login host 10.16.19.2 key testing123	Specify the TACACS server IPv4 address to be configured with shared key default vrf. The same key should be present in the server configuration file.
(config)#aaa accounting default vrf management group tacacs+	Enable accounting for TACACS server configured for vrf management.
(config)#aaa accounting default group tacacs+	Enable accounting for TACACS server configured for default vrf
#clear tacacs-server counters vrf management	Clear tacacs server counters for management vrf
#clear tacacs-server counters vrf all	Clear tacacs server counters for management and default vrf
#clear tacacs-server counters	Clear tacacs server counters for default vrf

To verify the TACACS accounting process, connect using SSH or Telnet from the host to the client with the user created and provided TACACS server password, and check whether the client validates the user with corresponding username and password.

Validation Commands

show tacacs-server, show aaa accounting, show aaa accounting

```
#show aaa accounting vrf management
                    VRF: management       default: group tacacs+
#

#show aaa accounting vrf all
                    VRF: management       default: group tacacs+

                    VRF: default       default: group tacacs+

#show aaa accounting
                    VRF: default       default: group tacacs+
          #
```

```
    #show running-config aaa aaa authentication login default vrf management group G1
 aaa accounting default vrf management group tacacs+ aaa group server tacacs+ G1 vrf
    management server Tacacs-Server-1 vrf management server 10.12.17.11 vrf
    management

    aaa authentication login default group tacacs+ aaa accounting default
    group tacacs+ aaa group server tacacs+ G1 server Tacacs-Server-1
    server 100.0.0.1
```

Sample TACACS Config File Contents

```
#tacacs configuration file #set the key

    key = "testing123"
    accounting file = /var/log/tac_acc.log

    user = test1 {
            default service = permit         login = cleartext
    "12345"
    }

    group = netadmin {
            service = ppp protocol = ip {          priv-lvl = 1
            } }

    user = test2 {
            default service = permit         login = cleartext
    "12345"         member = netadmin
    }

    user = test3 {
            default service = permit
    login = cleartext "12345"
    service = ppp protocol = ip {
    priv-lvl = 15
    }
    }
```

TACACS Server Authorization

Authorization is realized by mapping the authenticated users to one of the existing predefined roles as shown in Table 9-2.

The privilege information from the TACACS+ server is retrieved for the authenticated users and is mapped onto one of the roles as shown in Table 9-2.

Each authenticated user is mapped to one of the pre-defined privilege level.

Users with priv-level <=0 and priv-level > 15 are treated as read-only user mapped onto the pre-defined network-user role.

There is no command to enable authorization. Authorization functionality is enabled by default when remote authentication is enabled with TACACS+.

Authorization is “auto-enabled”. After successful authentication, a user can enter into privilege exec mode, irrespective of its privilege level and such user is not prompted with enable mode password, if configured. However based on their role, commands are rejected if not allowed to perform certain operations.

Example

A network-user has read-only access and can only execute show commands. A network-user cannot enter configuration mode. An error message is displayed upon executing any command which is not allowed.

```
#write
% Access restricted for user %
```

```
#configure terminal
% Access restricted for user %
```

The following attribute value pair in TACACS+ server is used to fetch user privilege information.

```
service = ppp protocol = ip {          priv-lvl = <0…15>
}
```

Sample TACACS+ Configuration File

```
#tacacs configuration file from “tac_plus version F4.0.3.alpha
” #set the key

key = "testing123"
accounting file = /var/log/tac_acc.log

#Read only user “test1”, without any priv-lvl, mapped to role “network-user”
user = test1 { default service =
permit login = cleartext "12345"
}

#We can create a group of users mapped to a privilege group
= netadmin { service = ppp protocol = ip { priv-lvl = 15
} }

#User “test2” with highest priv-lvl=15, mapped to role “network-admin” user =
test2 { default service = permit login = cleartext "12345" member = netadmin }

#User “test3” with priv-lvl= 1…13, mapped to role “network-operator” user
= test3 { default service = permit login = cleartext "12345" service = ppp
protocol = ip { priv-lvl = 10
} }
#User “test4” with priv-lvl=14, mapped to role “network-engineer” user = test4 {
default service = permit login = cleartext "12345" service = ppp protocol = ip { priv-
lvl = 14 } }
```

CHAPTER 10 RADIUS Client Configuration

Overview

Remote Authentication Dial In User Service (RADIUS) is a remote authentication protocol that is used to communicate with an authentication server.

A RADIUS server is responsible for receiving user connection requests, authenticating the user, and then returning all configuration information necessary for the client to deliver service to the user.

The key points for RADIUS authentication are:

- Transactions between client and server are authenticated through the use of a shared key and this key is never sent over the network.
- The password is encrypted before sending it over the network.

RADIUS Server Authentication

Figure 10-28: RADIUS Server Host Configuration

Host

`#configure terminal`	Enter configure mode.
`(config)# radius-server login key testing101 vrf management`	Specify the global key for radius servers that are not configured with their respective keys for management vrf. This key should match the one present in the config file of tacacs server.
`(config)# radius-server login key testing101`	Specify the global key for radius servers that are not configured with their respective keys for default vrf. This key should match the one present in the config file of tacacs server
`(config)# radius-server login host 10.16.19.2 vrf management key testing123`	Specify the radius server ipv4 address to be configured with shared local key for management vrf. The same key should be present on the server config file.
`(config)# radius-server login host 10.16.19.2 key testing123`	Specify the radius server ipv4 address to be configured with shared local key for default vrf. The same key should be present on the server config file.

(config)# radius-server login host 10.12.30.86 vrf management auth-port 1045	Specify the radius server ipv4 address to be configured with port number for management vrf. The radius server should be started with same port number.

(config)# radius-server login host 10.12.30.86 auth-port 1045	Specify the radius server ipv4 address to be configured with port number for default vrf.The radius server should be started with same port number
(config)#radius-server login host 10.12.17.11 vrf management key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 6	Specify the radius server ipv4 address to be configured with authentication port number, accounting port number, shared key for management vrf. The radius server should be started with same port number.
(config)#radius-server login host 10.12.17.11 key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 6	Specify the radius server ipv4 address to be configured with authentication port number, accounting port number, shared key for default vrf. The radius server should be started with same port number. The radius server should be started with same port number
(config)# radius-server login host Tacacs-Server-1 vrf management seq-num 7 key 7 65535 port 65535	Specify the radius server configured with hostname, key authentication port number, accounting port number, for management vrf. The radius server should be started with same port number
(config)# radius-server login host Radius-Server-1 seq-num 7 key 7 65535 port 65535	Specify the radius server configured with hostname sequence number, key and port number for default vrf. The radius server should be started with same port number.
(config)#aaa authentication login default vrf management group radius	Enable authentication for radius server configured for management vrf. Authorization is also enabled by default
(config)#aaa authentication login default group radius	Enable authentication for radius server configured for default vrf. Authorization is also enabled by default.
(config)#aaa authentication login default vrf management group radius local	Enable authentication for radius server and fallback to local configured for management vrf. Authorization is also enabled by default
(config)#aaa authentication login default group radius local	Enable authentication for radius server and fallback to local configured for default vrf. Authorization is also enabled by default
(config)#aaa authentication login default vrf management group radius local none	Enable authentication for radius server, fallback to local followed by fallback to none ,configured for management vrf. Authorization is also enabled by default
(config)#aaa authentication login default radius local none	Enable authentication for radius server, fallback to local followed by fallback to none, configured for default vrf. Authorization is also enabled by default
(config)#aaa authentication login default vrf management group radius none	Enable authentication for radius, fallback to none, configured for management vrf. Authorization is also enabled by default
(config)#aaa authentication login default group radius none	Enable authentication for radius, fallback to none, configured for default vrf. Authorization is also enabled by default
(config)#aaa group server radius G1 vrf management	Create aaa radius group G1 for management vrf
(config)#aaa group server radius G1	Create aaa radius group G1 for default vrf
(config-radius) #server 10.12.30.86 vrf management	Make the radius-server 10.12.30.86 a part of this group G1 for management vrf

(config-radius)#server 10.12.30.86	Make the radius server 10.12.30.86 a part of this group G1 for default vrf
(config-radius)#server Radius-Server-1 vrf management	Make Radius-Server-1 a part of this group G1 for management vrf
(config-radius)#server Tacacs-Server-1	Make the radius server Radius-Server-1 a part of this group G1 for default vrf
(config)#aaa authentication login default vrf management group radius tacacs+	Enable authentication for radius, fallback to tacacs+, configured for management vrf. Authorization is also enabled by default
(config)#aaa authentication login default group radius tacacs+	Enable authentication for radius, fallback to tacacs+, , configured for default vrf. Authorization is also enabled by default
(config)#aaa authentication login default vrf management group tacacs+ radius	Enable authentication for tacacs+ fallback to radius configured for management vrf. Authorization is also enabled by default
(config)#aaa authentication login default group tacacs+ radius	Enable authentication for tacacs+ fallback to radius configured for default vrf. Authorization is also enabled by default
(config)#username test password test12345	Create username and password for authentication purpose. The same user should be present in the radius server config file.

Validation

To verify the RADIUS authentication process, use SSH or Telnet from the host machine to Host IP with the authenticating user created, and provide a RADIUS server password and check whether the client validates the user with the corresponding username and password.

```
#sh radius-server vrf management
VRF: management         timeout
value: 5

        Total number of servers:2

         Following RADIUS servers are configured:

RADIUS Server Accounting

You can configure accounting to measure the resources that another user consumes during access.

User

`#configure terminal`	Enter Configure mode.
`(config)#radius-server login host 10.12.17.11 vrf management key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 6`	Specify the radius server ipv4 address to be configured with authentication port number, accounting port number, shared key for management vrf. The radius server should be started with same port number.
`(config)#radius-server login host 10.12.17.11 key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 6`	Specify the radius server ipv4 address to be configured with port number for default vrf.The radius server should be started with same port number
`(config)#aaa accounting default vrf management group radius`	Enable accounting for radius server configured for vrf management
`(config)#aaa accounting default group radius`	Enable accounting for radius server configured for default vrf
`(config)#username test password test12345`	Create username and password for accounting purpose.The same user should be present in the radius server config file.

Validation

```
#sh aaa accounting vrf management
VRF: management   default: group radius
```

```
#sh aaa accounting vrf all
VRF: management   default: group radius

                VRF:  default     default:  group
radius

#sh aaa accounting                 VRF:
default   default: group radius
#
#sh running-config aaa
aaa authentication login default vrf management group radius aaa
accounting default vrf management group radius aaa group server radius
rad1 vrf management     server Radius-Server-1 vrf management     server

```

CHAPTER 11 DHCP Relay Agent Configuration

Overview

The DHCP Relay feature was designed to forward DHCP broadcast requests as unicast packets to a configured DHCP server or servers for redundancy.

DHCP Relay for IPv4

Before configuring DHCP Relay, make sure DHCP server and client configurations are done.

Figure 11-29: DHCP Relay Configuration

DHCP Agent

`#configure terminal`	Enter Configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This is enabled by default.
`(config)#ip dhcp relay`	By default this will be enabled. It starts the ip dhcp relay service.
`(config)#interface xe1`	Specify the interface(xe1) to be configured and enter the interface mode.
`(config-if)#ip address 10.10.10.1/24`	Configure ipv4 address on the interface xe1.
`(config if)#exit`	Exit from the interface mode.
`(config)#interface xe2`	Specify the interface(xe2) to be configured and enter the interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure ipv4 address on the interface xe2.
`(config-if)#ip dhcp relay address 10.10.10.2`	The relay address configured should be server interface address connected to DUT machine.
`(config if)#exit`	Exit from the interface mode.

Validation Commands

```
#show running-config dhcp

interface xe2
 ip dhcp relay address 10.10.10.2

#show ip dhcp relay
```

DHCP Relay Agent Configuration

```
DHCP relay service is Enabled.
Insertion of option 82 is Disabled.
Helper addresses are configured on the following interfaces:
 Interface         Relay Address
--------          ----------- xe2
10.10.10.2

#show ip dhcp relay address
 Interface         Relay Address
--------          ----------- xe2
10.10.10.2

#show ip dhcp relay address interface ethernet eth1
 Interface         Relay Address  -
-------           ------------ xe2
10.10.10.2
```

DHCP Relay for IPv6

DHCP Agent

`#configure terminal`	Enter Configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This is enabled in default.
`(config)#ipv6 dhcp relay`	By default this will be enabled. It starts the ipv6 dhcp relay service.
`(config)#interface xe1`	Specify the interface(xe1) to be configured and enter the interface mode.
`(config-if)#ipv6 address 2001::1/64`	Configure ipv6 address on the interface xe1.
`(config if)#exit`	Exit from the interface mode.
`(config)#interface xe2`	Specify the interface(xe2) to be configured and enter the interface mode.
`(config-if)#ipv6 address 2002::1/64`	Configure ipv6 address on the interface xe2.
`(config-if)#ipv6 dhcp relay address 2001::2`	The relay address configured should be server interface address connected to DUT machine.
`(config if)#exit`	Exit from the interface mode.

Validation Commands

```
#sh ipv6 dhcp relay address
Interface            Relay Address                              Output Interface
--------             -------------                              ---------------
Xe2                   2001::1
```

CHAPTER 12 NTP Client Configuration

Overview

NTP modes differ based on how NTP allows communication between systems. NTP communication consists of time requests and control queries. Time requests provide the standard client/server relationship in which a client requests time synchronization from an NTP server. Control queries provide ways for remote systems to get configuration information and reconfigure NTP servers.

SNTP is a simplified form of NTP that does not reach the level of accuracy compared to a full implementation of NTP. SNTP can be used for simple applications where the requirements for accuracy and reliability are not too demanding. SWMRE supports SNTP version 4, defined in RFC 2030.

Note: SWMRE uses "`ntp`" for the SNTP command names instead of "`sntp`."

Support for Default VRF via In-band Management

SWMRE now offers support for NTP over default and management VRFs via in-band management interface & OOB management interface, respectively.

The feature can either be running on the default or management VRF. By default, it runs on the management VRF.

NTP Modes

The following describes the various NTP node types.

Client

An NTP client is configured to let its clock be set and synchronized by an external NTP timeserver. NTP clients can be configured to use multiple servers to set their local time and are able to give preference to the most accurate time sources. They do not, however, provide synchronization services to any other devices.

Server

An NTP server is configured to synchronize NTP clients. Servers can be configured to synchronize any client or only specific clients. NTP servers, however, will accept no synchronization information from their clients and therefore will not let clients update or affect the server's time settings.

Peer

With NTP peers, one NTP-enabled device does not have authority over the other. With the peering model, each device shares its time information with the others, and each device can also provide time synchronization to the others.

Access Lists

Once a router is synchronized to an NTP time source, it acts automatically as an NTP for any client that requests synchronization or informational control queries.

NTP Client Configuration

NTP allows you to configure ACLs to restrict access to the NTP services on the router. These ACLs can be configured to restrict access based on IP and the following four restrictions:

- Peer – Allows time synchronization requests and control queries and allows the router to synchronize itself to remote systems that pass the ACL.
- Server – Allows time synchronization requests and control queries, but does not allow the router to synchronize itself to remote systems that pass the ACL.
- Serve-only – Allows only time synchronization requests from systems that pass the ACL.
- Query-only – Allows only NTP control queries from systems that pass the ACL.

The two ACLs generally used to restrict access for security reasons are the `peer` and `serve-only` options. For example, if you are using the hierarchical model with the core routers `RouterOne and RouterTwo` providing NTP services for the rest of the routers in your network.

Authentication

For additional security, you can configure your NTP servers and clients to use authentication. Routers support MD5 authentication for NTP. To enable a router to do NTP authentication:

1. Enable NTP authentication with the `ntp authenticate` command.
2. Define an NTP authentication key with the ntp authentication-key vrf management command. A unique number identifies each NTP key. This number is the first argument to the ntp authentication-key vrf management command.
3. 3.Use the ntp trusted-key vrf management command to tell the router which keys are valid for authentication. If a key is trusted, the system will be ready to synchronize to a system that uses this key in its NTP packets. The trusted key should already be configured and authenticated.

NTP Configuration

NTP client, user can configure an association with a remote server. In this mode the client clock can synchronize to the remote server

After configuring the NTP servers, wait a few minutes before you verify that clock synchronization is successful. When the clock synchronization has actually happened, there will be an '*' symbol along with the interface while you give the "`show ntp peers`" command.

Topology

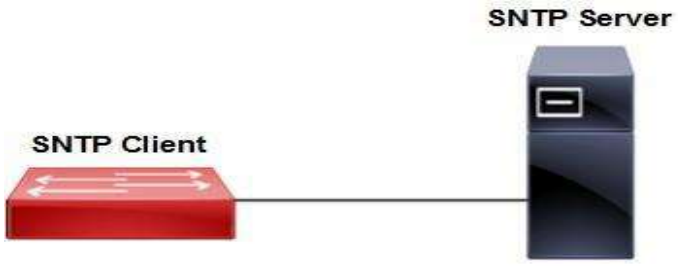

Figure 12-30: SNTP Client and Server

NTP Client Configuration

NTP Client

`#configure terminal`	Enter Configure mode.
`(config)#feature ntp vrf management`	Configure feature on default or management VRF. By default this feature runs on management VRF.
`(config)# ntp enable vrf management`	This feature enables ntp. This will be enabled in default.
`(config)#ntp server 10.1.1.1 vrf management`	Configure ntp server ip address.
`(config)#exit`	Exit from the Configure Mode.

Validation Commands

```
#show ntp peers
    ------------------------------------------------------------
    Peer IP Address Serv/Peer
    ------------------------------------------------------------
    10.1.1.1 Server (configured)

    #show ntp peer-status
    Total peers : 1
    * - selected for sync, + -  peer mode(active), -
    - peer mode(passive), = - polled in client mode
         remote           refid      st t when poll reach   delay   offset  jitter
    ==============================================================================
    *10.1.1.1        LOCAL(0)         7 u   14   32   37    0.194   -4.870   3.314
```

Maxpoll and Minpoll Configuration

The maximum poll interval are specified in defaults to 6 (64 seconds), but can be increased by the `maxpoll` option to an upper limit of 16 (18.2 hours). The minimum poll interval defaults to 4 (16 seconds), and this is also the minimum value of the `minpoll` option.

The client will retry between `minpoll` and `maxpoll` range configured for synchronization with the server.

Client

`#configure terminal`	Enter Configure mode.
`(config)#feature ntp vrf management`	Configure feature on default or management VRF. By default this feature runs on management VRF.
`(config)#ntp server 10.1.1.1 maxpoll 7 minpoll 5 vrf management`	Configure `minpoll` and `maxpoll` range for ntp server.
`(config)#exit`	Exit from the Configure Mode.

Validation Commands

```
#show ntp peers
    ------------------------------------------------------------
    Peer IP Address Serv/Peer
    ------------------------------------------------------------10.1.1.1
    Server (configured)
```

NTP Client Configuration

```
#show   ntp   peer-status
    Total peers : 1
    * - selected for sync, + -  peer mode(active), -
    - peer mode(passive), = - polled in client mode
         remote           refid      st t when poll reach   delay   offset  jitter
    ==============================================================================
    *10.1.1.1        LOCAL(0)         7 u   14   32   37    0.194   -4.870   3.314
```

NTP Authentication

When you enable NTP authentication, the device synchronizes to a time source only if the source carries the authentication keys specified with the source by key identifier. The device drops any packets that fail the authentication check, and prevents them from updating the local clock.

Client

`#configure terminal`	Enter Configure mode.
`(config)#feature ntp vrf management`	Enable feature on default or management VRF. By default this feature runs on management VRF..

(config)#ntp server 10.1.1.1 vrf management	Configure ntp server ip address.
(config)#ntp authenticate vrf management	Enable NTP Authenticate. NTP authentication is disabled by default.
(config)#ntp authentication-key 1234 md5 text vrf management	Configure ntp authentication key along with md5 value.
(config)#ntp trusted-key 1234 vrf management	Configure trusted key <1-65535>
(config)#exit	Exit from the Configure Mode.

Validation Commands

```
#show ntp authentication-status
    Authentication enabled

#show ntp authentication-keys
    --------------------------
     Auth Key       MD5 String
    --------------------------
    1234              SWWX

#show    ntp    trusted-keys
    Trusted Keys:
    1234
```

CHAPTER 13 Simple Network Management Protocol

Overview

SNMP provides a standardized framework and a common language for monitoring and managing devices in a network. The SNMP framework consists of three parts:

- An SNMP manager: The system used to control and monitor the activities of network devices. This is sometimes called a Network Management System (NMS).
- An SNMP agent: The component within a managed device that maintains the data for the device and reports these data SNMP managers.
- Management Information Base (MIB): SNMP exposes management data in the form of variables which describe the system configuration. These variables can be queried (and sometimes set) by SNMP managers.

In SNMP, administration groups are known as communities. SNMP communities consist of one agent and one or more SNMP managers. You can assign groups of hosts to SNMP communities for limited security checking of agents and management systems or for administrative purposes. Defining communities provides security by allowing only management systems and agents within the same community to communicate.

A host can belong to multiple communities at the same time, but an agent does not accept a request from a management system outside its list of acceptable community names.

SNMP access rights are organized by groups. Each group is defined with three accesses: read access, write access, and notification access. Each access can be enabled or disabled within each group.

The SNMP v3 security level determines if an SNMP message needs to be protected from disclosure and if the message needs to be authenticated. The security levels are:

- noAuthNoPriv: No authentication or encryption
- authNoPriv: Authentication but no encryption
- authPriv: Both authentication and encryption SNMP is defined in RFCs 3411-3418.

Topology

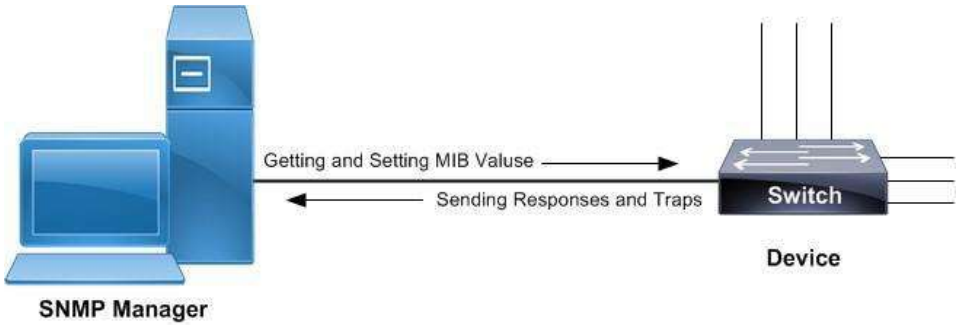

Figure 13-31: SNMP sample topology

Simple Network Management Protocol

Standard SNMP Configurations

`#configure terminal`	Enter Configure mode.
`(config)#snmp-server view all .1 included vrf management`	Creates SNMP view labeled as “all” for OID-Tree as “.1” for vrf management.
`(config)#snmp-server community test group network-operator vrf management`	Set community string as “test” for group of users having “network-operator” privilege.
`(config)#snmp-server host 10.12.6.63 traps version 2c test udp-port 162 vrf management`	Specify host “10.12.6.63” to receive SNMP version 2 notifications at udp port number 162 with community string as “test”.
`(config)#exit`	Exit configure mode.

Validation

Use the below commands to verify the SNMP configuration:

```
#show running-config snmp snmp-server view all
.1 included vrf management
snmp-server community test group network-operator vrf management snmp-server
host 10.12.6.63 traps version 2c test udp-port 162 vrf management
```

```
#show snmp group
-------------------------------------------------------------------------------
community/user    group          version   Read-View    Write-view    Notify-view
-------------------------------------------------------------------------------
test          network-operator    2c/1       all         none            all

#show snmp host
-------------------------------------------------------------------------------
Host                Port    Version   Level          Type            SecName
-------------------------------------------------------------------------------
10.12.6.63          162     2c        noauth         trap            test
```

SNMP GET Command

```
# snmpget -v2c -c test 10.12.45.238
.1.3.6.1.2.1.6.13.1.2.10.12.45.238.22.10.12.6.63.52214

TCP-MIB::tcpConnLocalAddress.10.12.45.238.22.10.12.6.63.52214 = IpAddress:
10.12.45.238
```

SNMP WALK Command

SNMP WALK for particular OID

```
#snmpwalk -v2c -c test 10.12.45.238 .1.3.6.1.2.1.25.3.8.1.8 HOST-

Complete SNMP WALK

```
#snmpwalk -v2c -c test 10.12.45.238 .1
```

SNMP WALK Command

```
#snmpset -v2c -c test 10.12.45.102 1.3.6.1.2.1.10.246.1.2.1.30.1 u 123
iso.3.6.1.2.1.10.246.1.2.1.30.1 = Gauge32: 123
```

CHAPTER 14 Access Control Lists Configurations

This chapter contains a complete example of access control list (ACL) configuration.

Overview

An Access Control List is a list of Access Control Entries (ACE). Each ACE in ACL specifies the access rights allowed or denied.

Each packet that arrives at the device is compared to each ACE in each ACL in the order they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

Note: If there is no match, the packet is dropped (implicit deny). Therefore, an ACL intended to deny a few selected packets should have at least one permit filter of lower priority; otherwise, all traffic is dropped because of the default implicit deny filter.

Topology

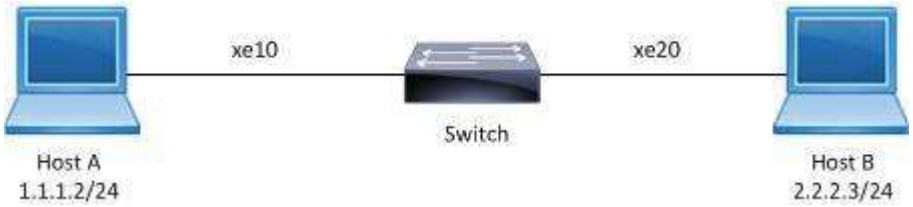

Figure 14-32: ACL sample topology

IPv4 ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ip access-list T1`	Create an IP access list named T1.
`(config-ip-acl)#deny any host 1.1.1.1 any`	Create an access rule to deny IP packets with source address 1.1.1.1.
`(config-ip-acl)#permit any host 1.1.1.1/24 any`	Create an access rule to permit IP packets with source address 1.1.1.1.
`(config-ip-acl)#exit`	Exit access list mode.
`(config)#interface xe10`	Enter interface mode.
`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ip address 1.1.1.3/24`	Assign an IP address.
`(config-if)#ip access-group T1 in`	Apply access group T1 for inbound traffic to the interface.
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound IP packets reach interface xe10 with source address 1.1.1.1, then the match count for access rule 10 increases equal to the number of packets sent.

```
#show ip access-lists T1
    IP access list T1
            10 deny any host 1.1.1.1 any [match=200]
            20 permit any 1.1.1.1/24 any
            default deny-all
```

When inbound IP packets reach interface xe10 with a source address in the range from 1.1.1.1 to 1.1.1.254, then the match count for access rule 20 increases equal to the number of packets sent.

```
#show ip access-lists T1
    IP access list T1
        10 deny any host 1.1.1.1 any
        20 permit any 1.1.1.1/24 any
    [match=2000] default deny-all
```

Note: Use the command `clear ip access-list counters` to clear the statistics of all ACLs or `clear ip access-list <access-list name> counters` to clear statistics of a particular ACL.

ICMP ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ip access-list icmp-acl-01`	Create an IP access list named icmp-acl-01.
`(config-ip-acl)#10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 fragments`	Create an access rule with sequence number 10 to deny ICMP packets from a specific source towards a specific destination with a DSCP value of af11. Note: The sequence number is optional.
`(configip-acl)#20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash`	Create an access rule with sequence number 20 to permit ICMP packets from a specific source towards a specific destination with precedence as flash.
`(config-ip-acl)#exit`	Exit access list mode.
`(config)#interface xe10`	Enter interface mode.
`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ip address 1.1.1.3/24`	Assign an IP address.
`(config-if)#ip access-group icmp-acl-01 in`	Apply access group icmp-acl-01 for inbound traffic to the interface.
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound IP packets reach interface xe10 with source address 1.1.1.X, destination address 2.2.2.X, DSCP value af11, and are fragmented, then the count for access rule 10 increases equal to the number of packets sent.

```
#show ip access-lists icmp-acl-01
IP access-list icmp-acl-01
```

```
    10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 [match=200]
    20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
default deny-all
```

When inbound IP packets reach interface xe10 with source address as 1.1.1.X, destination address 2.2.2.X, and precedence value flash, then the count for access rule 20 increases equal to the number of packets sent.

```
#show ip access-lists icmp-acl-01
IP access-list icmp-acl-01
    10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11
    20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
[match=200] default deny-all
```

Note: Use the command `clear ip access-list counters` to clear statistics of all ACLs configured or `clear ip access-list <access-list name> counters` to clear statistics of a particular ACL.

Access List Entry Sequence Numbering

You can change the sequence numbers of rules in an access list.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

`#configure terminal`	Enter configure mode.
`(config)#ip access-list icmp-acl-01`	Enter access list mode for ACL icmp-acl-01.
`(config-ip-acl)#resequence 100 200`	Re-sequence the access list, starting with sequence number 100 and incrementing by 200.
`(config-ip-acl)#1000 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11`	Re-sequencing specific access rule 100 with sequence number 1000
`(config-ip-acl)#exit`	Exit access list mode.

Validation

Before re-sequencing:

```
#show access-lists icmp-acl-01
IP access list icmp-acl-01
        10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 log
20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
default deny-all
```

After re-sequencing the access list, starting with sequence number 100 and incrementing by 200

```
#show access-lists icmp-acl-01
IP access list icmp-acl-01
        100 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 log
300 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence
flash default deny-all
```

After re-sequencing specific access rule 100 with sequence number 1000

```
 #show access-lists icmp-acl-01
IP access list icmp-acl-01
```

```
300 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
1000 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11
log default deny-all
```

IPv6 ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ipv6 access-list ipv6-acl-01`	Create an IPv6 access list named as icmp-acl-01.
`(config-ipv6-acl)#11 deny ip any any flow-label 100`	Create access rule sequence number 11 to deny IPv4 encapsulated packets in IPv6 with any source address to any destination address with flow label 100.
`(config-ipv6-acl)#default permit-all`	Update the default rule to permit all.
`(config-ipv6-acl)#exit`	Exit access list mode
`(config)#interface xe10`	Enter interface mode.
`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ipv6 address 1:1::1:3/64`	Assign an IPv6 address.
`(config-if)# ipv6 access-group ipv6-acl-01 in`	Apply access group ipv6-acl-01 for inbound traffic to the interface.
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound IPv6 packets reach interface xe10 with IPv4 packets encapsulated with flow label 100, then count for access rule 11 increases equal to the number of packets sent.

```
#show ipv6 access-lists ipv6-acl-01
IPv6 access-list ipv6-acl-01
    11 deny ip any any flow-label 100
[match=1000] default permit all
```

For all other IPv6 packets, access rule 100 is invoked and the match counts increase equal to the number of packets sent.

```
#show ipv6 access-lists ipv6-acl-01
IPv6 access-list ipv6-acl-01
    11 deny ip any any flow-label 100
default permit-all [match=2000]
```

Note: Use the command `clear ipv6 access-list counters` to clear statistics of all IPv6 ACLs configured or `clear ipv6 access-list <ipv6 access-list name> counters` to clear statistics of the particular IPv6 ACL.

MAC ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#mac access-list mac-acl-01`	Create a MAC access list named mac-acl-01.

(config-mac-acl)#22 permit host 0000.0011.1212 host 0000.1100.2222 vlan 2	Create an access rule with sequence number 22 to permit packets from a host with a specific MAC towards a host with a specific MAC with VLAN 2.
(config-mac-acl)#exit	Exit access list mode.
(config)#bridge 1 protocol rstp vlanbridge	Create a VLAN-aware RSTP bridge.
(config)#vlan 2 bridge 1 state enable	Create VLAN 2.
(config)#interface xe10	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2.
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)# mac access-group mac-acl-01 in	Applies the MAC access list mac-acl-01 to ingress traffic.
(config-if)#end	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound packets reach interface xe10 with the specific source and destination MAC with the VLAN as 2, then the count for access rule 22 increases equal to the number of packets sent.

```
#show mac access-lists
    MAC access list mac-acl-01
        22 permit mac host 0000.0011.1212 host 0000.1100.2222 vlan 2 [match=3000]
    default deny-all
```

For all other packets, default rule is invoked and the match counts increases equal to the number of packets sent.

```
#show mac access-lists mac-acl-01
    MAC access list mac-acl-01
        22 permit mac host 0000.0011.1212 host 0000.1100.2222 vlan 2
    default deny-all [match=2000]
```

Note: As per the present design, ARP/ND packets will be filtered based on the source MAC address only (host mac address).

Note: Use the command `clear mac access-list counters` to clear statistics of all MAC ACLs or `clear mac access-list <mac access-list name> counters` to clear statistics of a particular MAC ACL.

Management ACL Overview

Management Port ACL can be used to provide basic level of security for accessing the management network. ACLs can also be used to decide which types of management traffic to be forwarded or blocked at the management port.

When configuring access list on a router or a switch, each access list needs to be identified by a unique name or a number. Each access list entry can have permit or deny actions. Each entry will be associated with a sequence number in the range of <1-268435453>. Lower the sequence number, higher the priority.

User should be able to configure the system to allow certain IP address for a protocol and don't allow any other IP address matching for that protocol.

Note: If there is no match, the packet is dropped (implicit deny). Therefore, an ACL intended to deny a few selected packets should have at least one permit filter of lower priority; otherwise, all traffic is dropped because of the default implicit deny filter.

Topology

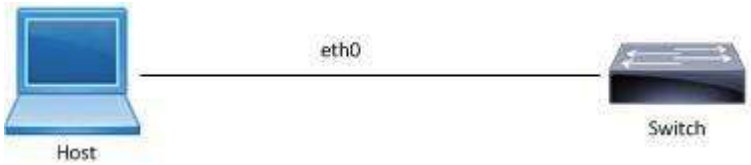

Figure 14-33: Management ACL Sample Topology

Management ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ip access-list mgmt`	Create an IP access list named mgmt
`(config-ip-acl)#permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh`	Create an access rule to permit TCP connection with source address 10.12.45.57 with destination address 10.12.29.49 on destination port equal to SSH.
`(config-ip-acl)#permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet`	Create an access rule to permit TCP connection with source address 10.12.45.58 with Destination address 10.12.29.49 on destination port equal to Telnet.
`(config-ip-acl)#permit udp any host 10.12.29.49 eq snmp`	Create an access rule to permit UDP packet with any source address with Destination address 10.12.29.49 on destination port equal to SNMP.
`(config-ip-acl)#permit udp any host 10.12.29.49 eq ntp`	Create an access rule to permit UDP packet with any source address with Destination address 10.12.29.49 on destination port equal to NTP.
`(config-ip-acl)#permit udp host 10.12.29.49 any eq snmptrap`	Create an access rule to permit UDP packet with source address 10.12.29.49 with any Destination address on destination port equal to SNMPTrap.
`(config-ip-acl)#permit tcp host 10.12.29.49 eq ssh host 10.12.45.57`	Create an access rule to permit TCP connection with source address 10.12.29.49 on source port equal to ssh with Destination address 10.12.45.57 .
`(config-ip-acl)#deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh`	Create an access rule to deny TCP connection with source address 10.12.45.58 with Destination address 10.12.29.49 on destination port equal to SSH.
`(config-ip-acl)# deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet`	Create an access rule to deny TCP connection with source address 10.12.45.57 with Destination address 10.12.29.49 on destination port equal to Telnet.
`(config-ip-acl)#exit`	Exit access list mode.
`(config)#interface eth0`	Enter interface mode of Management Interface.
`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ip address 10.12.29.49/24`	Assign an IP address.

(config-if)#ip access-group mgmt in	Apply access group mgmt for inbound traffic to the interface.
(config-if)#end	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When a TCP connection for Destination Port SSH reach interface eth0 with source address 10.12.45.57, then the match count for access rule 10 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh [match=9]
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
    80 deny tcp host 10.12.45.57 host 10.12.29.49 eq
    telnet default deny-all
```

When a TCP connection for Destination Port Telnet reach interface eth0 with source address 10.12.45.58, then the match count for access rule 20 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet [match=10]
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
    80 deny tcp host 10.12.45.57 host 10.12.29.49 eq
    telnet default deny-all
```

When a UDP packet for Destination Port SNMP reach interface eth0 with any source address, then the match count for access rule 30 increases equal to the number of packets sent. Prior to this SNMP should be configured on Device (10.12.29.49).

```
    Example: snmp-server community SNMPTEST group network-admin vrf
    management snmp-server host 10.12.6.86 traps version 2c SNMPTEST udp-
    port 162 vrf management
    snmp-server enable snmp  vrf management

    #show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp [match=50]
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
```

```
        70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
    80 deny tcp host 10.12.45.57 host 10.12.29.49 eq
    telnet default deny-all
```

When a UDP packet for Destination Port NTP reach interface eth0 with any source address, then the match count for access rule 40 increases equal to the number of packets sent. Prior to this NTP should be configured on Device (10.12.29.49).

```
    Example:
    ntp enable vrf management ntp
    authenticate vrf management
    ntp authentication-key 123 md5 swwx 7 vrf
    management ntp trusted-key 123 vrf management ntp
    server 10.12.45.36 vrf management ntp server
    10.12.16.16 prefer vrf management
    ntp server 10.12.16.16 key 123 vrf management

#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp [match=1]
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
    80 deny tcp host 10.12.45.57 host 10.12.29.49 eq
    telnet default deny-all
```

When a TCP connection request for Destination Port SSH reach interface eth0 with source address 10.12.45.58, this should deny the connection and the match count for access rule 70 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
    [match=1]         80 deny tcp host 10.12.45.57 host 10.12.29.49 eq
    telnet         default deny-all
```

When a TCP connection request for Destination Port Telnet reach interface eth0 with source address 10.12.45.57, this should deny the connection and the match count for access rule 80 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
```

```
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
            80 deny tcp host 10.12.45.57 host 10.12.29.49 eq
    telnet[match=1] default deny-all
```

To enable SNMPTRAPS, apply the ACL outbound to the Management interface.

`#configure terminal`	Exit access list mode.
`(config)#interface eth0`	Enter interface mode of Management Interface.
`(config-if)#ip access-group mgmt out`	Apply access group mgmt for outbound traffic to the interface.
`(config-if)#end`	Exit interface and configure mode.

When a UDP packet for Destination Port SNMPTrap sends out of interface eth0 with any Destination address, then the match count for access rule 50 increases equal to the number of packets received. Prior to this SNMPTrap should be configured on Device (10.12.29.49) to listen to port 162.

```
    Example: snmp-server community SNMPTEST group network-admin vrf
    management snmp-server host 10.12.6.86 traps version 2c
    SNMPTEST udp-port 162 vrf management snmp-server enable snmp
    vrf management

#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap [match=5]
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
    80 deny tcp host 10.12.45.57 host 10.12.29.49 eq
    telnet default deny-all
```

When an ACL is applied on interface eth0 outbound and inbound together, then we must configure an ACL to establish a TCP connection between source 10.12.29.49 with source Port SSH to destination address 10.12.45.57. When a TCP connection is established on port SSH, then the match count for access rule 10 and 60 increases equal to the number of packets sent and received.

```
#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh [match=9]
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57[match=9]
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
    80 deny tcp host 10.12.45.57 host 10.12.29.49 eq
    telnet default deny-all
```

Note: Use the command `clear ip access-list counters` to clear the statistics of all ACLs or `clear ip access-list <access-list name> counters` to clear statistics of a particular ACL.

```
#show access-lists
    IP access list mgmt

ARP ACL Overview

ARP ACL can be used to permit or deny the ARP packets, based on the ARP request or response option configured.

Topology

Figure 14-34: ARP ACL Sample Topology

ARP ACL Configuration

#configure terminal	Enter configure mode.
(config)#interface ge4	Enter interface mode.
(config-if)#ip address	Assign IPv4 address.
(config-if)#exit	Exit access list mode.
(config)# mac access-list mac1	Enter mac access list mode.
(config-mac-acl)#permit 0000.3ae0.456d.0000.0000.0000 any arp request	Create an access rule to permit specific ARP request.
(config-mac-acl)#permit 0000.3ae0.456d.0000.0000.0000 any arp response	Create an access rule to permit specific ARP response.
(config-mac-acl)#permit any any ipv4	Create an access rule to permit any IPv4 packet.
(config-mac-acl)#exit	Exit access list mode.
(config)#interface ge4	Enter interface mode.
(config-if)#mac access-group mac1 in	Apply access group mac1 for inbound traffic to the interface.
(config-if)#end	Exit interface and configure mode.

Validation

Use the commands below to assign IP address on IXIA and ping from IXIA.

```
#show mac access-lists
    MAC access list mac1
            10 permit host 0000.3AE0.456D any arp request [match=1]
            20 permit host 0000.3AE0.456D any arp response [match=1]
            30 permit any any ipv4 [match=1] default deny-
    all
```

CHAPTER 15 Show Tech Support Configurations

Overview

SWMRE maintains a collection of consolidated information about system configurations and statistics. This information is for debugging and diagnosing system issues, and can be uploaded to a remote server. You generate a file with this information via the `show techsupport` command.

Note: Output is not displayed on the terminal.

The default directory (`/var/log/`) is where the stored information is saved. The filename has the form:

`tech_support_YYYY_MMM_DD_HH_MM_SS.tar.gz`. If a file name is specified, the information will be saved to `filename_YYYY_MMM_DD_HH_MM_SS_.tar.gz`. Date stamps are in the `YYYY_MM_DD` form, and time stamps are in the form `HH_MM_SS`.

The collected system data contains the following logs:

- Saved start-up configuration of the system.
- The `running-config`, and statistics for a specified module or all modules.
- The last 100 commands.
- Memory and CPU usage of the process.
- Process Id and process name.
- The user account running the process.

Tech Support Samples

`#show techsupport all`	Collects system configurations and statistics for all modules, and saves it in `tech support date timestamp.tar.gz` in the `/var/log/` directory.
`#show techsupport all log-path /home/filename`	Collects system configurations and statistics for all modules, and saves it in `filename date timestamp.tar.gz` in the `/home/directory`.
`#show techsupport nsm`	Collects `nsm` protocol configurations and statistics, and saves it in `tech support date timestamp.tar.gz` in the `/var/log/` directory.
`#show techsupport nsm log-path /home/filename`	Collects `nsm` protocol configurations and statistics, and saves it at `filename_date_timestamp.tar.gz` in the `/home/directory`.
`#show techsupport hostpd authd imi`	Collects `hostp`, `authd`, and `imi` protocol configurations and statistics and saves it at `tech_support_date_timestamp.tar.gz` in the `/var/log/` directory.

`#show techsupport hostpd authd imi logpath /home/filename`	Collects `hostp, authd, imi` protocol configurations and statistics, saves it as `filename date timestamp.tar.gz` in the `/home/` directory.

Show Tech Support Configurations

Validation Commands

You can display the status of a `show techsupport` command given earlier which indicates the protocol modules that have completed, are in progress, or have not executed. If the command has completed, it lists the last five generated tech support files with their path.

```
#show techsupport status

Tech Support Command Execution Is Complete
##Generated Tech Support File-list
/var/log/tech_support_18_Dec_2017_20_39_02.tar.gz #
```

Note: the running `show techsupport` operation has not completed, reentering the `show techsupport` command is ignored.

CHAPTER 16 Route-map Continue Configuration

This section contains Route-map continue configuration with BGP.

Overview

The continue clauses allow you to configure and organize more modular policy definitions to reduce the number of policy configurations that are repeated within the same route map.

Continue clause under a route-map provides the capability to execute additional entries in a route map after an entry is executed with a successful match and set clauses. The continue command allows multiple entries to be evaluated within a single route-map. Continue commands can be assigned optional sequence numbers that indicates the order in which clauses are to be evaluated.

Using Continue with Match Clauses

When a `match` clause exists in a route-map with continue clause then `continue` clause is executed only when a successful match occurs. If a `match` clause does not exist in the route-map and if a `continue` clause exists, the `continue` clause will be evaluated and will go to the specified route-map entry. When a successful match occurs and we have a `continue` clause, the route-map executes the `set` clauses and then goes to the specified route-map entry. If a `continue` clause does not exist in the next route map, then the route-map will behave normally. If a `continue` clause exists in the next route-map but a match is not successful, the route-map will not continue and will “fall through” to the next sequence number if one exists

Using Continue with Set Actions

`Set` clauses are executed after the route-map evaluation is done. The `set` clauses are evaluated and executed in the order in which they were configured. `Set` clauses are only executed after a successful match occurs. The `continue` statement proceeds to the specified route-map entry only after configured `set` actions are performed. If a `set` action is configured in the first route-map and then the same `set` action occurs again but with a different value, in a subsequent route-map entry, then the last `set` action will override the previous `set` actions which were configured with the same set command.

Topology

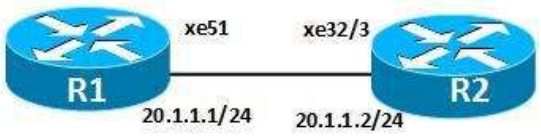

Figure 16-35: Route-map continue

Configure Route-map *continue* on R1

In the below example we will apply route-map `continue` on R1 under BGP 100, with redistributed connected routes from R2 on R1. Here, 10.1.0.0/16 is a superset, while 10.1.1.0/24, 10.1.2.0 /24, 10.1.3.0/24, 10.1.4.0/24, and 10.1.5.0/24 are subsets and will filter PF1, which is a superset and sets several prefixes.

R1

R1#configure terminal	Enter configure mode.
R1(config)#interface xe51	Enter interface mode.
R1(config-if)#ip address 20.1.1.1/24	Configure the IP address of the interface.
R1(config-if)#exit	Exit interface mode.
R1(config)#ip prefix-list PF1 seq 5 permit 10.1.0.0/16 le 32	Configure super set prefix PF1
R1(config)#ip prefix-list P1 seq 5 permit 10.1.1.0/24 le 32	Configure subset prefix P1
R1(config)#ip prefix-list P2 seq 5 permit 10.1.2.0/24 le 32	Configure subset prefix P2
R1(config)#ip prefix-list P3 seq 5 permit 10.1.3.0/24 le 32	Configure subset prefix P3
R1(config)#router bgp 100	Configure bgp process 100
R1(config-router)#bgp router-id 1.1.1.1	Configure bgp router id
R1(config-router)#neighbor 20.1.1.2 remoteas 100	Configure bgp remote-as 100 with neighbor IP
R1(config-router)#neighbor 20.1.1.2 routemap myid1 in	Configure bgp route-map myid1 as In bound policy with neighbor ip
R1(config-routed)#exit	Exit the router bgp mode
R1(config)#route-map myid1 permit 1	Configure route-map myid1 with sequence number 1
R1(config-route-map)match ip address prefixlist PF1	Match for prefix PF1
R1(config-route-map)continue	Configure continue command without sequence number
R1(config-route-map)set metric 10	Set metric as 10
R1(config-route-map)set weight 3465789	Set weight as 3465789
R1(config-route-map)route-map myid1 permit 2	Configure route-map myid1 with sequence number 2
R1(config-route-map)match ip address prefixlist P1	Match for IP prefix-list P1
R1(config-route-map)continue 3	Configure continue with sequence number 3
R1(config-route-map)set metric 20	Set metric as 20.
R1(config-route-map)set origin igp	Set origin as IGP protocol
R1(config-route-map)route-map myid1 permit 3	Configure route-map myid1 with sequence number 3
R1(config-route-map)match ip address prefixlist P2	Match for IP prefix-list P2
R1(config-route-map)continue 4	Configure continue with sequence number 4
R1(config-route-map)set metric 30	Set metric as 30.
R1(config-route-map)set as-path prepend 600	Set as-path prepend as 600
R1(config-route-map)route-map myid1 permit 4	Configure route-map myid1 with sequence number 4

R1(config-route-map)match ip address prefixlist P3	Match for IP prefix-list P3.
R1(config-route-map)set local-preference 400	Set local preference as 400
R1(config-route-map)set weight 400	Set weight as 400
R1(config-route-map)end	End the route-map

R2

R2#configure terminal	Enter configure mode.
R2(config)#interface xe32/1	Enter interface mode.
R2(config-if)#ip address 10.1.1.1/24	Configure the IP address of the interface on an interface which is up and running
R2(config-if)#interface xe32/2	Enter interface mode.
R2(config-if)#ip address 10.1.2.1/24	Configure the IP address of the interface on an interface which is up and running
R2(config-if)#interface xe32/4	Enter interface mode.
R2(config-if)#ip address 10.1.3.1/24	Configure the IP address of the interface on an interface which is up and running
R2(config-if)#interface xe17/1	Enter interface mode.
R2(config-if)#ip address 10.1.4.1/24	Configure the IP address of the interface on an interface which is up and running
R2(config-if)#interface xe21/1	Enter interface mode.
R2(config-if)#ip address 10.1.5.1/24	Configure the IP address of the interface on an interface which is up and running
R2(config-if)#interface xe32/3	Enter interface mode.
R2(config-if)#ip address 20.1.1.2/24	Configure the IP address on the connected interface.
R2(config-if)#exit	Exit interface mode.
R2(config)#router bgp 100	Configure BGP process 100
R2(config-router)#bgp router-id 2.2.2.2	Configure BGP router id
R2(config-router)#redistribute connected	Redistribute the connected routes which are 10 networks here.

System Management Command Reference

Contents

This document contains these chapters and appendices:

- Chapter 1, *Dynamic Host Configuration Protocol Client*
- Chapter 2, *Domain Name System*
- Chapter 3, *Secure Shell*
- Chapter 4, *Simple Network Management Protocol*
- Chapter 6, *Syslog*
- Chapter 5, *Telnet*
- Chapter 7, *User Management*
- Chapter 8, *Network Time Protocol*
- Chapter 9, *Dynamic Host Configuration Protocol Relay*
- Chapter 10, *Remote Management*
- Chapter 11, *Software Monitoring and Reporting*

CHAPTER 1 Dynamic Host Configuration Protocol Client

This chapter describes the Dynamic Host Configuration Protocol (DHCP) client commands.

DHCP is used to configure devices that are connected to a network so they can communicate on that network using the Internet Protocol (IP). DHCP is implemented in a client-server model where DHCP clients request configuration data, such as an IP address, a default route, or DNS server addresses from a DHCP server.

This chapter contains these commands:

- feature dhcp
- ip address dhcp
- ip dhcp client request

feature dhcp

Use this command to enable the DHCP client and DHCP relay on the device.

Use the `no` form of this command to disable the DHCP client and DHCP relay and delete any DHCP-related configuration.

Command Syntax `feature dhcp`

`no feature dhcp`

Parameters

None

Default

By default, feature dhcp is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#feature dhcp
```

ip address dhcp

Use this command to get an IP address from a DHCP server for this interface.

Use the `no` form of this command to disable the DHCP client for this interface.

You can give the ip dhcp client request command before giving this command to request additional options.

Command Syntax `ip address dhcp no ip address dhcp`

Parameters

None

Default

No default value is specified.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip address dhcp
(config-if)#
```

Dynamic Host Configuration Protocol Client

ip dhcp client request

Use this command to add an option to a DHCP request.

Use the `no` form of this command to remove an option from a DHCP request.

Command Syntax `ip dhcp client request dns-nameserver ip dhcp client request host-name ip dhcp client request log-server ip dhcp client request ntp-server no ip dhcp client request dns-nameserver no ip dhcp client request host-name no ip dhcp client request log-server no ip dhcp client request ntp-server`

Parameters `dns-nameserver` List of DNS name servers (DHCP option 6) `host-name` Name of the client (DHCP option 12) `ntp-server` List of NTP servers (DHCP option 42) `log-server` List of log servers (DHCP option 7)

Default

By default, ip dhcp client request is enabled

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip dhcp client request ntp-server
```

CHAPTER 2 Domain Name System

This chapter describes Domain Name System (DNS) commands. DNS translates easily-to-remember domain names into numeric IP addresses needed to locate computer services and devices. By providing a worldwide, distributed keyword-based redirection service, DNS is an essential component of the Internet.

The DNS database is hierarchical. When a client such as a Web browser gives a request that specifies a host name, the DNS resolver on the client first contacts a DNS server to determine the server's IP address. If the DNS server does not contain the needed mapping, it forwards the request to a different DNS server at the next higher level in the hierarchy. After potentially several forwarding and delegation messages are sent within the DNS hierarchy, the IP address for the given host eventually arrives at the resolver, that in turn completes the request over Internet Protocol (IP).

Note: The commands below are supported only on the “management” VRF.

The chapter contains these commands:

- debug dns client
- ip domain-list
- ip domain-lookup
- ip domain-name
- ip host
- ip name-server
- show hosts
- show running-config dns

© Symanitron

debug dns client

Use this command to display DNS debugging messages.

Use the `no` form of this command to stop displaying DNS debugging messages.

Command Syntax `debug dns client no debug dns client`

Parameters

None

Default

By default, disabled.

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#debug dns client
```

ip domain-list

Use this command to define a list of default domain names used to complete unqualified host names. Each domain in the list is to be tried in turn.

The `ip domain-list` command is similar to the ip domain-name command, except that with the `ip domain-list` command you can define a list of domains, each to be tried in turn.

If there is no domain list, the default domain name specified with the `ip domain-name` command is used. If there is a domain list, the default domain name is not used. Use the `no` form of this command to remove a domain.

Command Syntax `ip domain-list (vrf management|)`
`DOMAIN-NAME no ip domain-list (vrf management|)`
`DOMAIN-NAME`

Parameters

`management`	Virtual Routing and Forwarding name
`DOMAIN-NAME`	Domain name, such as company.com

Default

No default is specified.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip domain-list mySite.com
```

ip domain-lookup

Use this command to enable DNS host name-to-address translation.

Use the `no` form of this command to disable DNS.

Command Syntax `ip domain-lookup (vrf management|) no ip domain-lookup (vrf management|)`

Parameters `management` Virtual Routing and Forwarding name

Default

No default is specified.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip domain-lookup
```

ip domain-name

Use this command to set the default domain name used to complete unqualified host names (names without a dotteddecimal domain name).

The ip domain-list command is similar to the `ip domain-name` command, except that with the `ip domain-list` command you can define a list of domains, each to be tried in turn.

If a domain list has been created with `ip domain-list`, the default domain name is not used. If there is no domain list, the default domain name is used.

Use the `no` form of this command to disable DNS.

Command Syntax `ip domain-name (vrf management|) DOMAIN-NAME no ip domain-name (vrf management|) DOMAIN-NAME`

Parameters

`management`	Virtual Routing and Forwarding name
`DOMAIN-NAME`	Domain name, such as company.com

Default

No default is specified.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip domain-name company.com
```

ip host

Use this command to define static hostname-to-address mappings in DNS. You can specify one or two mappings in a command.

Use the `no` form of this command remove a hostname-to-address mapping.

Command Syntax `ip host (vrf management|) WORD A.B.C.D ip host (vrf management|) WORD A.B.C.D A.B.C.D ip host (vrf management|) WORD (X:X::X:X | A.B.C.D) ip`

```
host (vrf management|) WORD (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D) no
ip host (vrf management|) WORD A.B.C.D no ip host (vrf management|) WORD
A.B.C.D A.B.C.D no ip host (vrf management|) WORD (X:X::X:X | A.B.C.D)
```

```
no ip host (vrf management|) WORD (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D)
```

Parameters

`management`	Virtual Routing and Forwarding name
`WORD`	Host name, such as company.com
`X:X::X:`	IPv6 address of the host
`X`	IPv4 address of the host
`A.B.C.D`	

Default

No default is specified.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip host company.com 192.0.2.1
```

ip name-server

Use this command to add 1-3 DNS server addresses that are used to translate hostnames to IP addresses.

Use the `no` form of this command to remove 1-3 DNS server addresses.

Command Syntax `ip name-server (vrf management|) A.B.C.D ip name-server (vrf management|)(A.B.C.D) (A.B.C.D) ip name-server (vrf management|) (A.B.C.D) (A.B.C.D) (A.B.C.D) ip name-server (vrf management|) (X:X::X:X | A.B.C.D) ip name-server (vrf management|) (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D) ip name-server (vrf management|) (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D) no ip name-server (vrf management|) A.B.C.D no ip name-server (vrf management|) A.B.C.D A.B.C.D no ip name-server (vrf management|) A.B.C.D A.B.C.D A.B.C.D no ip name-server (vrf management|) (X:X::X:X | A.B.C.D) no ip name-server (vrf management|) (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D) no ip name-server (vrf management|) (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D)`

Parameters

`management`	Virtual Routing and Forwarding name
`A.B.C.D`	IPv4 address of the host
`X:X::X:X`	IPv6 address of the host

Default

No default is specified.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip name-server 123.70.0.23
```

show hosts

Use this command to display the DNS name servers and domain names.

Command Syntax `show hosts (vrf management|all)`

Parameters

`vrf`	management or all VRFs

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following is a sample output of this command displaying two name servers: 10.10.0.2 and 10.10.0.88.

```
#show hosts
Default domain is mySite.com
Domain list: myOtherSite.com
Name/address lookup uses domain service
Name servers are 10.10.0.2 10.10.0.88
```

show running-config dns

Use this command to show the DNS settings of the running configuration.

Command Syntax `show running-config dns (vrf management|)`

Parameters

`vrf`	management

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show running-config dns ip domain-lookup ip name-server
10.10.10.10 !
```

CHAPTER 3 Secure Shell

This chapter describes Secure Shell (SSH) commands.

SSH is a cryptographic protocol for secure data communication, remote login, remote command execution, and other secure network services between two networked computers.

Note: The commands below are supported only on the “management” VRF.

This chapter contains these commands:

- clear ssh hosts
- debug ssh server
- feature ssh
- show debug ssh-server
- show running-config ssh server
- show ssh key
- show ssh server
- show username
- ssh
- ssh6
- ssh algorithm encryption
- ssh key
- ssh login-attempts
- ssh server port

- username sshkey
- username keypair

clear ssh hosts

Use this command to clear the `known_hosts` file.

This command clears all trusted relationships established with SSH servers during previous connections. When a client downloads a file from an external server the first time, the client stores the server keys in the `known_hosts` file. After that, other connections to the same server will use the server keys stored in the `known_hosts` file. In other words, a trusted relationship is created when a client accepts the server keys the first time.

An example of when you need to clear a trusted relationship is when SSH server keys are changed.

Command Syntax `clear`

```
ssh hosts
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear ssh hosts
```

debug

ssh server

Use this command to display SSH server debugging information.

Use the `no` form of this command to stop displaying SSH server debugging information.

Command Syntax `debug ssh server no debug ssh server`

Parameters

None

Default

By default, disabled.

Command Mode

Executive mode and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#debug ssh server
```

feature ssh

Use this command to enable the SSH server.

Use the `no` form of this command to disable the SSH server.

Command Syntax `feature ssh (vrf management|) no feature ssh (vrf management|)`

Parameters `management` Virtual Routing and Forwarding name

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)feature ssh
```

show

debug ssh-server

Use this command to display whether SSH debugging is enabled.

Command Syntax `show debug ssh-server`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show debug ssh-server ssh server debugging enabled
```

show running-config ssh server

Use this command to display SSH settings in the running configuration.

Command Syntax `show running-config ssh server`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show running-config ssh server feature ssh
```

show ssh key

Use this command to display the SSH server key.

Command Syntax `show`

```
ssh key
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show ssh key

show ssh server

Use this command to display the SSH server status.

Command Syntax `show ssh server`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show ssh server ssh server enabled port: 22 authentication-retries 3
```

show

username

Use this command to display the RSA or DSA key pair for a user.

Command Syntax `show username USERNAME`

`keypair`

Parameters

`USERNAME`	User identifier

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3 1.

Examples

```
#show username kedar keypair

ssh

Use this command to open an ssh session to a ipv4 address or host name resolved to an ipv4 address.

Command

Syntax `ssh WORD (vrf (NAME | management)) ssh WORD <1-65535> (vrf (NAME | management)) ssh (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc| aes256-cbc | 3des-cbc)) WORD (vrf (NAME | management)) ssh (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc | aes256-cbc | 3des-cbc)) WORD <1-65535> (vrf (NAME | management))`

Parameters

`WORD`	User and Destination Host name to resolve into IPV4 Address or IPv4 Address to open a ssh session as user@ipv4-address/Hostname
`1-65535`	Destination Port to open a ssh session. Default is 22
`cipher`	Specify algorithm to encrypt ssh session
`aes128-ctr`	Advanced Encryption Standard 128 bit Counter Mode
`aes192-ctr`	Advanced Encryption Standard 192 bit Counter Mode
`aes256-ctr`	Advanced Encryption Standard 256 bit Counter Mode
`aes128-cbc`	Advanced Encryption 128 bit Standard Cipher Block Chaining
`aes192-cbc`	Advanced Encryption Standard 192 bit Cipher Block Chaining
`aes256-cbc`	Advanced Encryption Standard 256 bit Cipher Block Chaining
`3des-cbc`	Triple Data Encryption Standard Cipher Block Chaining
`vrf`	Specify the VPN routing/forwarding instance.
`NAME`	Specify the name if the VPN routing/forwarding instance.
`management`	Management VPN routing/forwarding instance name.

Default

By default, ssh WORD option is 22

Command Mode

Privileged Exec mode

Applicability

This command was introduced in version before SWMRE version 1.3.

Examples

```
#ssh cipher aes128-ctr 10.12.16.17 22 vrf management
   The authenticity of host '10.12.16.17 (10.12.16.17)' can't be established.
  RSA key fingerprint is 93:82:98:ce:b7:20:1a:85:a5:9a:2e:93:13:84:ea:9e.
Are you sure you want to continue connecting (yes/no)?
```

ssh6

Use this command to open an ssh session to an ipv6 address or host name resolved to an ipv6 address.

Command Syntax `ssh6 (X:X::X:X | HOSTNAME) (vrf (NAME | management)) ssh6 (X:X::X:X | HOSTNAME) <1-65535> (vrf (NAME | management)) ssh6 (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc | aes256-cbc | 3des-cbc)) (X:X::X:X | HOSTNAME) (vrf (NAME | management))`

```
                                                                    ssh6
    (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc | aes256-
    cbc | 3des-cbc))  (X:X::X:X | HOSTNAME) <1-65535> (vrf (NAME | management))
```

Parameters

X:XX::X:X	User and Destination IPv6 Address to open a ssh session as user@ipv6-address
HOSTNAME	User and Destination Host name to resolve into IPv6 Address to open an ssh session as user@ipv4-address/Hostname
1-65535	Destination Port to open a ssh session. Default is 22
cipher	Specify algorithm to encrypt ssh session
aes128-ctr	Advanced Encryption Standard 128 bit Counter Mode
aes192-ctr	Advanced Encryption Standard 192 bit Counter Mode
aes256-ctr	Advanced Encryption Standard 256 bit Counter Mode
aes128-cbc	Advanced Encryption 128 bit Standard Cipher Block Chaining
aes192-cbc	Advanced Encryption Standard 192 bit Cipher Block Chaining
aes256-cbc	Advanced Encryption Standard 256 bit Cipher Block Chaining
3des-cbc	Triple Data Encryption Standard Cipher Block Chaining
vrf	Specify the VPN routing/forwarding instance.
NAME	Specify the name if the VPN routing/forwarding instance.
management	Management VPN routing/forwarding instance name.

Default

No default value is specified.

Command Mode

Privileged Exec mode

Applicability

This command was introduced in version before SWMRE version 1.3.

Examples

```
        #ssh6 cipher aes128-ctr 2:2::2:2 22 vrf management
        The authenticity of host '2:2::2:2 (2:2::2:2)' can't be established.
          RSA key fingerprint is 93:82:98:ce:b7:20:1a:85:a5:9a:2e:93:13:84:ea:9e.
    Are you sure you want to continue connecting (yes/no)?
```

ssh algorithm encryption

SSH server authorizes connection of only those algorithms that are configured from the list below. If a client tries establishing a connection to the server with the algorithm encryption that are not part of the list, the connection will not established.

SSH server supports the encryption algorithms Advanced Encryption Standard Counter Mode [AES-CTR], Advanced Encryption Standard Cipher Block Chaining [AES-CBC], and Triple Data Encryption Standard [3DES].

and they are as follows:

1. aes128-ctr
2. aes192-ctr
3. aes256-ctr
4. aes128-cbc
5. 3des-cbc
6. aes192-cbc
7. aes256-cbc

Use this command to set an algorithm encryption to establish ssh session.

Use the `no` form of this command to remove an algorithm encryption.

Command Syntax:

```
ssh server algorithm encryption {aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc
|aes192-cbc | aes256-cbc | 3des-cbc} (vrf management|) no ssh server algorithm
encryption {aes128-ctr | aes192-ctr | aes256-ctr | aes128-
cbc |aes192-cbc | aes256-cbc | 3des-cbc} (vrf management|)
```

Parameters

`aes18-ctr`	AES 128 bit Counter Mode
`aes192-ctr`	AES 192 bit Counter Mode
`aes256-ctr`	AES 256 bit Counter Mode
`aes128-cbc`	AES 128 bit Cipher block chaining
`aes192-cbc`	AES 192 bit Cipher block chaining
`aes256-cbc`	AES 256 bit Cipher block chaining
`3des-cbc`	Triple DES Cipher block chaining
`vrf`	Virtual Routing and Forwarding
`NAME`	Virtual Routing and Forwarding name

Default

No default value is specified.

By default, all the ciphers are supported for a new ssh client to connect to the ssh server.

Command Mode

Configure mode

Applicability

This command was introduced in version before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ssh server algorithm encryption aes128-ctr
```

Note: After configuring the ssh server algorithm encryption, if you disable the previous encryption algorithm, the command is rejected, and the following message is displayed:

```
"% There must be at least one session encryption alogirthm."
```

ssh key

Use this command to create a SSH server key.

Use the `no` form of this command remove a SSH server key. The `no ssh key` form (with no other parameters) deletes both RSA and DSA keys.

You can only give this command when the SSH server is disabled. See the feature ssh command.

Command Syntax `ssh key dsa (vrf management|) ssh key dsa force (vrf management|) ssh key rsa (vrf management|) ssh key rsa length <768-2048> (vrf management|) ssh key rsa length <768-2048> force (vrf management|) ssh key rsa force (vrf management|) no ssh key (vrf management|) no ssh key dsa (vrf management|) no ssh key rsa (vrf management|)`

Parameters

`dsa`	Digital System Algorithm (DSA) SSH key
`management`	Virtual Routing and Forwarding name
`force`	Forces the replacement of an SSH key
`rsa`	Rivest, Shamir, and Adelman (RSA) public-key cryptography SSH server key
`<768-2048>`	Number of bits to use when creating the SSH server key; this parameter is only valid for RSA keys (DSA keys have a default length of 1024)

Default

DSA keys have a default value of 1024.

RSA keys have a minimum key length of 768 bits and the default length is 2048.

By default the system has RSA/DSA public/private key pair placed in /etc/ssh/. The force option is used if the user wants to regenerate the ssh rsa keys. The same thing applies for dsa also.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ssh key dsa
```

ssh login-attempts

Use this command to set the number of times that a user can try to log in to a SSH session.

Use the `no` form of this command to set the number of login attempts to its default (3).

You can only give this command when the SSH server is disabled. See the feature ssh command.

Command Syntax `ssh login-attempts RETRIES (vrf management|) no ssh login-attempts (vrf management|)`

Parameters

`RETRIES` Number of retries <1-3> `management` Virtual Routing and Forwarding name

Default

By default, the device attempts to negotiate a connection with the connecting host three times.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ssh login-attempts 3
```

ssh server port

Use this command to set the port number on which the SSH server listens for connections. The default port on which the SSH server listens is 22.

You can only give this command when the SSH server is disabled. See the feature ssh command.

Use the `no` form of this command to set the default port number (22).

Command Syntax `ssh server port <1024-65535> (vrf management|) no ssh server port (vrf management|)`

Parameters

`<1024-65535>` Port number

`management` Virtual Routing and Forwarding name

Default

By default, SSH server port is 22.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ssh server port 1720
```

username sshkey

Use this command to create a user account.

Command Syntax `username USERNAME sshkey LINE`

Parameters

`USERNAME`	User identifier
`LINE`	Digital System Algorithm (DSA) key or Rivest, Shamir, and Adelman (RSA) key in OpenSSH format; this key is written to the `authorized_keys` file

Default

By default, SSHKEY is 1024.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#username fred sshkey
AAAAB3NzaC1kc3MAAAEBAIirweZzCdyITqbMWB8Wly9ivGxY1JBVnWTVtcWKi6uc

```

username keypair

Use this command to create a user account.

Command Syntax `username USERNAME keypair rsa username USERNAME keypair dsa username USERNAME keypair rsa length <768-2048> username USERNAME keypair rsa length <768-2048> force username USERNAME keypair rsa force username USERNAME keypair dsa force`

Parameters

`USERNAME`	User identifier
`rsa`	Rivest, Shamir, and Adelman (RSA) public-key cryptography SSH server key
`dsa`	Digital System Algorithm (DSA) SSH key
`<768-2048>`	Number of bits to use when creating the SSH server key; this parameter is only valid for RSA keys (DSA keys have a default length of 1024)
`force`	Forces the replacement of an SSH key

Default

DSA keys have a default value of 1024.

RSA keys have a minimum key length of 768 bits and the default length is 2048.

By default the system has RSA/DSA public/private key pair placed in /etc/ssh/. The force option is used if the user wants to regenerate the ssh rsa keys. The same thing applies for dsa also.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#username fred keypair rsa
```

CHAPTER 4 Simple Network Management Protocol

This chapter is a reference for Simple Network Management Protocol (SNMP) commands.

SNMP provides a standardized framework and a common language for monitoring and managing devices in a network. The SNMP framework consists of three parts:

- An SNMP manager: The system used to control and monitor the activities of network devices. This is sometimes called a Network Management System (NMS).
- An SNMP agent: The component within a managed device that maintains the data for the device and reports these data SNMP managers.
- Management Information Base (MIB): SNMP exposes management data in the form of variables which describe the system configuration. These variables can be queried (and sometimes set) by SNMP managers.

In SNMP, administration groups are known as *communities*. SNMP communities consist of one agent and one or more SNMP managers. You can assign groups of hosts to SNMP communities for limited security checking of agents and management systems or for administrative purposes. Defining communities provides security by allowing only management systems and agents within the same community to communicate.

A host can belong to multiple communities at the same time, but an agent does not accept a request from a management system outside its list of acceptable community names.

SNMP access rights are organized by groups. Each group is defined with three accesses: read access, write access, and notification access. Each access can be enabled or disabled within each group.

The SNMP v3 security level determines if an SNMP message needs to be protected from disclosure and if the message needs to be authenticated. The security levels are:

- noAuthNoPriv: No authentication or encryption
- authNoPriv: Authentication but no encryption
- authPriv: Both authentication and encryption SNMP is defined in RFCs 3411-3418.

Note: The commands below are supported only on the “management” VRF.

This chapter contains these commands:

- clear snmp hostconfig
- debug snmp-server
- show running-config snmp
- show snmp
- show snmp community
- show snmp engine-id
- show snmp group
- show snmp host
- show snmp user
- show snmp view
- snmp-server community
- snmp-server contact
- snmp-server enable snmp

- snmp-server enable traps
- snmp-server host
- snmp-server location
- snmp-server tcp-session
- snmp-server user
- snmp-server view

clear snmp hostconfig

Use this command to remove all SNMP trap hosts.

Command Syntax `clear snmp hostconfig`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear snmp hostconfig
```

debug snmp-server

Use this command to display SNMP debugging information.

Use the `no` form of this command to stop displaying SNMP debugging information.

Command Syntax `debug snmp-server no debug snmp-server`

Parameters

None

Default

By default, disabled.

Command Mode

Exec and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#debug snmp-server
```

show running-config snmp

Use this command to display the SNMP running configuration.

Command Syntax `show running-config snmp`

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show running-config snmp snmp-server view all .1 included snmp-server
community abc group network-admin snmp-server enable snmp
```

show snmp

Use this command to display the SNMP configuration, including session status, system contact, system location, statistics, communities, and users.

Command Syntax

```
show snmp
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show snmp
SNMP
Protocol:Enabled sys
Contact: sys
Location:

--------------------------------------------------------------------------------
Community Group/Access Context acl_filter
--------------------------------------------------------------------------------
public network-admin
________________________________________________________________________________

                         SNMP USERS
________________________________________________________________________________
User Auth Priv(enforce) Groups
________________________________________________________________________________

SNMP Tcp-session :Disabled
```

show snmp community

Use this command to display SNMP communities.

Command Syntax `show snmp`

```
community
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show snmp community

  ---------------------------------------------------------------------------
Community               Group/Access        view-name        version
  ---------------------------------------------------------------------------
```

show snmp engine-id

Use this command to display the SNMP engine identifier.

The SNMP engine identifier is a unique string used to identify the device for administration purposes. You do not specify an engine identifier for a device; SWMRE generates a default string. For more about the SNMP engine identifier, see RFC 2571.

Command Syntax

```
show
snmp engine-id
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show snmp engine-id
SNMP ENGINE-ID : 80 00 8f 41 03 00 00 00 00 00 00
```

show snmp group

Use this command to display SNMP server groups and associated views.

Command Syntax `show`

```
snmp group
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show snmp group
-------------------------------------------------------------------------------
------------------------------
community/user    group         version   Read-View   Write-view   Notify-view
-------------------------------------------------------------------------------
------------------------------

test          network-operator    2c/1      all          all          all
kedar         network-operator    3         all          none         all
tamil         network-operator     3        all          none         all
```

show snmp host

Use this command to display the SNMP trap hosts.

Command Syntax `show`

```
snmp host
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show snmp host
-------------------------------------------------------------------------
```

```
Host            Port    Version    Level       Type      SecName
-------------------------------------------------------------------------

10.10.26.123    162     2c         noauth      trap      test
```

Table 4-3: Show snmp host output

Entry	Description
Host	The IP address of the SNMP host server.
Port	The port being used for SNMP traffic.
Version	SNMP version number.
Level	The security level being used.
Type	The type of SNMP object being sent.
SecName	Secure Name for this SNMP session.

show snmp user

Use this command to display SNMP users and associated authentication, encryption, and group.

Command Syntax `show snmp`

`user`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show snmp user

SNMP USERS

_____________________________________________________________________
User            Auth     Priv(enforce)     Groups
_____________________________________________________________________
ntwadmin        MD5      AES               network-admin
```

```
#
```

Table 4-4: Show snmp user output

Entry	Description
User	The person attempting to use the SMNMP agent.
Auth	The secure encryption scheme being used.
Priv(enforce)	What enforcement privilege is being used (in this case, it is the Advance Encryption Standard).
Group	The group to which the user belongs.

show snmp view

Use this command to display SNMP views.

Command Syntax `show snmp view`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show snmp view

View : all
  OID : .1
  View-type : included
```

snmp-server community

Use this command to create an SNMP community string and access privileges.

Use the `no` form of this command to remove an SNMP community string.

Command Syntax

```
snmp-server community WORD (| (view VIEW-NAME version (v1 | v2c ) ( ro | rw)) |
(group WORD) |( ro | rw) | (use-acl WORD) ) (vrf management|) no
snmp-server community COMMUNITY-NAME (vrf management|)
```

Parameters

`WORD`	SNMP community string; maximum length 32 characters
`VIEW-NAME`	Defined view that defines the objects available to the SNMP community
`v1`	SNMP v1
`v2c`	SNMP v2c
`ro`	Read-only access
`rw`	Read-write access
`group`	Community group
`WORD`	Community group name; maximum length 32 characters
`ro`	Read-only access
`rw`	Read-write access
`use-acl`	Access control list (ACL) to filter SNMP requests
`WORD`	ACL name; maximum length 32 characters
`management`	Virtual Routing and Forwarding name

Default

No default value specified.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
  (config)#snmp-server community MyComm view MyView1 version v2c rw vrf management
```

snmp-server contact

Use this command to set the system contact information for the device (`sysContact` object).

Use the `no` form of this command to remove the system contact information.

Command Syntax `snmp-server contact (vrf management|) (TEXT|)`

`no snmp-server contact (vrf management|) (TEXT|)`

Parameters `management` Virtual Routing and Forwarding name

`TEXT` System contact information; maximum length 32 characters without spaces

Default

No default value specified.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#snmp-server contact vrf management Irving@555-0150
```

snmp-server enable snmp

Use this command to start the SNMP agent daemon over UDP.

Use the `no` form of this command to stop the SNMP agent daemon over UDP.

Command Syntax `snmp-server enable snmp (vrf management|) no snmp-server enable snmp (vrf management|)`

Parameters `management` Virtual Routing and Forwarding name

Default

No default value specified.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#snmp-server enable snmp vrf management
```

snmp-server enable traps

Use this command to enable or disable SNMP traps and inform requests.

Command Syntax

```
snmp-server enable traps (link(linkDown|linkUp|)|snmp(authentication|)|) (vrf
  management|)

no snmp-server enable traps ((link(linkDown|linkUp|))|(snmp(authentication|))|)
  (vrf management|)
```

Parameters

`link`	Module notifications enable
`linkDown`	IETF Link state down notification
`linkUp`	IETF Link state up notification
`snmp`	Enable RFC 1157 notifications
`authentication`	Send SNMP authentication failure notifications
`management`	Virtual Routing and Forwarding name

Default

By default, snmp server enable traps is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#snmp-server enable traps vrf management
```

snmp-server host

Use this command to configure an SNMP trap host. An SNMP trap host is usually a network management station (NMS) or an SNMP manager.

Use the `no` form of this command to remove an SNMP trap host.

Command Syntax

IPv4/SNMP v2:

```
snmp-server host (A.B.C.D|HOSTNAME) (traps | informs) version ((1
  | v2c) WORD) (|udp-port <1-65535>) (vrf management|)
```

IPv4/SNMP v3:

```
snmp-server host (A.B.C.D|HOSTNAME) (traps | informs)
  version(( (1 | 2c) WORD | (3 (noauth | auth | priv) WORD)) (|udp-port <1-65535>)
   (vrf management|)
```

Parameters

A.B.C.D	IPv4 address
HOSTNAME	DNS host name
traps	Send notifications as traps
informs	Send notifications as informs
version	Version
v1	SNMP v1
1	SNMP v1
v2c	SNMP v2c
2c	SNMP v2c
WORD	SNMP community string
<1-65535>	Host UDP port number; the default is 162
management	Virtual Routing and Forwarding name
3	SNMP v3 security level
noauth	No authentication and no privacy (noAuthNoPriv) security model: messages transmitted as clear text providing backwards compatibility with earlier versions of SNMP
auth	Authentication and no privacy (authNoPriv) security model: use message digest algorithm 5 (MD5) or Secure Hash Algorithm (SHA) for packet authentication; messages transmitted in clear text
priv	Authentication and privacy (authPriv) security model: use authNoPriv packet authentication with Data Encryption Standard (DES) Advanced Encryption Standard (AES) for packet encryption
WORD	SNMPv3 user name

Default

The default SNMP version is v2c and the default UDP port is 162.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#snmp-server host 10.10.10.10 traps version 3 auth MyUser udp-port 512 vrf
management
```

snmp-server location

Use this command to set the physical location information of the device (`sysLocation` object).

Use the `no` form of this command to remove the system location information.

Command Syntax `snmp-server location (vrf management|) (LINE|)`

`no snmp-server location (vrf management|) (LINE|)`

Parameters `management` Virtual Routing and Forwarding name `LINE` Physical location information

Default

No system location string is set.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
          (config)#snmp-server location vrf management Bldg. 5, 3rd floor, northeast
```

snmp-server tcp-session

Use this command to start the SNMP agent daemon over TCP.

Use the `no` form of this command to close the SNMP agent daemon over TCP.

Command Syntax `snmp-server tcp-session (vrf management|) no snmp-server tcp-session (vrf management|)`

Parameters `management` Virtual Routing and Forwarding name

Default

By default, snmp server tcp session is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#snmp-server tcp-session vrf management
```

snmp-server user

Use this command to create an SNMP server user.

Use the `no` form of this command to remove an SNMP server user.

Command Syntax

```
snmp-server user WORD (|WORD) ((auth (md5 | sha ) AUTH-PASSWORD) ((priv (des | aes)
 PRIV-PASSWORD) |) |) (vrf management|) no snmp-
server user USER-NAME (vrf management|)
```

Parameters

`WORD`	User name; length 5-32 characters
`WORD`	Name of the group to which the user belongs; maximum length 35 characters
`auth`	Packet authentication type
`md5`	Message Digest Algorithm 5 (MD5)
`sha`	Secure Hash Algorithm (SHA)
`AUTH-PASSWORD`	Authentication password; length 8-32 characters
`priv`	Packet encryption type (“privacy”)
`des`	Data Encryption Standard (DES)
`aes`	Advanced Encryption Standard (AES)
`PRIV-PASSWORD`	Encryption password; length 8-33 characters
`management`	Virtual Routing and Forwarding name

Default

By default, snmp server user word is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#snmp-server user Fred auth md5 J@u-b;l2e`n,9p_ priv des t41VVb99i8He{Jt vrf
management
```

snmp-server view

Use this command to create or update a view entry

Use the `no` from of this command to remove a view entry.

Command Syntax `snmp-server view VIEW-NAME OID-TREE (included | excluded) (vrf management|) no snmp-server view VIEW-NAME (vrf management|)`

Parameters

`VIEW-NAME`	View name; maximum length 32 characters
`OID-TREE`	Object identifier of a subtree to include or exclude from the view; specify a text string consisting of numbers and periods, such as 1.3.6.2.4
`included`	Include `OID-TREE` in the SNMP view
`excluded`	Exclude `OID-TREE` from the SNMP view
`management`	Virtual Routing and Forwarding name

Default

By default, snmp-server view VIEW-NAME OID-TREE `is` disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following example creates a view named `myView3` that excludes the `snmpCommunityMIB` object (1.3.6.1.6.3.18).

```
#configure terminal
(config)#snmp-server view myView3 1.3.6.1.6.3.18 excluded vrf management
```

CHAPTER 5 Telnet

This chapter describes telnet commands.

Telnet is a client/server protocol that establishes a session between a user terminal and a remote host:

- The telnet client software takes input from the user and sends it to the server's operating system
- The telnet server takes output from the host and sends it to the client to display to the user

While telnet is most often used to implement remote login capability, the protocol is general enough to allow it to be used for a variety of functions.

Note: The commands below are supported only on the "management" VRF.

This chapter contains these commands:

- debug telnet server
- feature telnet
- show debug telnet-server
- show running-config telnet server
- show telnet-server
- telnet
- telnet6
- telnet server port

debug telnet server

Use this command to display telnet debugging information.

Use the `no` form of this command to stop displaying telnet debugging information.

Command Syntax `debug telnet server no debug telnet server`

Parameters

None

Default

By default, disabled.

Command Mode

Executive mode and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show debug telnet-server

telnet server debugging is on
#
```

feature telnet

Use this command to enable the telnet server.

Use the `no` form of this command to disable the telnet server.

Command Syntax `feature telnet (vrf management|) no feature telnet (vrf management|)`

Parameters `management` Virtual Routing and Forwarding name

Default

By default, feature telnet is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
                    (config)#feature telnet vrf management
```

show debug telnet-server

Use this command to display whether telnet debugging is enabled.

Command Syntax `show debug telnet-server`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show debug telnet-server
```

show running-config telnet server

Use this command to display telnet settings in the running configuration.

Command Syntax `show running-config telnet server`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show running-config telnet server feature telnet
```

show telnet-server

Use this command to display the telnet server status.

Command Syntax `show telnet server`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show telnet server telnet server enabled port: 23
```

telnet

Use this command to open a telnet session to an ipv4 address or host name resolved to ipv4 address.

Command Syntax `telnet (A.B.C.D | HOSTNAME) (vrf (NAME|management))` `telnet (A.B.C.D | HOSTNAME) (<1-65535>) (vrf (NAME|management))`

Parameters

`A.B.C.D`	Destination IPv4 Address to open a telnet session.
`HOSTNAME`	Destination Hostname to resolve into IPv4 address to open a telnet session.
`1-65535`	Destination Port to open a telnet session. Default is 23.
`vrf`	Specify the VPN routing/forwarding instance.
`NAME`	Specify the name if the VPN routing/forwarding instance.
`management`	Management VPN routing/forwarding instance name.

Default

By default, telnet is 23

Command Mode

Privileged Exec mode

Applicability

This command was introduced in version before SWMRE version 1.3.1.

Examples

```
#telnet 10.12.16.17 2543 vrf management Trying 10.12.16.17...
```

telnet6

Use this command to open a telnet session to an ipv6 address or host name resolved to ipv6 address.

Command Syntax `telnet6 (X:X::X:X| HOSTNAME) (vrf (NAME|management)) telnet6 (X:X::X:X | HOSTNAME) (<1-65535>) (vrf (NAME|management))`

Parameters

`X:X::X:X`	Destination IPv6 Address to open a telnet session.
`HOSTNAME`	Destination Host name to resolve into IPv6 address to open a telnet session.
`1-65535`	Destination Port to open a telnet session. Default is 23.
`vrf`	Specify the VPN routing/forwarding instance.
`NAME`	Specify the name if the VPN routing/forwarding instance.
`management`	Management VPN routing/forwarding instance name.

Default

By default, telnet is 23.

Command Mode

Privileged Exec mode

Applicability

This command was introduced in version before SWMRE version 1.3.1.

Examples

```
#telnet6 2:2::2:2 2543 vrf management Trying
2:2::2:2...
```

telnet server port

Use this command to set the port number on which the telnet server listens for connections. The default port on which the telnet server listens is 23.

You can only give this command when the telnet server is disabled. See the feature telnet command.

Use the `no` form of this command to set the default port number (23).

Command Syntax `telnet server (port <1024-65535>) (vrf management|) no telnet server port (vrf management|)`

Parameters

`<1024-65535>`	Port number
`management`	Virtual Routing and Forwarding name

Default

By default, telnet server port number is 23

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#telnet server port 1157 vrf management
```

© Symanitron

CHAPTER 6 Syslog

This chapter is a reference for the `syslog` commands.

Linux applications use the `syslog` utility to collect, identify, time-stamp, filter, store, alert, and forward logging data. The `syslog` utility can track and log all manner of system messages from informational to extremely critical. Each system message sent to a `syslog` server has two descriptive labels associated with it:

- The function (facility) of the application that generated it. For example, an application such as `mail` and `cron` generates messages with a facility names “mail” and “cron”.
- Eight degrees of severity (numbered 0-7) of the message which are explained in Table 6-5.

This chapter contains these commands:

- feature rsyslog
- debug logging
- log syslog
- logging console
- logging level
- logging logfile
- logging monitor
- logging server
- logging timestamp
- show logging
- show logging last
- show logging logfile
- show logging logfile last-index
- show logging logfile start-seqn end-seqn
- show logging logfile start-time end-time
- show running-config logging

Syslog Severities

Table 6-5: Syslog severities (Sheet 1 of 2)

Severity Level	Keyword	Description

0	emergency	The whole system is unusable and needs operator intervention to recover. If only a particular port or component is unusable, but the system as a whole is still usable it is not categorized at an emergency level.
		Examples of this type of message:
		`Output Power of PSU XX (psu_no) XX Watt] has exceeded Maximum Output Power Limit[XX Watt]`
		`OSPF Initialization failed.`

1	alert	The operator needs to act immediately or the system might go into emergency state. The system or one of its component's functionality might be critically affected. Examples of this type of message:
		`Temperature of sensor is (curr_temp)C. It is nearing Emergency Condition.`
		`OSPF has exceed lsdb limit`
		`OSPF Detected router with duplicate router ID [ID]`

2	critical	A critical system event happened which requires the operator's attention. The event might not require immediate action, but this event can affect functionality or behavior of a system component. Examples of this type of message:
		`OSPF Neighbor session went down.`
		`Interface %s changed state to down`

3	error	An error event happened which does not require immediate attention. This log message provides details about error conditions in the system or its components which you can use to troubleshoot problems.
		These events are not logged directly even if the logging level is set to include this level. You also need to enable the protocol debug filters (such as `debug ospf all`). Examples of this type of message:
		`Device i2c bus open error.!!!`
		`[DECODE] Attr ASPATH: Invalid AS Path value.`
		`OSPF MD5 authentication error`

4	notification	Notifications about important system and protocol events to assure the operator that the system is running properly. If a critical/alert condition has happened and has been corrected, that is also logged at this level.
		Warning messages are also logged in this level.
		These events are not logged directly even if the logging level is set to include this level. You also need to enable the protocol debug filters (such as `debug ospf all`). Examples of this type of message:
		`OSPF Received link up for interface: xe1`
		`OSPF neighbour [10.1.1.1] Status change Exstart -> Exchange`
		`Interface %s changed state to UP`

Table 6-5: Syslog severities (Sheet 2 of 2)

Severity Level	Keyword	Description

5	informational	Detailed informational events happening across the system and protocol modules. These events are not necessarily important and are useful only to find details about the functionality being executed in the system and its components. Some of these events might be periodic events like hello or keep alive messages along with packet dumps. Also, this level includes logs for control packets that are ignored and do not impact the protocol states.
		Symanitron recommends to use proper debug filters to log only relevant events and switch off other events; otherwise the logs can get verbose. For example: `debug ospf all`
		`no debug ospf packet hello`
		The above enables all OSPF debugging, but disables the periodic hello messages.
		Examples of this type of message:
		`Successfully added dynamic neighbour`
		`[DECODE] KAlive: Received!`
		`[FSM] Ignoring Unsupported event <EVENT> in state <STATE>`
		`Unknown ICMP packet type"`
		`OSPF RECV[%s]: From %r via %s: Version number mismatch`
		`OSPF RECV[%s]: From %r via %s: Network address mismatch`

6	debug informational	Developer notification events that might not be readable by an operator. However these logs are useful for debugging by a developer and if required, this level needs to be enabled and provided to technical support for analysis.
7	debug detailed	Developer notification events that might not be readable by an operator. However these logs are useful for debugging by a developer and if required, this level needs to be enabled and provided to technical support for analysis.

Log File Rotation

SWMRE rotates `/var/log/message` every three hours. When the log file is 100 megabytes or more, the current log file is backed up and a new log file is started. With four rotations, there can be four backup log files and one current log file.

feature rsyslog

Use this command to enable the rsyslog server.

Use the `no` form of this command to disable the rsyslog server.

Command Syntax `feature rsyslog vrf (management|) no feauture rsyslog vrf (management|)`

Parameters `management` Virtual Routing and Forwarding name

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.5

Example

```
#configure terminal
                    (config)#feature rsyslog vrf management
```

debug logging

Use this command to display logging debugging information.

Use the `no` form of this command stop displaying logging debugging information.

Command Syntax `debug logging host no  debug logging host`

Parameters

None

Command Mode

Exec and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#debug logging host
```

log syslog

Use this command to begin logging to the system log and set the level to debug.

Syslog enables centrally logging and analyzing of configuration events and system error messages. This helps monitor interface status, security alerts, and CPU process overloads. It also allows real-time capturing of client debug sessions. The command instructs the `VLOGD` daemon to forward all PVR debug output from all active `terminal monitor` sessions to the syslog file.

Use the `no` parameter to disable logging to the system log.

Command Syntax

```
log syslog no
log syslog
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#log syslog
```

logging console

Use this command to set the severity level that a message must reach before the messages is sent to the console. The severity levels are from 0 to 7 as shown in Table 6-5.

Use the `no` form of this command to disable logging console messages.

Note: Below message will be displayed if console severity is set to 6 or 7:

% Warning : If debug volume is huge it can degrade system performance and makes console to be nonresponsive

Command Syntax `logging`

```
console (<0-7>|) no
logging console
```

Parameters

`<0-7>`	Maximum logging level for console messages as shown in Table 6-5.

Note: Setting the level above 5 might affect performance and is not recommended in a production network.

Default

If not specified, the default logging level is 2 (Critical).

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#logging console 6

(config)#2015 Dec 23 03:13:26 SWMRE    BGP-6: [RIB] Scanning BGP Network Route
s...
2015 Dec 23 03:13:41 SWMRE BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:13:56 SWMRE BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:14:00 SWMRE BGP-6: [RIB] Scanning BGP RIB...
2015 Dec 23 03:14:11 SWMRE BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:14:26 SWMRE BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:14:41 SWMRE BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:14:56 SWMRE BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:15:00 SWMRE BGP-6: [RIB] Scanning BGP RIB...

(config)#no logging console
```

logging level

Use this command to set the severity level that a message for a specific process must reach before the messages is logged. The severity levels are from 0 to 7 as shown in Table 6-5. Logging happens for the messages less than or equal to the configured severity level.

Use the `no` form of this command to disable logging messages.

Note: SWMRE shell takes level of CMLD module. Any updates in severity of CMLD will be taken into effect for the next SWMRE session.

Command Syntax

```
logging level (all|auth|bgp|dvmrp|hostp|hsl|isis|l2mrib|lacp|lagd|ldp|mrib|
  mstp|ndd|nsm|onm|oam|ospf|ospf6|pim|pservd|ptp|rib|rip|ripng|rmon|rsvp|sflow
  | trill|vrrp) <0-7>

no logging level (all|auth|bgp|dvmrp|hostp|hsl|isis|l2mrib|lacp|lagd|ldp|mrib|
  mstp|ndd|nsm|oam|onm|ospf|ospf6|pim|pservd|ptp|rib|rip|ripng|rmon|rsvp|sflow
  | trill|vrrp)
```

Parameters

`all`	All messages

`auth`	Auth messages
`bgp`	BGP messages
`dvmrp`	DVMRP messages
`hostp`	Hostp messages
`hsl`	HSL messages
`isis`	ISIS messages
`l2mrib`	L2MRIB messages
`lacp`	LACP messages
`lagd`	LAGD messages
`ldp`	LDP messages
`mrib`	MRIB messages
`mstp`	MSTP messages
`ndd`	NDD messages
`nsm`	NSM messages
`oam`	OAM messages
`onm`	ONM messages
`ospf`	OSPF messages
`ospf6`	OSPF6 messages
`pim`	PIM messages
`pservd`	PSERVD messages
`ptp`	PTP messages
`rib`	RIB messages
`rip`	RIP messages
`ripng`	RIPNG messages
`rmon`	RMON messages
`rsvp`	RSVP messages
`sflow`	Sflow messages
`trill`	TRILL messages
`vrrp`	VRRP messages
`<0-7>`	Severity level as shown in Table 6-5.

Default

By default, logging monitor is 2 (critical).

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#logging level all 5

#configure terminal
(config)#logging level bgp 6

(config)#no logging monitor
```

logging logfile

Use this command to specify the log file controls and where to save the logs in a configuration file. This command enables writing debug output and command history to the disk file in the directory `/log/`.

When logging logfile is enabled, SWMRE log information is stored in user configured logging file which is present in "/log" directory. The log is spread across four files total of these files size is the user configured size.

For example, if the name of the logging log file is “mylogFile” and logging file size configured is 4 MB then each file will be maximum size of 1MB. The logging file names will be "mylogFile", "mylogfile.0", "mylogfile.1" and "mylogfile.2".

"mylogFile" will have the latest log information. As soon as it’s size becomes 1 MB this file is renamed as mylogFile.0 and newlog information is written to new "mylogFile". As a result oldest log information stored in mylogfile.2 and is lost in order to accommodate new set of logs in mylogFile.

Use option no to cancel writing to a specific log file.

Note:Changing logfile paramenters (name/size/severity) will be taken into effect for the next SWMRE session.

Command Syntax `logging logfile LOGFILENAME <0-7> ((size <4096-4194304>)|) no logging logfile`

Parameter

`LOGFILENAME`	Name of the log file.
`<0-7>`	Severity level as shown in Table 6-5.
`<4096-4194304>`	Log file size in bytes.

Default

By default, log file size is 4194304 bytes.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

This command is used to log the debug messages of a particular protocol daemon to the specified file.

```
#configure terminal
(config)#logging logfile test123 7
```

logging monitor

Use this command to set the severity level that a message must reach before a monitor message is logged. The severity levels are shown in Table 6-5.

Use the `no` parameter to disable logging monitor messages.

Command Syntax `logging monitor`

```
(<0-7>|) no logging monitor
```

Parameters

`<0-7>` Maximum logging level for monitor messages as shown in Table 6-5.

Note: Setting the level above 5 might affect performance and is not recommended in a production network.

Default

If not specified, the default logging level is 3 (error).

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#logging monitor 6

(config)#no logging monitor
```

logging server

Use this command to set a syslog server.

SWMRE supports logging messages to a syslog server in addition to logging to a file or the console (local or ssh/telnet console). SWMRE messages can be logged to a local syslog server (the machine on which SWMRE executes) as well as to one or more remote syslog servers.

Use the `no` form of this command to remove a syslog server.

Command Syntax

```
logging server (A.B.C.D|HOSTNAME) (|((<0-7>) (|facility (local0| local1 | local2 |
  local3| local4 |local5 | local6 | local7 |user)))) (vrf management|)
no logging server (A.B.C.D | HOSTNAME ) (vrf management|)
```

Parameters

A.B.C.D	IPv4 address
HOSTNAME	Host name; specify localhost to log locally
<0-7>	Severity at which messages are logged as shown in Table 6-5. If not specified, the default is 3.
facility	Entity logging the message (user defined); if not specified, the default is local7
local0	Local0 entity
local1	Local1 entity
local2	Local2 entity
local3	Local3 entity
local4	Local4 entity
local5	Local5 entity
local6	Local6 entity
local7	Local7 entity (default)
user	User entity
management	Virtual Routing and Forwarding name

Default

If not specified, the default severity at which messages are logged is 3 (error).

If not specified, the default facility is local7.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
    #configure terminal
(config)#logging server MyLogHost vrf management
```

logging timestamp

Use this command to set the logging timestamp granularity.

Use the `no` form of this command to reset the logging timestamp granularity to its default (milliseconds).

Note: Any change in timestamp configurations will result in timestamp configured for event logged by protocol modules except for CLI history for the current and active sessions. The timestamp configuration is reflected in CLI history for new CLI sessions.

Changing logging timestamp will be taken into effect for the next SWMRE session.

Command Syntax `logging timestamp (microseconds|milliseconds|seconds)` `no logging timestamp`

Parameters `microseconds` Microseconds granularity `milliseconds` Milliseconds granularity `seconds` Seconds granularity

Default

By default, logging time stamp granularity is milliseconds.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#logging timestamp milliseconds
```

show logging

Use this command to display the logging configuration.

Command Syntax `show logging (info|level|server|console|timestamp|monitor)`

Parameters

`info`	Show server logging configuration
`level`	Show facility logging configuration
`server`	Syslog server configuration
`console`	Console configuration
`timestamp`	Timestamp configuration
`monitor`	Monitor configuration

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show logging console
Console logging     : enabled Severity: Operator (critical) Level : 2

#show logging monitor
Logging monitor     : enabled Severity: Operator (debugging) Level: 7

#show logging server
  Remote Servers:

ripngd                    2                         2 ospfd                   2
2 ospf6d                    2                         2 isisd                     2
2 hostpd                    2                         2 mribd                     2
2 pimd                      2                         2 authd                     2
2 mstpd                     2                         2 onmd                      2
2 HSL                       2                         2 oamd                      2
2 vlogd                     2                         2 vrrpd                     2
2 ndd                       2                         2 ribd                      2
2 bgpd                      2                         2 l2mribd                   2
2 hslrasmgr                 2                         2 lagd                      2
2 pservd                    2                         2 cmmd                      2
2
```

show logging last

Use this command to display lines from the end of the log file.

Command Syntax `show logging last`

`(<1-9999>)`

Parameters

`<1-9999>`	Number of lines to display from end of the log file

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show logging last 100
2016 Mar 03 00:02:32 x86_64-debian NSM-3: AgentX: failed to send open message:
Connection refused
2016 Mar 03 00:02:33 x86_64-debian OSPF-3: AgentX: failed to send open message:
Connection refused
2016 Mar 03 00:02:33 x86_64-debian OSPFv3-3: AgentX: failed to send open message:
Connection refused
2016 Mar 03 00:02:33 x86_64-debian IS-IS-3: AgentX: failed to send open message:
Connection refused
2016 Mar 03 00:02:33 x86_64-debian BGP-3: AgentX: failed to send open message:
Connection refused
2016 Mar 03 00:02:33 x86_64-debian RIP-3: AgentX: failed to send open message:
Connection refused
```

show logging logfile

Use this command to display whether logging is enabled, the log file name, and the logging severity.

Command Syntax `show logging logfile`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#sh logging logfile
File logging          : enabled   File Name    : /log/abc   Severity    : (7) 2017 Sep 25

2017 Sep 25 17:29:02 : SWMRE : CMLSH : CLI_HIST : User root@/dev/ttyS1 : CLI : ' sh
logging console
```

show logging logfile last-index

Use this command to display the number of line in the log file.

Command Syntax `show logging logfile last-index`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show logging logfile last-index
```

show logging logfile start-seqn end-seqn

Use this command to display a range of lines in the log file.

Command Syntax `show logging logfile start-seqn (<0-2147483647>) (|(end-seqn <0-2147483647>))` **Parameters**

`start-seqn`	Starting line number
`end-seqn`	Ending line number

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show logging logfile start-seqn 500 end-seqn 750
```

show logging logfile start-time end-time

Use this command to display lines from the log file within a given date-time range.

Command Syntax

```
show logging logfile start-time (<2000-2030> WORD <1-31> WORD) (|(end-time
  <20002030> WORD <1-31> WORD))
```

Parameters `start-time` Starting date and time:

`<2000-2030>` Year in YYYY format

`WORD` Month as `jan`, `feb`, `mar`,..., `oct`, `nov`, or `dec` (maximum length 3 characters)

`<1-31>` Day of month in DD format

`WORD` Hour, minutes, seconds in HH:MM:SS format (maximum length 8 characters); range <0-23>:<0-59>:<0-59>

`end-time` Ending date and time:

`<2000-2030>` Year in YYYY format

`WORD` Month as `jan`, `feb`, `mar`,..., `oct`, `nov`, or `dec` (maximum length 3 characters)

`<1-31>` Day of month in DD format

`WORD` Hour, minutes, seconds in HH:MM:SS format (maximum length 8 characters); range <023>:<0-59>:<0-59>

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show logging logfile start-time 2015 mar 15 12:10:00 end-time 2015 apr 15
12:10:00
```

show running-config logging

Use this command to display the logging configuration.

Command Syntax `show running-config logging`

Parameters

None

Command Mode

Exec mode and Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show running-config logging no Logging console no Logging monitor logging
timestamp milliseconds
```

CHAPTER 7 User Management

This chapter is a reference for user management commands.

This chapter includes these commands:

- clear aaa local user lockout username
- debug user-mgmt
- show user-account
- username

clear aaa local user lockout username

Use this command to unlock the locked user due to three times wrong password login attempt.

Command Syntax `clear aaa local user lockout username USERNAME`

Parameters

`USERNAME`	User name; length 2-15 characters

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear aaa local user lockout username testuser
```

debug user-mgmt

Use this command to display user management debugging information.

Use the `no` form of this command stop displaying user management debugging information.

Command Syntax `debug user-mgmt no debug user-mgmt`

Parameters

None

Default

By default, disabled.

Command Mode

Exec mode and Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#debug user-mgmt

#config t
(config)#debug user-mgmt
```

show user-account

Use this command to display information about all users or a given user.

Command Syntax `show user-account (WORD|)`

Parameters

`WORD`	User name

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show user-account User:user1
                roles: network-operator User:user2
                roles: network-operator User:user3
                roles: network-operator
```

username

Use this command to add a user or to change a user password.

The `role` parameter maps to privilege levels in the TACACS+ server as shown in Table 7-6

Table 7-6: Role/privilege level mapping

Role	Privilege level
Network administrator	15
Network engineer	14
Network operator	1 to 13
Network user	0 or greater then 15

Use the `no` form of this command to remove a user.

Command Syntax `username USERNAME username USERNAME password (encrypted|) PASSWORD`

```
username USERNAME role (network-admin|network-engineer|network-
operator|networkuser)
 username USERNAME role (network-admin|network-engineer|network-
  operator|network-user) password (encrypted|) PASSWORD
no username USERNAME
```

Parameters

`USERNAME` User name; length 2-15 characters

`encrypted` Password is encrypted

`PASSWORD` Password; length 5-32 characters

`network-admin` Network administrator role with all access permissions that can make permanent changes to the configuration. Changes persist after a reset/reboot of the switch.

Only network administrators can manage other users with the enable password, Authentication, Authorization and Accounting, RADIUS, and TACACS+ commands.

`network-engineer`

Network engineer role with all access permission that can make permanent changes to the configuration. Changes persist after a reset/reboot of the switch.

`network-operator`

Network operator role with all access permissions that can make temporary changes to the configuration. Changes do not persist after a reset/reboot of the switch.

`network-user` Network user role with access permissions to display the configuration, but cannot change the configuration.

Default

By default, user name is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
          (config)#username fred_smith password encrypted W3g7y&6yV}JH6&5EYIah?779IT9iV2
```

© Symanitron

CHAPTER 8 Network Time Protocol

This chapter is a reference for Network Time Protocol (NTP) commands.

NTP synchronizes clocks between computer systems over packet-switched networks. NTP can synchronize all participating computers to within a few milliseconds of Coordinated Universal Time (UTC).

NTP uses a hierarchical, layered system of time sources. Each level of this hierarchy is called a “stratum” and is assigned a number starting with zero at the top. The number represents the distance from the reference clock and is used to prevent cyclical dependencies in the hierarchy.

Note: The commands below are supported only on the “management” VRF.

This chapter contains these commands:

- clear ntp statistics
- debug ntp
- feature ntp
- ntp authenticate
- ntp authentication-key
- ntp enable
- ntp logging
- ntp peer
- ntp server
- ntp trusted-key
- show ntp authentication-keys
- show ntp authentication-status
- show ntp logging-status
- show ntp peer-status
- show ntp peers
- show ntp statistics

- show ntp trusted-keys
- show running-config ntp

clear ntp statistics

Use this command to reset NTP statistics.

Command Syntax `clear ntp statistics (all-peers | io | local | memory)`

Parameters

`all-peers`	Counters associated with all peers
`io`	Counters maintained in the input-output module
`local`	Counters maintained in the local protocol module
`memory`	Counters related to memory allocation

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear ntp statistics all-peers
```

debug ntp

Use this command to display NTP debugging messages.

Use the `no` form of this command to stop displaying NTP debugging messages.

Command Syntax `debug ntp no debug ntp`

Parameters

None

Command Mode

Exec mode and Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal (config)#debug ntp

(config)#no debug ntp
```

feature ntp

Use this command to enable NTP.

Use the `no` form of this command to disable NTP.

Command Syntax `feature ntp (vrf management|) no feature ntp (vrf management|)`

Parameters `management` Virtual Routing and Forwarding name

Default

By default, feature ntp is enabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#feature ntp vrf management
```

```
(config)#no feature ntp vrf management
```

ntp authenticate

Use this command to enable NTP authentication.

Use the `no` form of this command to disable authentication.

Command Syntax `ntp authenticate (vrf management|) no ntp authenticate (vrf management|)`

Parameters `management` Virtual Routing and Forwarding name

Default

By default, ntp authenticate is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
                    (config)#ntp authenticate vrf management
```

ntp authentication-key

Use this command to set an NTP Message Digest Algorithm 5 (MD5) authentication key.

Use the `no` form of this command to delete an authentication key.

Command Syntax `ntp authentication-key <1-65534> md5 WORD (vrf management|) ntp authentication-key <1-65534> md5 WORD 7 (vrf management|) no ntp authentication-key <1-65534> md5 WORD (vrf management|)`

Parameters

`<1-65534>`	Authentication key number
`WORD`	MD5 string (maximum 8 characters)
`7`	Encrypt using weak algorithm
`management`	Virtual Routing and Forwarding name

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
                    (config)#ntp authentication-key 535 md5 J@u-b;l2 vrf management
```

ntp enable

Use this command to enable NTP.

Use the `no` form of this command to disable NTP.

Command Syntax `ntp enable (vrf management|) no ntp enable (vrf management|)`

Parameters `management` Virtual Routing and Forwarding name

Default

By default, ntp is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#ntp enable vrf management
```

ntp logging

Use this command to log NTP events.

Use the `no` form of this command to disable NTP logging.

Command Syntax `ntp logging (vrf management|) no ntp logging (vrf management|)`

Parameters `management` Virtual Routing and Forwarding name

Default

By default, ntp logging message is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#ntp logging vrf management
```

ntp peer

Use this command to configure a peer association. In a peer association, this system can synchronize with the other system or the other system can synchronize with this system.

Use the `no` command to remove a peer association.

Command Syntax

```
ntp peer (A.B.C.D | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-
  16>}|) (vrf management|) ntp peer (A.B.C.D | X:X::X:X | HOSTNAME)
({prefer|key <1-65534>|minpoll <4-
  16>|maxpoll <4-16>}|) (vrf management|) no ntp peer (A.B.C.D | HOSTNAME)
({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-
  16>}|) (vrf management|) no ntp peer (A.B.C.D | HOSTNAME)
({prefer|key|minpoll|maxpoll}|) (vrf management|) no ntp peer (A.B.C.D
| X:X::X:X | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-
  16>|maxpoll <4-16>}|) (vrf management|) no ntp peer (A.B.C.D | X:X::X:X |
HOSTNAME) ({prefer|key|minpoll|maxpoll}|) (vrf
  management|)
```

Parameters

`A.B.C.D`	IPv4 address of peer
`HOSTNAME`	Host name of peer
`X:X::X:X`	IPv6 address of peer
`prefer`	Prefer this peer; preferred peer responses are discarded only if they vary dramatically from other time sources
`key`	Peer authentication key
`<1-65534>`	Peer authentication key value
`minpoll`	Minimum poll interval
`<4-16>`	Minimum poll interval value in seconds raised to a power of 2 (default 4 = 16 seconds)
`maxpoll`	Maximum poll interval
`<4-16>`	Maximum poll interval value in seconds raised to a power of 2 (default 6 = 64 seconds)
`management`	Virtual Routing and Forwarding name

Default

By default, value of `minpoll` is 4 and `maxpoll` is 6.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ntp peer 10.10.0.23 vrf management
                    (config)#ntp peer 10.10.0.23 prefer key 12345 vrf management

(config)#no ntp peer 10.10.0.23 vrf management
```

ntp

server

Use this command to configure an NTP server so that this system synchronizes with the server, but not vice versa.

Use the `no` option with this command to remove an NTP server.

Command Syntax

```
ntp server (A.B.C.D | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-
  16>}|) (vrf management|) ntp server (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key
<1-65534>|minpoll <4-
  16>|maxpoll <4-16>}|) (vrf management|) no ntp server (A.B.C.D | HOSTNAME)
({prefer|key <1-65534>|minpoll <4-16>|maxpoll
  <4-16>}|) (vrf management|) no ntp server (A.B.C.D | HOSTNAME)
({prefer|key|minpoll|maxpoll}|) (vrf
  management|)
no ntp server (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-
  16>|maxpoll <4-16>}|) (vrf management|) no ntp server (A.B.C.D | HOSTNAME)
({prefer|key|minpoll|maxpoll}|) (vrf
  management|)
```

Parameters

`A.B.C.D`	IPv4 address of the server
`HOSTNAME`	Host name of the server
`X:X::X:X`	IPv6 address of the server
`prefer`	Prefer this server; preferred server responses are discarded only if they vary dramatically from other time sources
`key`	Server authentication key
`<1-65534>`	Server authentication key
`minpoll`	Minimum poll interval
`<4-16>`	Minimum poll interval value in seconds raised to a power of 2 (default 4 = 16 seconds)
`maxpoll`	Maximum poll interval
`<4-16>`	Maximum poll interval value in seconds raised to a power of 2 (default 6 = 64 seconds)
`management`	Virtual Routing and Forwarding name

Default

By default, `minpoll` is 4 and `maxpoll` is 6.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ntp server 10.10.0.23 vrf management
                    (config)#ntp server 10.10.0.23 prefer key 12345 vrf management

(config)#no ntp server 10.10.0.23 vrf management
```

ntp

sync-retry

Use this command to retry NTP synchronization with configured servers.

Command Syntax `ntp sync-retry (vrf management|)`

Parameters `management` Virtual Routing and Forwarding name

Default

No default value is specified

Command Mode

Exec mode Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#ntp sync-retry vrf management
```

ntp trusted-key

Use this command to define a “trusted” authentication key. If a key is trusted, the device will synchronize with a system that specifies this key in its NTP packets.

Use the `no` option with this command to remove a trusted key.

Command Syntax `ntp trusted-key <1-65534> (vrf management|) no ntp trusted-key <1-65534> (vrf management|)`

Parameter

`<1-65534>` Authentication key number `management` Virtual Routing and Forwarding name

Default

By default, ntp trusted key is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#ntp trusted-key 234676 vrf management
```

show ntp authentication-keys

Use this command to display authentication keys.

Command Syntax `show ntp authentication-keys`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ntp authentication-keys
--------------------------
 Auth Key       MD5 String
```

```
--------------------------
14                SWWX
```

Table 8-7 explains the output fields.

Table 8-7: show ntp authentication-key fields

Entry	Description
Auth key	Authentication key (password). Use the password to verify the authenticity of packets sent from this interface or peer interface.
MD5 String	One or more MD5 key strings. The MD5 key values can be from 1 through 16 characters long. You can specify more than one key value within the list.

show ntp authentication-status

Use this command to display whether authentication is enabled or disabled.

Command Syntax `show ntp authentication-status`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ntp authentication-status
Authentication enabled
```

show ntp logging-status

Use this command to display the NTP logging status.

Command Syntax `show ntp logging-status`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ntp logging-status
NTP logging enabled
```

show ntp peer-status

Use this command to display the peers for which the server is maintaining state along with a summary of that state.

Command Syntax `show ntp peer-status`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ntp peer-status
```

show ntp peers

Use this command to display NTP peers.

Command Syntax `show ntp peers`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ntp peers
```

show ntp statistics

Use this command to display NTP statistics.

Command Syntax

```
show ntp statistics (io | local | memory | peer ( ipaddr (A.B.C.D | X:X::X:X ) |
  name (HOSTNAME)) )
```

Parameters

io	Counters maintained in the input-output module
local	Counters maintained in the local protocol module
memory	Counters related to memory allocation
peer	Counters associated with the specified peer
A.B.C.D	Peer IPv4 address
X:X::X:X	Peer IPv6 address
HOSTNAME	Peer host name

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ntp statistics local
time since restart:     1685
time since reset:       1685
packets received:       4
packets processed:      0
current version:        0
previous version:       0
declined:               0
access denied:          0 bad
length or format:    0 bad
authentication:     0 rate
exceeded:          0 #show
ntp statistics memory time
since reset:     1698 total
peer memory:     15 free peer
memory:      15 calls to
findpeer:     0 new peer
allocations: 0 peer
demobilizations: 0
 hash table counts:       0   0   0   0   0   0   0   0
                          0   0   0   0   0   0   0   0
                         0   0   0   0   0   0   0   0
                         0   0   0   0   0   0   0   0
```

0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0

Table 8-8 explains the output fields.

Table 8-8: show ntp statisticsfields

Entry	Description
Time since restart	Time when the ntp protocols were last started and how long they have been running.
Time since reset	Time when the ntp protocols were last reset and how long they have been running.
Packets received	Number of packets received from the peers.
Packets processed	Number of packets processed to the peers.
Current version	Current version of the protocol that is being used.
Previous version	Previous version of the protocol that has been used.
Declined	Access to the protocol declined
Access denied	Number of attempts denied to access protocol
Bad length or format	Number of messages received with length or format errors so severe that further classification could not occur.
Bad authentication	Number of messages received with incorrect authentication.

Rate exceeded	Exceed the configured rate if additional bandwidth is available from other queues
Total peer memory	Actual memory available to the peer system.
Free peer memory	Free memory available to the peer system.
Calls to find peer	Number of calls to find peer.
New peer allocations	Number of allocations from the free peer list.
Peer demobilizations	Number of structures freed to free peer list.
Hash table counts	Peer hash table's each bucket count.

show ntp trusted-keys

Use this command to display keys that are valid for authentication.

Command Syntax `show ntp trusted-keys`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ntp trusted-keys

Trusted Keys:
333
#
```

show running-config ntp

Use this command to display the NTP running configuration.

Command Syntax `show running-config`

`ntp (|all)`

Parameters `all` Reserved for future use

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show running-config ntp

ntp enable vrf management ntp
authenticate vrf management ntp
logging vrf management
ntp authentication-key 333 md5 3gid 7 vrf management
ntp trusted-key 333 vrf management
```

CHAPTER 9 Dynamic Host Configuration Protocol Relay

This chapter describes the Dynamic Host Configuration Protocol (DHCP) relay commands.

In small networks with only one IP subnet, DHCP clients communicate directly with DHCP servers. To allow DHCP clients on subnets not directly served by DHCP servers to communicate with DHCP servers, DHCP relay agents can be installed on these subnets. The DHCP client broadcasts on the local link and the relay agent receives the broadcast and transmits it to one or more DHCP servers using unicast. The DHCP server replies to the client and the relay agent then retransmits the response on the local network.

This chapter contains these commands:

- ip dhcp relay
- ip dhcp relay address
- ip dhcp relay information option
- ipv6 dhcp relay
- ipv6 dhcp relay address
- show ip dhcp relay
- show ip dhcp relay address
- show ipv6 dhcp relay
- show ipv6 dhcp relay address
- show ipv6 dhcp relay address interface
- show running-config dhcp

ip dhcp relay

Use this command to enable the DHCP relay agent.

Use the `no` form of this command to disable the DHCP relay agent.

Command Syntax `ip dhcp relay no ip dhcp relay`

Parameters

None

Default

By default, the ip dhcp relay is enabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip dhcp relay
```

```
#configure terminal
(config)#no ip dhcp relay
```

ip dhcp relay address

Use this command to set an IP address of a DHCP server on an interface.

Use the `no` form of this command to remove the IP address of a DHCP server.

You must give the ip dhcp relay command before you give this command.

Command Syntax `ip dhcp relay address A.B.C.D (remote-id REMOTE_ID |) no ip dhcp relay address A.B.C.D`

Parameters

`A.B.C.D` IPv4 address of the DHCP server

`REMOTE_ID` Remote host identifier. Use option 82 to provide the DHCP server information about the DHCP client.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3 and was changed in SWMRE version 1.3.5.

Examples

```
#configure terminal
(config)#interface eth2
(config-if)#ip address 2.2.2.2/24
(config-if)#ip dhcp relay address 198.51.100.127
```

ip dhcp relay information option

Use this command to enable the device to insert and remove option-82 information on DHCP packets forwarded by the relay agent.

Use the `no` form of this command to disable inserting and removing option-82 information.

Command Syntax `ip dhcp relay information option no ip dhcp relay information option`

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip dhcp relay information option

#configure terminal
(config)#no ip dhcp relay information option
```

ipv6 dhcp relay

Use this command to enable the DHCP relay agent.

Use the `no` form of this command to disable the DHCP relay agent.

Command Syntax `ipv6 dhcp relay no ipv6 dhcp relay`

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ipv6 dhcp relay

#configure terminal
(config)#no ipv6 dhcp relay
```

ipv6 dhcp relay address

Use this command to set an IPv6 address of a DHCP server on an interface.

Use the `no` form of this command to remove an IPv6 address of a DHCP server.

You must give the ip dhcp relay command before you give this command.

Note:Global IPv6 address should be configured before configuring DHCPv6 relay address on an interface.

Command Syntax `ipv6 dhcp relay address X:X::X:X ipv6 dhcp relay address X:X::X:X interface IFNAME no ipv6 dhcp relay address X:X::X:X`

`ipv6 dhcp relay address X:X::X:X`

`no ipv6 dhcp relay address X:X::X:X interface IFNAME`

Parameters

`X:X::X:X` IPv6 address of the DHCP server `IFNAME` Source interface name

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth2
(config-if)#ipv6 address 1000:ad1::30/64
(config-if)#ipv6 dhcp relay address 2001:db8::7F
```

show ip dhcp relay

Use this command to display DHCP snooping relay status including DHCP server addresses configured on interfaces.

Command Syntax `show ip dhcp relay`

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show ip dhcp relay
DHCP relay service is Enabled.
Insertion of option 82 is Disabled.
Helper addresses are configured on the following interfaces:
 Interface        Relay Address
--------         ----------- xe2
10.10.10.2
```

Table 9-9 explains the output fields.

Table 9-9: show ip dhcp relay fields

Entry	Description
Interface	Name of the interface in dhcp relay.
Relay Address	Relay address in the dhcp server.

show ip dhcp relay address

Use this command to display DHCP relay addresses.

Command Syntax `show ip dhcp relay address`

```
show ip dhcp relay address interface IFNAME
```

Parameters

`IFNAME` Interface name

Command Mode

Executive mode

Applicability

This command was introduced before SWMRE version 1.3 and changed in SWMRE version 1.3.5.

Examples

```
#show ip dhcp relay address interface eth1

Interface          Relay Address --------
------------ eth1              10.10.10.10
```

Table 9-10 explains the output.

Table 9-10: show ip dhcp relay address interface fields

Entry	Description
Interface	Interface name.
Relay Address	Relay address.

show ipv6 dhcp relay

Use this command to display DHCP snooping relay status including DHCP server addresses configured on interfaces.

Command Syntax `show ipv6 dhcp relay`

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show ipv6 dhcp relay

DHCPv6 relay service is Enabled.
Helper addresses are configured on the following interfaces:
Interface            Relay Address                              Output Interface
--------             -------------                              --------------
xe5/1                 10:10::10:1                                    xe3/1
```

Table 9-11 explains the output fields.

Table 9-11: show ipv6 dhcp relay fields

Entry	Description
Interface	Name of the interface in dhcp relay.
Relay Address	Relay address in the dhcp server.

Output Interface	Name of the output interface in dhcp relay.

show ipv6 dhcp relay address

Use this command to display DHCP server addresses configured on interfaces.

Command Syntax `show ipv6 dhcp relay address`

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show ipv6 dhcp relay address
 Interface            Relay Address                          Output Interface
--------             -------------                          --------------
xe4/2                20:10::10:2                                xe4/3
```

Table 9-12 explains the output fields.

Table 9-12: show ipv6 dhcp relay address fields

Entry	Description
Interface	Name of the interface in dhcp relay.
Relay Address	Relay address in the dhcp server.
Output Interface	Name of the output interface in dhcp relay.

show ipv6 dhcp relay address interface

Use this command to display DHCP server addresses configured on the device.

Command Syntax `show ipv6 dhcp relay address interface ethernet`
`show ipv6 dhcp relay address interface ethernet <1-4096> show`

```
ipv6 dhcp relay address interface vlan show ipv6 dhcp relay
address interface vlan <1-4096> show ipv6 dhcp relay address
interface port-channel show ipv6 dhcp relay address
interface port-channel <1-4096>
```

Entry	Description
Interface	Name of the interface in dhcp relay.

Relay Address	Relay address in the dhcp server.
Output Interface	Name of the output interface in dhcp relay.

Parameters

`ethernet`	Display DHCP server addresses configured on Ethernet interfaces
`<1-4096>`	Ethernet interface number
`port-channel`	Display DHCP server addresses configured on port-channel interfaces
`<1-4096>`	Port-channel number
`vlan`	Display DHCP server addresses configured on VLAN interfaces
`<1-4096>`	VLAN identifier

Command Mode

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show ipv6 dhcp relay address interface ethernet 1
 Interface            Relay Address                          Output Interface
--------             -------------                          --------------
Ethernet1            3ffe::2
```

Table 9-13 explains the output fields.

Table 9-13: show ipv6 dhcp relay address interface fields

show running-config dhcp

Use this command to display DHCP settings in the running configuration.

Command Syntax `show running-config dhcp`

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show running-config dhcp !

interface xe2  ip dhcp relay address 10.10.10.2 !
```

CHAPTER 10 Remote Management

This chapter is a reference for commands that copy these types of files:

- Start-up configuration and running configuration
- System files such as boot files, core dumps, and debug logs

You can use these commands to copy files locally or to copy between the local device and a remote system.

The commands in this chapter use the techniques in Table 10-14 to remotely transfer files: **Table 10-14: File transfer techniques**

Trivial File Transfer Protocol (TFTP)	No authentication or encryption; dangerous to use over the Internet, but might be acceptable in a trusted environment Address format: `tftp:[//server[:port]][/path]`
File Transfer Protocol (FTP)	Authenticates, but does not encrypt Address format: `ftp:[//server][/path]`
Secure copy (SCP)	Authenticates and encrypts using Secure Shell (SSH1) Address format: `scp:[//server][/path]`
SSH File Transfer Protocol (SFTP)	Authenticates and encrypts using Secure Shell (SSH2); this is the most secure technique Address format: `sftp:[//server][/path]`
Hyper text Transfer Protocol (HTTP)	Address format: `http:[//server][/path]` For download of running and startup configurations

This chapter contains the command listed below.

- copy running-config
- copy running-config (interactive)
- copy startup-config
- copy startup-config (interactive)
- copy system file
- copy system file (interactive)
- copy ftp startup-config
- copy ftp running-config
- copy scp startup-config
- copy scp running-config
- copy sftp startup-config
- copy sftp running-config
- copy tftp startup-config
- copy tftp running-config
- copy http startup-config
- copy http running-config

- copy scp running-config (interactive)
- copy sftp running-config (interactive)
- copy http startup-config (interactive)
- copy ftp startup-config (interactive)
- copy scp startup-config (interactive)
- copy sftp running-config (interactive)
- copy tftp startup-config (interactive)
- copy http startup-config (interactive)
- copy startup-config running-config
- copy file running-config

copy running-config

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, or a TFTP server.

Command Syntax

```
copy running-config (tftp TFTP-URL|ftp FTP-URL|scp SCP-URL|sftp SFTP-URL) (vrf
  (NAME|management)|)
```

Parameters

`TFTP-URL`	Destination: `tftp:[//server[:port]][/path]`
`FTP-URL`	Destination: `ftp:[//server][/path]`
`SCP-URL`	Destination: `scp:[//server][/path]`
`SFTP-URL`	Destination: `sftp:[//server][/path]`
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy running-config sftp sftp://sftp.mysite.com/running_conf vrf management
```

copy running-config (interactive)

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, or a TFTP server.

Command Syntax `copy running-config (ftp|tftp|scp|sftp) (vrf (NAME|management)|)`

Parameters `ftp` Destination: FTP server `tftp` Destination: TFTP server `scp` Destination: SCP server `sftp` Destination: SFTP server `NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy running-config sftp vrf management
```

copy startup-config

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, or a TFTP server.

Command Syntax

```
copy startup-config (tftp TFTP-URL|ftp FTP-URL|scp SCP-URL|sftp SFTP-URL) (vrf
  (NAME|management)|)
```

Parameters

TFTP-URL	Destination: tftp:[//server[:port]][/path]
FTP-URL	Destination: ftp:[//server][/path]
SCP-URL	Destination: scp:[//server][/path]
SFTP-URL	Destination: sftp:[//server][/path]
NAME	Virtual Routing and Forwarding name
management	Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy startup-config sftp sftp://sftp.mysite.com/start-up_conf vrf management
```

copy startup-config (interactive)

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, or a TFTP server.

Command Syntax `copy startup-config (ftp|tftp|scp|sftp) (vrf (NAME|management)|)`

Parameters `ftp` Destination: FTP server `tftp` Destination: TFTP server `scp` Destination: SCP server `sftp` Destination: SFTP server

`NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy startup-config sftp vrf management
```

copy system file

Use this command to copy a system file to an FTP server, an SCP server, an SFTP server, or a TFTP server.

Note: The names of the options for the source in the first parameter refer to symbolic locations. The specific locations for Linux are noted below. The locations on a specific device can vary depending on the platform.

Command Syntax

```
copy (core|debug|log) FILE (tftp TFTP-URL|ftp FTP-URL|scp SCP-URL|sftp SFTP-URL)
  (vrf (NAME|management)|)
```

Parameters

`core`	Core file storage; on Linux this refers to `/var/log/crash/cores/`
`debug`	Debug file storage; on Linux this refers to `/log/`
`log`	Log file storage; on Linux this refers to
`FILE`	`/var/log/` Source file name
`TFTP-URL`	Destination: `tftp:[//server[:port]][/path]`
`FTP-URL`	Destination: `ftp:[//server][/path]`
`SCP-URL`	Destination: `scp:[//server][/path]`
`SFTP-URL`	Destination: `sftp:[//server][/path]` Virtual
`NAME`	Routing and Forwarding name Management Virtual
`managemen t`	Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy core myFile sftp sftp://sftp.mysite.com/dst_filename vrf management
```

copy system file (interactive)

Use this command to copy a system file to an FTP server, an SCP server, an SFTP server, or a TFTP server.

Note: The names of the options for the source in the first parameter refer to symbolic locations. The specific locations for Linux are noted below. The locations on a specific device can vary depending on the platform.

Command Syntax `copy (core|debug|log) FILE (ftp|tftp|scp|sftp) (vrf (NAME|management)|)`

Parameters `core` Core file storage; on Linux this refers to `/var/log/crash/cores/`

`debug` Debug file storage; on Linux this refers to `/log/` `log` Log file storage; on Linux this refers to `/var/log/`

`FILE` Source file name `ftp` Destination: FTP server `tftp` Destination: TFTP server `scp` Destination: SCP server

`sftp` Destination: SFTP server `NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy log myFile sftp vrf management
```

copy ftp startup-config

Use this command to copy the start up configuration from an FTP server to the local device.

Command Syntax `copy ftp FTP-URL startup-config (vrf (NAME|management)|)`

Parameters

`FTP-URL` Configuration source: `ftp:[//server][/path] NAME`

Virtual Routing and Forwarding name `management` Management

Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy ftp ftp://ftp.mysite.com/scr filename startup-config vrf management
```

copy ftp running-config

Use this command to append the running configuration from an FTP server to the local device.

Command Syntax `copy ftp FTP-URL running-config append (store|) (vrf (NAME|management)|)` **Parameters**

`FTP-URL` Configuration source: `ftp:[//server][/path]`

`store`	Store the running-configuration
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy ftp ftp://ftp.mysite.com/scr filename running-config appen store vrf
management
```

copy scp startup-config

Use this command to copy the start up configuration from a SCP server to the local device.

Command Syntax `copy scp SCP-URL startup-config (vrf (NAME|management)|)`

Parameters

`SCP-URL` Configuration source: `scp:[//server][/path] NAME`

Virtual Routing and Forwarding name `management` Management

Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy scp scp://scp.mysite.com/scr filename startup-config vrf management
```

copy scp running-config

Use this command to append the running configuration from an SCP server to the local device.

Command Syntax `copy scp SCP-URL running-config append (store|) (vrf (NAME|management)|)`

Parameters

`SCP-URL`	Configuration source: `SCP:[//server][/path]`
`store`	Store the running configuration
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy scp scp://scp.mysite.com/scr filename running-config appen store vrf
management
```

copy sftp startup-config

Use this command to copy the start up configuration from a SFTP server to the local device.

Command Syntax `copy sftp SFTP-URL startup-config (vrf (NAME|management)|)`

Parameters

SFTP-URL	Configuration source: sftp:[//server][/path] NAME
	Virtual Routing and Forwarding name management Management
	Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy sftp sftp://sftp.mysite.com/scr filename startup-config vrf management
```

copy sftp running-config

Use this command to append the running configuration from an SFTP server to the local device.

Command Syntax copy sftp SFTP-URL running-config append (store|) (vrf (NAME|management)|)

Parameters

SFTP-URL	Configuration source: sftp:[//server][/path]
store	Store the running-configuration
NAME	Virtual Routing and Forwarding name
management	Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy sftp sftp://sftp.mysite.com/sftp filename running-config appen store vrf
management
```

copy tftp startup-config

Use this command to copy the start up configuration from a TFTP server to the local device.

Command Syntax `copy tftp TFTP-URL startup-config (vrf (NAME|management)|)`

Parameters

`TFTP-URL` Configuration source: `tftp:[//server][/path] NAME`

Virtual Routing and Forwarding name `management` Management

Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy tftp tftp://tftp.mysite.com/scr filename startup-config vrf management
```

copy tftp running-config

Use this command to append the running configuration from an FTP server to the local device.

Command Syntax `copy tftp TFTP-URL running-config append (store|) (vrf (NAME|management)|)` **Parameters**

`TFTP-URL` Configuration source: `tftp:[//server][/path]`

`store` Store the running-configuration

NAME	Virtual Routing and Forwarding name
management	Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy tftp tftp://tftp.mysite.com/scr filename running-config appen store vrf
management
```

copy http startup-config

Use this command to copy the start up configuration from a HTTP server to the local device.

Command Syntax `copy http HTTP-URL startup-config (vrf (NAME|management)|)`

Parameters

`HTTP-URL` Configuration source: `http:[//server][/path] NAME`

Virtual Routing and Forwarding name `management` Management

Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy http http://http.mysite.com/scr filename startup-config vrf management
```

copy http running-config

Use this command to append the running configuration from an FTP server to the local device.

Command Syntax `copy http HTTP-URL running-config append (store|) (vrf (NAME|management)|)`

Parameters

`HTTP-URL`	Configuration source: `http:[//server][/path]`
`store`	Store the running-configuration
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy http http://http.mysite.com/scr filename running-config appen store vrf
management
```

copy scp running-config (interactive)

Use this command to copy and store the running configuration from an SCP server to the local device.

Command Syntax `copy scp running-config (append|) store (vrf (NAME|management)|)`

Parameters `append` Append the configuration into running-config `NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy scp running-config append store vrf management
```

copy sftp running-config (interactive)

Use this command to copy and store the running configuration from an SFTP server to the local device.

Command Syntax `copy sftp running-config (append|) store (vrf (NAME|management)|)`

Parameters `append` Append the configuration into running-config `NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy sftp running-config append store vrf management
```

copy tftp running-config (interactive)

Use this command to copy and store the running configuration from a TFTP server to the local device.

Command Syntax `copy tftp running-config (append|) store (vrf (NAME|management)|)`

Parameters `append` Append the configuration into running-config `NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy tftp running-config append store vrf management
```

copy http running-config (interactive)

Use this command to copy and store the running configuration from a TFTP server to the local device.

Command Syntax `copy http running-config (append|) store (vrf (NAME|management)|)`

Parameters `append` Append the configuration into running-config `NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy http running-config append store vrf management
```

copy ftp startup-config (interactive)

Use this command to copy the start up confguration from an FTP server to the local device.

Command Syntax `copy ftp startup-config (vrf (NAME|management)|)`

Parameters

`NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy ftp startup-config vrf management
```

copy scp startup-config (interactive)

Use this command to copy the start up confguration from a SCP server to the local device.

Command Syntax `copy scp startup-config (vrf (NAME|management)|)`

Parameters

`NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy scp startup-config vrf management
```

copy sftp startup-config (interactive)

Use this command to copy the start up confguration from an SFTP server to the local device.

Command Syntax `copy sftp startup-config (vrf (NAME|management)|)`

Parameters

`NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy sftp startup-config vrf management
```

copy tftp startup-config (interactive)

Use this command to copy the start-up confguration from a TFTP server to the local device.

Command Syntax `copy tftp startup-config (vrf (NAME|management)|)`

Parameters

`NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy tftp startup-config vrf management
```

copy http startup-config (interactive)

Use this command to copy the start-up confguration from a TFTP server to the local device.

Command Syntax `copy http startup-config (vrf (NAME|management)|)`

Parameters

`NAME` Virtual Routing and Forwarding name `management` Management Virtual Routing and Forwarding

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy http startup-config vrf management
```

copy startup-config running-config

Use this command to copy the start-up configuration to the running configuration.

Command Syntax `copy startup-config running-config`

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy startup-config running-config
```

copy file running-config

Use this command to copy and store a file into the running configuration.

Command Syntax `copy file FILE running-config (append|) store`

Parameters

`FILE`	File name
`append`	Append the configuration into running-config

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#copy file myFile running-config append store
```

© Symanitron

CHAPTER 11 Software Monitoring and Reporting

This document describes software watchdog and reporting related commands.

- feature software-watchdog
- show bootup-parameters
- show cores
- show software-watchdog status
- show system log
- show system login
- show system reboot-history
- show system resources
- show system uptime
- show techsupport
- software-watchdog
- software-watchdog keep-alive-time

feature software-watchdog

Use this command to enable software watchdog functionality for all SWMRE modules. This feature is enabled by default.

Use the `no` form of this command to disable software watchdog functionality.

Command Syntax

```
feature software-watchdog
no feature software-watchdog
```

Parameter

None

Default

By default, software watchdog is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
#(config)feature software-watchdog
```

show bootup-parameters

Use this command to show SWMRE kernel bootup parameters.

Command Syntax `show bootup-parameters`

Parameter

None

Command Mode

Execution mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show bootup-parameters
BOOT_IMAGE=/boot/vmlinuz-3.16.0-41-generic root=/dev/sda4
console=ttyS0,115200n8 ro
```

show cores

Use this command to list core files in the system or to display information about a given core file.

Command Syntax `show cores`

`(|WORD details)`

Parameter

`WORD`	Core file name

Command Mode

Execution mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show cores
Core file and Crash log location :/var/log/crash/cores
Process Name    PID             Core-File-Name      -----------
-     ---             --------------     sflow            29355
core_sflow.29355_20130531_044219 vrrpd           6792
core_vrrpd.6792_20130531_044236

>show details
core_vrrpd.6792_20130531_044236 /* This
shows output of following commands top -n 1
-b gdb output of bt full info proc info
sharedlib info target info registers info
threads thread apply all bt full netstat -
apn netstat -avs
*/
```

Table 11-15 explains the output fields.

Table 11-15: show cores fields

Entry	Description
Process Name	String that identifies the process.
PID	Process ID, a number that identifies a process.
Core-File-Name	Core dump-file where the file resides and the filename.

show software-watchdog status

Use this command to display the software watchdog status for each SWMRE module.

Command Syntax `show software-watchdog status show software-watchdog status detail`

Parameter

None

Command Mode

Execution mode

Applicability

This command was introduced before SWMRE version 1.3 and updated in SWMRE version 1.3.4.

Examples

```
#show software-watchdog status
Software Watchdog timeout in seconds : 60
Process name         Watchdog status
============         ===============
nsm                  Enabled ripd
Enabled ripngd               Enabled
ospfd                Enabled ospf6d
Enabled isisd                Enabled
hostpd               Enabled ldpd
Enabled rsvpd                Enabled
mribd                Enabled pimd
Enabled authd                Enabled
mstpd                Enabled imi
Enabled onmd                 Enabled

```

Table 11-16 explains the output fields.

Table 11-16: show software-watchdog status output fields

Field	Description
Process Name	The name of a protocol module.
Watchdog Status	Status of a protocol module (Enabled or Disabled).
Process Status	Status of the protocol module Running/Not-running).
Disconnect Count	Number of times the protocol module disconnected from monitoring module.

Table 11-16: show software-watchdog status output fields (Continued)

	Description
Count	Number of times the protocol module connected to monitoring module.
tart Reason	Reason why a module disconnected from monitoring module.

show system log

Use this command to display the system's log file.

Command Syntax

```
show system log
```

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show system log
Syslog              : enabled      File Name   : /var/log/messages
Oct 18 18:10:18 localhost rsyslogd: [origin software="rsyslogd"

```

Table 11-17 explains the output fields.

Table 11-17: show system log fields

	Description
	Status of the protocol (enabled or disabled).
	Specifies the name of the system log files that you configured.

show system login

Use this command to display the system's login history.

Command Syntax `show system login`

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show system login
eric      ttyS0                         Wed Oct 19 18:31   still logged in takayuki
ttyS0                         Wed Oct 19 18:14 - 18:25  (00:10) girish    ttyS0
Wed Oct 19 16:46 - 17:01  (00:14) wtmp begins Wed Oct 19 16:46:18 2016
```

show system reboot-history

Use this command to show the SWMRE reboot history.

Command Syntax `show system reboot-history`

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show system reboot-history
#) On Thu Jun 6 06:16:03 2013
Reason: Reset Requested by Active User
Service: NONE
#) On Thu Jun 6 06:21:30 2015
Reason: Reset Requested due to Process Crash
Service: nsm
#
```

Table 11-17 explains the output fields.

Table 11-18: show system reboot-history fields

Entry	Description
Reason	Displays the reason, why the fields are reset.
Service	Name of the service in this protocol.

show system resources

Use this command to display the system's current resources.

Command Syntax `show system resources (iteration <1-5>|)`

Parameters

`<1-5>` The number of times to check the resources before they are displayed.

Command Mode

Execution mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
DELL-6K3#show system resources load
average: 0.11, 0.08, 0.05
Tasks: 113 total,   1 running, 112 sleeping,   0 stopped,   0 zombie
%Cpu(s):   1.1 us,  0.4 sy,  0.0 ni, 98.5 id,   0.0 wa,   0.0 hi,  0.0 si,  0.0
st
KiB Mem:    8181040 total,    736124used,   7444916 free,    133012 buffers

#show system resources iteration 5 load
average: 0.03, 0.06, 0.05
Tasks: 112 total,   3 running, 109 sleeping,   0 stopped,   0 zombie
%Cpu(s):   1.0 us,  0.6 sy,  0.0 ni, 98.4 id,   0.0 wa,   0.0 hi,  0.0 si,  0.0
st
KiB Mem:    8181040 total,    736608used,   7444432 free,    132976 buffers
KiB Swap:         0 total,         0used,         0 free.    252416 cached Mem
```

Table 11-19 explains the output fields.

Table 11-19: show system resource fields

Entry	Description
Load Average	Number of processes that are running. The average reflects the system load the past 1, 5, and 15 minutes.
Tasks	Number of processes in the system and how many processes are actually running when the command is issued.
CPU	Displays the CPU utilization information for processes on the device.

Table 11-19: show system resource fields

	Description
	The memory field (Mem) shows the virtual memory used by processes. The value in the memory field is in KB and MB, and is broken down as follows: Total: The total amount of available virtual memory, in kibibytes (KiBs). Used:The total amount of used virtual memory, in kibibytes (KiBs). Free: The total amount of free virtual memory, in kibibytes (KiBs) Buffers: The size of the memory buffer used to hold data recently called from disk.
	The Swap field shows the total swap space available and how much is unused and is broken down as follows: Total: The total amount of available swap memory, in kibibytes (KiBs). Used: The total amount of used swap memory, in kibibytes (KiBs). Free: The total amount of free swap memory, in kibibytes (KiBs). Cache Memory: Memory that is not associated with any program and does not need to be swapped before being reused.

show system uptime

Use this command to display how lone the system has been up and running.

Command Syntax `show system uptime`

Parameters

None

Command Mode

Execution mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
DELL-6K3#show system uptime
            19:10:22 up 1 day,  1:01,  1 user,  load average: 0.08, 0.05, 0.05
```

Table 11-20 explains the output fields.

Table 11-20: show system uptime fields

Entry	Description
Time and up	Current time, in the local time zone, and how long the router or switch has been operational.
Users	Number of users logged in to the router or switch.
Load Average	Number of processes that are running. The average reflects the system load the past 1, 5, and 15 minutes.

show techsupport

Use this command to collect system data for technical support to save support information in a compressed (.gz) file.

The default file path is `/var/log/` and the filename is `tech_support_YYYY_MMM_DD_HH_MM_SS.tar.gz`.

The filename given can be the same as another file; to distinguish them, each of the filenames are appended with a date and timestamp.

If a `show techsupport` command execution is in progress, any newly issued `show techsupport` commands are ignored.

If a `show techsupport` command is executing, and the `show running-config` command is given, the displayed information is copied from the `show techsupport` command.

Command Syntax

```
show techsupport
  ({bgp|authd|isis|lag|ldp|mstp|ospf|pim|hostpd|hsl|l2mribd|mribd|nsm|oam|onm|os
p6   |rib|ripng|sflow|vrrp|rip|rsvp|imi|trill|all|cmmd})(log-path   WORD)(status)
```

Parameters:

`daemon`	Protocol/daemon name
`WORD`	The path and filename (log-path) where the technical support information is saved.
`status`	Displays the status of the completion of the technical support `tar_.gz` file.
`all`	Include all protocol information in the technical support `tar_.gz` file.

Default

The default file path for show techsupport is /var/log/.

Command Mode

Privileged EXEC

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show techsupport all
#show techsupport all log-path /home/filename
#show techsupport nsm
#show techsupport nsm log-path /home/filename
#show techsupport hostpd authd imi
#show techsupport hostp authd imi log-path /home/filename
#show techsupport status
```

software-watchdog

Use this command to enable the software watchdog feature for an SWMRE module.

Use the `no` form of this command to disable the software watchdog feature.

Command Syntax

```
software-watchdog (nsm|authd|bgpd|cmld|hostpd|imi|isisd|lagd|l2mribd|
  mstpd|mribd|ndd|oamd|onmd|ospfd|ospf6d|pimd|ribd|ripd|ripngd|sflow|vlogd|vrrpd
  | | ldpd|rsvpd||trilld|hsl|cmmd)

no software-watchdog (nsm|authd|bgpd|cmld|hostpd|imi|isisd|lagd|l2mribd|
  mstpd|mribd|ndd|oamd|onmd|ospfd|ospf6d|pimd|ribd|ripd|ripngd|sflow|vlogd|vrrpd
  | | ldpd|rsvpd||trilld|hsl|cmmd)
```

Parameters

`nsm`	NSM module
`authd`	AUTH module
`bgpd`	BGP module
`cmld`	CML module
`hostpd`	HOSTP module

imi	IMI module
isisd	ISIS module
lagd	LAG module
l2mribd	L2MRIB module
mstpd	MSTP module
mribd	MRIB module
ndd	NDD module
oamd	OAM module
onmd	ONM module
ospfd	OSPF module
ospf6d	OSPF6 module
pimd	PIM module
ribd	RIB module
ripd	RIP module
ripngd	RIPNG module
sflow	SFLOW module
vlogd	VLOG module
vrrpd	VRRP module
ldpd	LDP module
rsvpd	RSVP module
trilld	TRILL module
hsl	HSL module
cmmd	CMM module

Default

By default, software watchdog is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
                    #(config)no software-watchdog imi
#(config)software-watchdog nsm
```

software-watchdog keep-alive-time

Use this command to set the software watchdog keep-alive time interval in seconds. The default keep-alive time interval is 60 seconds.

Use the `no` form of this command to set default keep-alive time interval.

Command Syntax `software-watchdog keep-alive-time <30-1800> no software-watchdog keep-alive-time`

Parameters

`<30-1800>`	Keep-alive time interval in seconds

Default

By default, software watchdog is enabled and the keep-alive time interval is 60 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
#(config)software-watchdog keep-alive-time 100
```

Authentication Command Reference

Contents

This document contains these chapters:

- Chapter 1, *Authentication, Authorization and Accounting*
- Chapter 2, *RADIUS*
- Chapter 3, *TACACS+*

© Symanitron

Authentication Command Reference

CHAPTER 1 Authentication, Authorization and Accounting

This chapter is a reference for the authentication:

- Authentication identifies users by challenging them to provide a user name and password. This information can be encrypted if required, depending on the underlying protocol.
- Authorization provides a method of authorizing commands and services on a per user profile basis.

Note: Authorization will be auto-enabled if user enables the Authentication.

- Accounting collects detailed system and command information and stores it on a central server where it can be used for security and quality assurance purposes.

The authentication feature allows you to verify the identity and, grant access to managing devices. The authentication feature works with the access control protocols as described in these chapters:

- Chapter 2, *RADIUS*
- Chapter 3, *TACACS+*

Note: Only network administrators can execute these commands. For more, see the username command.

Note: The commands below are supported only on the “management” VRF.

This chapter describes these commands:

- aaa authentication login default
- aaa accounting details
- aaa authentication login console
- aaa authentication login default
- aaa authentication login default fallback error
- aaa group server
- aaa local authentication attempts max-fail
- aaa local authentication unlock-timeout
- debug aaa
- server
- show aaa authentication
- show aaa authentication login
- show aaa accounting
- show aaa groups
- show running-config aaa

aaa authentication login

Use this command to set login authentication behavior.

Use the `no` form of this command to disable either authentication behavior.

Command Syntax `aaa authentication login error-enable (vrf management|) no aaa authentication login error-enable (vrf management|)`

Parameters `error-enable` Display login failure messages `management`

Management VRF

Default

By default, aaa authentication login is local

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
                (config)#aaa authentication login error-enable vrf management
```

aaa accounting details

Use this command to set a list of server groups to which to redirect accounting logs.

Use the `no` form of this command to only log locally.

Command Syntax `aaa accounting default (vrf management|) ((group LINE)|local) no aaa accounting default (vrf management|) ((group LINE)|local)`

Parameters `group` Server group list for authentication

`LINE` A space-separated list of up to 8 configured RADIUS or TACACS+ server group names `local` Use local authentication `management` Management VRF

Default

Default AAA method is local

Default groups: RADIUS or TACACS+

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#aaa accounting default vrf management group radius
```

aaa authentication login console

Use this command to set the AAA authentication methods for console log ins.

Use the `no` form of this command to set the default AAA authentication method (local).

Command Syntax `aaa authentication login console ((group LINE) | (local (|none)) | (none)) no aaa authentication login console ((group LINE) | (local (|none)) | (none))`

Parameters `group` Use a server group list for authentication

`LINE` Specify a space-separated list of up to 8 configured RADIUS or TACACS+ server group names followed by `local` or `none` or both `local` and `none`. The list can also include:

`radius` All configured RADIUS servers

`tacacs+` All configured TACACS+ servers

`local` Use local authentication `none` No authentication

Default

Default AAA authentication method is local Default

groups: RADIUS or TACACS+

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#aaa authentication login console group radius
```

aaa authentication login default

Use this command to set the AAA authentication methods.

Use the `no` form of this command to set the default AAA authentication method (local).

Command Syntax

```
aaa authentication login default (vrf management|) ((group LINE) | (local (|none))
  | (none)) no aaa authentication login default (vrf management|) ((group
LINE) | (local (|none)) | (none))
```

Parameters

`group`		Use a server group list for authentication
	`LINE`	A space-separated list of up to 8 configured RADIUS or TACACS+, server group names followed by `local` or `none` or both `local` and `none`. The list can also include:
		`radius` All configured RADIUS servers
		`tacacs+` All configured TACACS+ servers
`local`		Use local authentication
`none`		No authentication
`management`		Management VRF

Default

By default, AAA authentication method is local

By default, groups: RADIUS or TACACS+

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#aaa authentication login default vrf management group radius
```

aaa authentication login console fallback error

Use this command to enable fallback to local authentication for the console login if remote authentication is configured and all AAA servers are unreachable.

Use the `no` form of this command to disable fallback to local authentication.

Command Syntax `aaa authentication login console fallback error local`

`no aaa authentication login console fallback error local`

Parameters

None

Default

By default, AAA authentication is local

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#aaa authentication login console fallback error local
```

aaa authentication login default fallback error

Use this command to enable fallback to local authentication for the default login if remote authentication is configured and all AAA servers are unreachable.

Use the `no` form of this command to disable fallback to local authentication.

Command Syntax `aaa authentication login default fallback error local (vrf management|) no aaa authentication login default fallback error local (vrf management|)`

Parameters `management` Management

VRF

Default

By default, AAA authentication is local.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#aaa authentication login default fallback error local vrf management
```

aaa group server

Use this command to create a server group and enter server group configuration mode.

Use the `no` form of this command to remove a server group.

Command Syntax `aaa group server (radius|tacacs+) WORD (vrf management|) no aaa group server (radius|tacacs+) WORD (vrf management|)`

Parameters

`radius`	RADIUS server group
`tacacs+`	TACACS+ server group
`WORD`	Server group name; maximum 127 characters
`management`	Management VRF

Default

By default, the AAA group server option is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#aaa group server radius maxsmart
(config-radius)#
```

aaa local authentication attempts max-fail

Use this command to set the number of unsuccessful authentication attempts before a user is locked out.

Use the `no` form of this command to disable the lockout feature.

Command Syntax `aaa local authentication attempts max-fail <1-25> (vrf management|) no aaa local authentication attempts max-fail (vrf management|)`

Parameters

`<1-25>` Range of number of unsuccessful authentication attempts `management` Management VRF

Default

By default, the maximum number of unsuccessful authentication attempts before a user is locked out is 3.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#aaa local authentication attempts max-fail 2 vrf management
```

aaa local authentication unlock-timeout

Use this command to set timeout value in seconds to unlock local user-account.

Use the no form of this command to set default timeout value in seconds.

Note: This command is applicable only to local user but not for user/s present at the server end to authenticate using TACACS+ or RADIUS.

Command Syntax `aaa local authentication unlock-timeout <1-3600> (vrf management|)` `no aaa local authentication unlock-timeout (vrf management|)`

Parameters

`<1-3600>` Range of timeout value in seconds to unlock local user-account. Default value is 1200

`management` Management VRF

Default

By default, the unlock timeout is 1200 seconds

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#aaa local authentication unlock-timeout 1800
```

debug aaa

Use this command to display AAA debugging information.

Use the `no` form of this command to stop displaying AAA debugging information.

Command Syntax `debug aaa no debug aaa`

Parameters

None

Command Mode

Executive mode and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#debug aaa
```

server

Use this command to add a server to a server group.

Use the `no` form of this command to remove from a server group.

Command Syntax `server (A.B.C.D | X:X::X:X | HOSTNAME) no server (A.B.C.D | X:X::X:X | HOSTNAME)`

Parameters

`A.B.C.D`	IPv4 address
`X:X::X:X`	IPv6 address

Default

None

Command Modes

RADIUS server group configure mode

TACACS+ server group configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#feature tacacs+
                                    (config)#aaa group server tacacs+ TacacsGroup4
(config-tacacs)#server 203.0.113.127
```

show aaa authentication

Use this command to display AAA authentication configuration.

Command Syntax `show aaa authentication (|vrf(management|all))`

Parameters

None

Command Modes

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show aaa authentication                VRF: default
default: local   console: local
```

Table 1-21 explains the output fields.

Table 1-21: show aaa authentication fields

Entry	Description
VRF	Virtual Routing and Forwarding (VRF) default support.
Default	Displays the aaa authentication method list.
Console	Authentication setting for the console access.

show aaa authentication login

Use this command to display AAA authentication configuration for login default and login console.

Command Syntax `show aaa authentication login error-enable (|vrf management|all))`

Parameters `error-enable` Display setting for login failure messages `vrf`

Management VRF or all VRFs

Command Modes

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show aaa authentication login error-enable
                VRF: default disabled
```

show aaa groups

Use this command to display AAA group configuration.

Command Syntax `show aaa groups (vrf (management|all)|)`

Parameters

`vrf`	Management VRF or all VRFs

Command Modes

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show aaa groups VRF: default radius
```

show aaa accounting

Use this command to display AAA accounting configuration.

Command Syntax `show aaa accounting (vrf (management|all)|)`

Parameters

`vrf`	Management VRF or all VRFs

Command Modes

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show aaa accounting
                VRF: default
```

show running-config aaa

Use this command to display AAA settings in the running configuration.

Command Syntax `show running-config aaa (vrf(management|all)|)`

Parameters

`vrf`	Management VRF or all VRFs

Command Modes

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show aaa accounting                VRF: default
default: local
```

Table 1-22 explains the output fields.

Table 1-22: show aaa accounting fields

Entry	Description
VRF	Virtual Routing and Forwarding (VRF) default support.
Default	Displays the aaa authentication method list.

© Symanitron

CHAPTER 2 RADIUS

This chapter is a reference for Remote Authentication Dial In User Service (RADIUS) commands, RADIUS provides centralized Authentication, Authorization management for users that connect to and use a network service. RADIUS is specified in RFC 2865.

Note: Only network administrators can execute these commands. For more, see the username command.

Note: The commands below are supported only on the “management” VRF.

- debug radius
- radius-server login host
- radius-server login host acct-port
- radius-server login host auth-port
- radius-server login host key
- radius-server login key
- radius-server login timeout
- show debug radius
- show radius-server
- show running-config radius

debug radius

Use this command to display RADIUS debugging information.

Use the `no` form of this command stop displaying RADIUS debugging information.

Command Syntax `debug radius no debug radius`

Parameters

None

Command Mode

Executive mode and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#debug radius
```

radius-server login host

Use this command to configure a RADIUS server for both accounting and authentication.

Use the `no` form of this command to remove a RADIUS server.

Command Syntax `radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|)`

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) timeout
  <1-60> no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf
management|) no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME)
(vrf management|)
  timeout
```

Parameters

`login`	Remote login
`A.B.C.D`	IPv4 address of RADIUS server
`X:X::X:X`	IPv6 address of RADIUS server
`HOSTNAME`	DNS host name of RADIUS server
`timeout`	How long to wait for a response from the RADIUS server before declaring a timeout failure
`<1-60>`	Range of time out period in seconds
`vrf`	Virtual Routing and Forwarding
`management`	Management VRF

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#radius-server login host 203.0.113.15 vrf management
```

radius-server login host acct-port

Use this command to configure a RADIUS server and specify a UDP port to use for RADIUS accounting messages.

Use the `no` form of this command to remove a RADIUS server.

Command Syntax

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) acct-
```

```
port <0-65535> |) | timeout <1-60> |)
```

```
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) acct-
port |) | timeout <1-60> |)
```

Parameters

`login`	Remote login
`A.B.C.D`	IPv4 address of RADIUS server
`X:X::X:X`	IPv6 address of RADIUS server
`HOSTNAME`	DNS host name of RADIUS server
`acct-port`	UDP port to use for RADIUS accounting messages
`<0-65535>`	Range of UDP port numbers
`timeout`	How long to wait for a response from the RADIUS server before declaring a timeout failure
`<1-60>`	Range of timeout period in seconds
`vrf`	Virtual Routing and Forwarding
`management`	Management VRF

Default

By default, radius-server login host acct-port is 1813

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#radius-server login host 192.168.2.3 vrf management acct-port 23255
```

radius-server login host auth-port

Use this command to configure a RADIUS server and specify a UDP port to use for RADIUS authentication messages.

Use the `no` form of this command to remove a RADIUS server.

Command Syntax

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (|(auth-
port <0-65535> (|(acct-port <0-65535> (|(timeout <1-60>))))))
```

```
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|)
(auth-port (|(acct-port (|timeout))))
```

Parameters

`login`	Remote login
`A.B.C.D`	IPv4 address of RADIUS server

X:X::X:X	IPv6 address of RADIUS server
HOSTNAME	DNS host name of RADIUS server
auth-port	UDP port to use for RADIUS accounting messages
<0-65535>	Range of UDP port numbers
acct-port	UDP port to use for RADIUS accounting messages
<0-65535>	Range of UDP port numbers
timeout	How long to wait for a response from the RADIUS server before declaring a timeout failure
<1-60>	Range of timeout period in seconds
vrf	Virtual Routing and Forwarding
management	Management VRF

Default

By default, radius-server login host acct-port is 1812

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#radius-server login host 203.0.113.15  vrf management auth-port 23255
```

radius-server login host key

Use this command to set per-server shared key (“shared secret”) which is a text string shared between the device and RADIUS servers.

Use the no form of this command to remove a server shared key.

Command Syntax

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (|(key
  ((0 WORD) | (7 WORD) | (WORD)) (|(auth-port <0-65535> (|(acct-port <0-65535>
  (|(timeout <1-60>)))))))) no radius-server login host (A.B.C.D | X:X::X:X |
HOSTNAME) (vrf management|) (key

  ((0 WORD) | (7 WORD) | (WORD)) (|(auth-port <0-65535> (|(acct-port
  (|(timeout)))))))
```

Parameters

login	Remote login
A.B.C.D	IPv4 address of RADIUS server
X:X::X:X	IPv6 address of RADIUS server
HOSTNAME	DNS host name of RADIUS server
0	Unencrypted (clear text) shared key

WORD	Unencrypted key value; maximum length 63 characters
7	Hidden shared key
WORD	Hidden key value; maximum length 63 characters
WORD	Unencrypted (clear text) shared key value; maximum length 63 characters
auth-port	UDP port to use for RADIUS accounting messages
<0-65535>	Range of UDP port numbers
acct-port	UDP port to use for RADIUS accounting messages
<0-65535>	Range of UDP port numbers
timeout	How long to wait for a response from the RADIUS server before declaring a timeout failure
<1-60>	Range of timeout period in seconds
vrf	Virtual Routing and Forwarding
management	Management VRF

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced SWMRE version 1.3.2.

Examples

```
#configure terminal
(config)#radius-server login host 203.0.113.15 vrf management key 0
testing auth-port 23255
```

radius-server login key

Use this command to set a global preshared key (“shared secret”) which is a text string shared between the device and RADIUS servers.

Use the `no` form of this command to remove a global preshared key.

Command Syntax `radius-server login key ((0 WORD) | (7 WORD) | (WORD)) (vrf management|) no radius-server login key ((0 WORD) | (7 WORD) | (WORD)) (vrf management|)`

Parameters

`login`	Remote login
`0`	Unencrypted (clear text) shared key
`WORD`	Unencrypted key value; maximum length 63 characters
`7`	Hidden shared key
`WORD`	Hidden key value; maximum length 63 characters
`WORD`	Unencrypted (clear text) shared key value; maximum length 63 characters `vrf`
	Virtual Routing and Forwarding `management` Management VRF

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#radius-server login key 7 p2AcxlQA vrf management

#configure terminal
(config)#no radius-server login key 7 p2AcxlQA vrf management
```

radius-server login timeout

Use this command to set the global timeout which is how long the device waits for a response from a RADIUS server before declaring a timeout failure.

Use the `no` form of this command to set the global timeout to its default (1 second).

Command Syntax `radius-server login timeout <1-60> (vrf management|) no radius-server login timeout (vrf management|)`

Parameters

`login`	Remote login
`<1-1000>`	Range of timeout period in seconds
`vrf`	Virtual Routing and Forwarding
`management`	Management VRF

Default

By default, radius-server login timeout is 5 seconds

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#radius-server login timeout 15 vrf management

#configure terminal
(config)#no radius-server login timeout 15 vrf management
```

show debug radius

Use this command to display debugging information.

Command Syntax `show debug radius`

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show debug radius
```

show radius-server

Use this command to display the RADIUS server configuration.

Command Syntax `show radius-server (|vrf(management|all))((WORD)|(groups (GROUP|))|)|sorted`

Parameters

`WORD`	DNS host name or IP address
`groups`	RADIUS server group
`GROUP`	Group name; if this parameter is not specified, display all groups
`sorted`	Sort by RADIUS server name
`vrf`	management or all VRFs

Command Mode

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show radius-server
        VRF: default timeout value:
5

Total number of servers:1
```

Table 2-23 explains the output fields.

Table 2-23: show radius-server fields

Entry	Description
VRF	Virtual Routing and Forwarding (VRF) default support.
Timeout Value	Period the local router waits to receive a response from a RADIUS accounting server before retransmitting the message
Total number of servers	Number of authentication requests received by the authentication server.

show running-config radius

Use this command to display RADIUS configuration settings in the running configuration.

Command Syntax `show running-config radius`

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show running-config radius
```

CHAPTER 3 TACACS+

Terminal Access Controller Access-Control System Plus (TACACS+, usually pronounced like tack-axe) is an access control network protocol for network devices.

The differences between RADIUS and TACACS+ can be summarized as follows:

- RADIUS combines authentication and authorization in a user profile, while TACACS+ provides separate authentication.
- RADIUS encrypts only the password in the access-request packet sent from the client to the server. The remainder of the packet is unencrypted. TACACS+ encrypts the entire body of the packet but leaves a standard TACACS+ header.
- RADIUS uses UDP, while TACACS+ uses TCP.
- RADIUS is based on an open standard (RFC 2865). TACACS+ is proprietary to Cisco, although it is an open, publicly documented protocol (there is no RFC protocol specification for TACACS+).

Note: Only network administrators can execute these commands. For more, see the username command.

Note: The commands below are supported only on the “management” VRF. This chapter contains these commands:

- add policy
- debug tacacs+
- default
- deny
- feature dynamic-rbac enable
- feature tacacs+
- permit
- policy
- role
- show debug tacacs+
- show policy
- show rbac-role
- show running-config tacacs+
- show tacacs-server
- tacacs-server login host
- tacacs-server login key

add policy

Use this command to add a policy to a TACACS+ role-based authorization (RBAC) role.

Use the `no` form of this command to remove a policy from an RBAC role.

Command Syntax `add policy POLICY-NAME no add policy`

`POLICY-NAME`

Parameters

`POLICY-NAME` Name of the policy

Default

None

Command Mode

RBAC role mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
(config)#role myRole
(config-role)#default permit-all
(config-role)#add policy myPolicy1
(config-role)#no add policy myPolicy2
```

debug tacacs+

Use this command to display TACACS+ debugging information.

Use the `no` form of this command stop displaying TACACS+ debugging information.

Command Syntax `debug tacacs+ no debug tacacs+`

Parameters

None

Default

Disabled

Command Mode

Executive mode and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#debug tacacs+
```

default

Use this command to set the default rule for a TACACS+ role-based authorization (RBAC) role.

Command Syntax `default (permit-all | deny-all)`

Parameters `permit-all` Permit all commands `deny-all`

Deny all commands

Default

Unless you explicitly give this command, the default rule for a role is `deny-all`.

Command Mode

RBAC role mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
(config)#role myRole
(config-role)#default permit-all
(config-role)#add policy myPolicy1
(config-role)#add policy myPolicy2
```

deny

Use this command to add a deny rule to a TACACS+ role-based authorization (RBAC) policy.

Use the `no` form of this command to remove a deny rule from an RBAC policy.

Command Syntax `deny RULE-STRING (mode MODE-NAME |) no deny RULE-STRING (mode MODE-NAME |)`

Parameters

`RULE-STRING`	Command string
`MODE-NAME`	Command prompt string such as “(config-router)” or “(config-if)’. Deny access to the command only in this mode.

Default

None

Command Mode

RBAC policy mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
#configure terminal
(config)#policy myPolicy
(config-policy)#deny "ip address" mode (config-if)
```

feature dynamic-rbac enable

Use this command to enable the TACACS+ role-based authorization (RBAC) feature.

Use the `no` form of this command to disable the RBAC feature.

Command Syntax `feature dynamic-rbac enable no feature dynamic-rbac enable`

Parameters

None

Default

By default, feature TACACS+ RBAC is disabled

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
#configure terminal
(config)#feature dynamic-rbac enable
```

feature tacacs+

Use this command to enable the TACACS+ feature.

Use the `no` form of this command to disable the TACACS+ feature.

Command Syntax `feature tacacs+ (vrf management|) no feature tacacs+ (vrf management|)`

Parameters `vrf` Virtual Routing and Forwarding `management` Management VRF

Default

By default, feature tacacs+ is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
                    (config)#feature tacacs+ vrf management
```

permit

Use this command to add a permit rule to a TACACS+ role-based authorization (RBAC) policy.

Use the `no` form of this command to remove a permit rule in an RBAC policy.

Command Syntax `permit RULE-STRING (mode MODE-NAME |) no permit RULE-STRING (mode MODE-NAME |)`

Parameters

`RULE-STRING`	Command string
`MODE-NAME`	Command prompt string such as “(config-router)” or “(config-if)”. Permit access to the command only in this mode.

Default

None

Command Mode

RBAC policy mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
#configure terminal
(config)#policy myPolicy
(config-policy)#permit “ip address” mode (config-if)
```

policy

Use this command to create a TACACS+ role-based authorization (RBAC) policy and enter RBAC policy mode.

Use the `no` form of this command to remove an RBAC policy.

Command Syntax `policy POLICY-NAME no policy POLICY-NAME`

Parameters

`POLICY-NAME` Policy name

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
#configure terminal
(config)#policy myPolicy
(config-policy)#permit "ip address" mode (config-if)
```

role

Use this command to create a TACACS+ role-based authorization (RBAC) role and enter RBAC role mode.

Use the `no` form of this command to remove an RBAC role.

Command Syntax `role ROLE-NAME no role ROLE-NAME`

Parameters

`ROLE-NAME` Role name.

You *cannot* specify one of these roles already defined in SWMRE:

`network-admin network-user network-operator network-engineer`

For more about these built-in roles, see username.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
(config)#role myRole
(config-role)#default permit-all
(config-role)#add policy myPolicy1
(config-role)#add policy myPolicy2
```

show debug tacacs+

Use this command to display whether TACACS+ debugging is enabled.

Command Syntax `show debug tacacs+`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show debug tacacs+
```

show policy

Use this command to display TACACS+ role-based authorization (RBAC) policies.

Command Syntax `show policy (POLICY-NAME |)`

Parameters

`POLICY-NAME` Policy name

Default

None

Command Mode

Exec and privileged exec mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
#show policy myPolicy
```

show rbac-role

Use this command to display information about TACACS+ role-based authorization (RBAC) roles.

Command Syntax `show rbac-role (ROLE-NAME |)`

Parameters

`ROLE-NAME`	Role name

Default

None

Command Mode

Exec and privileged exec mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
#show rbac-role myRole
```

Table 3-24 explains the output fields.

Table 3-24: show rbac-role fields

Entry	Description
Role Name	Role name
Default rule	permit-all or deny-all
Attached Policies	Name of policies attached to this role

show running-config tacacs+

Use this command to display TACACS+ settings in the running configuration.

Command Syntax `show running-config tacacs+`

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show running-config tacacs+ feature tacacs+ vrf management tacacs-server host
10.16.19.2 seq-num 1 vrf management key 7 "wawyanb"
```

Table 3-25 explains the output fields.

Table 3-25: show running-config fields

Entry	Description
TACAS server host	TACACS+ server Domain Name Server (DNS) name.
Seq-num	Sequence number of user authentication attempt with the TACACS+ server.
VRF Management	The management traffic using VPN Routing and Forwarding (VRFs).

show tacacs-server

Use this command to display the TACACS+ server configuration.

Command Syntax `show tacacs-server (|vrf (management|all))((WORD)|(groups (GROUP|))|(sorted)`

Parameters

WORD	DNS host name or IP address
groups	TACACS+ server group
GROUP	Group name; if this parameter is not specified, display all groups
sorted	Sort by TACACS+ server name
vrf	management or all VRFs

Command Mode

Executive mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show tacacs-server total
number of servers:1

 Tacacs+ Server                 : 192.168.10.215/49(*)
           Sequence Number      : 1
         Failed Auth Attempts   : 0
       Success Auth Attempts    : 14
     Failed Connect Attempts    : 0
  Last Successful authentication: 2017 December 18, 12:27:13 (*)

indicates last active.
```

Table 3-26 explains the output fields.

Table 3-26: show tacacs-server output fields

Field	Description
Sequence Number	Sequence number of user authentication attempt with the TACACS+ server.
Failed Auth Attempts	Number of times user authentication failed with the TACACS+ server. Increments for server key mismatches and password mismatches or wrong password for the user.
Success Auth Attempts	Number of times user authenticated with TACACS+ server. Increments for each successful login.

Table 3-26: show tacacs-server output fields

scription
mber of failed TCP socket connections to the TACACS+ server. rements for server connection failure cases such as server not-reachable, server port mismatches.
estamp when user successfully authenticated with the TACACS+ server.

tacacs-server login host

Use this command to set the TACACS+ server host name or IP address.

Use the `no` form of this command to remove an TACACS+ server (if only a host name or IP address is specified as a parameter) or to remove all of a TACACS+ server's configuration settings (if any other parameters are also specified).

Command Syntax

```
tacacs-server login host (HOSTNAME | X:X::X:X | A.B.C.D) (vrf management|) (seq-num
<1-8> |) (key ((0 WORD) | (7 WORD) | (WORD))|) (port <1025-65535> |) no tacacs-
server login host (HOSTNAME | A.B.C.D | X:X::X:X) (vrf management|) no tacacs-
server login host (HOSTNAME | X:X::X:X | A.B.C.D) (vrf management|) (key ((0 WORD)
| (7 WORD) | (WORD))|) (port <1025-65535> |)
```

Parameters

`HOSTNAME`	Host name
`X:X::X:X`	IPv6 address
`A.B.C.D`	IPv4 address
`vrf`	Virtual Routing and Forwarding
`management`	Management VRF
`seq-num`	Sequence Number / Priority index for tacacs-servers
`key`	Authentication and encryption key ("shared secret")
`0`	Unencrypted (clear text) shared key
`WORD`	Unencrypted key value; maximum length 63 characters
`7`	Hidden shared key
`WORD`	Hidden key value; maximum length 63 characters
`WORD`	Unencrypted (clear text) shared key value; maximum length 63 characters
`port`	TACACS+ server port
`<1205-65535>`	TACACS+ server port number; the default is 49

Default

Enable authentication for TACACS+ server configured. Authorization is also enabled by default. The default server port is 49.

There is no command to enable authorization. Authorization functionality is enabled by default when remote authentication is enabled with TACACS+.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
                        (config)#tacacs-server login host 203.0.113.31 vrf management
```

tacacs-server login key

Use this command to set a global preshared key (“shared secret”) which is a text string shared between the device and TACACS+ servers.

Use the `no` form of this command to remove a global preshared key.

Command Syntax `tacacs-server login key ((0 WORD) | (7 WORD) | (WORD)) (vrf management|) no tacacs-server login key ((0 WORD) | (7 WORD) | (WORD)) (vrf management|)`

Parameters

`0` Unencrypted (clear text) shared key

`WORD` Unencrypted key value; maximum length 63 characters

`7` Hidden shared key

`WORD` Hidden key value; maximum length 63 characters

`WORD` Unencrypted (clear text) shared key value; maximum length 63 characters `vrf` Virtual Routing and Forwarding `management` Management VRF

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#tacacs-server login key 7 jvn05mlQH1 vrf management
```

CHAPTER 4 Lightweight Directory Access Protocol

This chapter describes Lightweight Directory Access Protocol (LDAP) commands.

LDAP is an protocol for accessing and maintaining distributed directory information services over an IP network. LDAP is specified is in RFC 4511.

For SWMRE, LDAP is used for authentication.

This chapter contains these commands:

- clear ldap-server statistics
- debug ldap
- feature ldap
- ldap-server deadtime
- ldap-server host
- ldap-server port
- ldap-server timeout
- show debug ldap
- show ldap-server
- show running-config ldap

clear ldap-server statistics

Use this command to reset the LDAP server statistics.

Command Syntax `clear ldap-server statistics (|HOST)`

Parameters

`HOST`	Server host name, IPv4 address, or IPv6 address; if not specified, all hosts are displayed

Command Mode

Exec mode

Examples

```
#clear ldap-server statistics
```

debug ldap

Use this command to display LDAP debugging information.

Use the `no` form of this command stop displaying LDAP debugging information.

Command Syntax

```
debug ldap (aaa-request | aaa-request-lowlevel | all | config | config-lowlevel |
  server-monitor | server-monitor-errors)

no debug ldap (aaa-request | aaa-request-lowlevel | all | config | config-lowlevel
  | server-monitor | server-monitor-errors)
```

Parameters `aaa-request` LDAP AAA requests `aaa-request-lowlevel` LDAP AAA low-level requests

`all` All

`config` LDAP configuration `config-lowlevel` LDAP low-level configuration

`server-monitor` LDAP server monitor `server-monitor-errors` LDAP server monitor errors

Command Mode

Executive mode and configure mode

Examples

```
#debug ldap
```

feature ldap

Use this command to enable LDAP on the device.

Use the `no` form of this command to disable LDAP.

Command Syntax `feature ldap no feature ldap`

Parameters

None

Command Mode

Configure mode

Examples

```
#configure terminal
(config)#feature ldap
```

ldap-server deadtime

Use this command to set the LDAP server deadtime period which is the duration for which a non-reachable server is skipped.

Use the `no` form of this command to set the LDAP server deadtime period to zero.

Command Syntax `ldap-server deadtime`

```
<1-1440> no ldap-server deadtime
<1-1440>
```

Parameters

`<1-1440>`	LDAP server deadtime period in minutes

Command Mode

Configure mode

Examples

```
#configure terminal
(config)#ldap-server deadtime 270
```

ldap-server host

Use this command to set the LDAP server host name or IP address.

Use the `no` form of this command to remove an LDAP server (if only a host name or IP address is specified as a parameter) or to remove all an LDAP server's configuration settings (if any other parameters are also specified).

Command Syntax `ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) enable-ssl ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) timeout <1-60> ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) port <1-65535> (|timeout <1-60>) ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) rootDN ROOTDN (password WORD |)`

`(port <1-65535>|) (timeout <1-60>|) ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) test rootDN ROOTDN (username`

`WORD|) (password WORD |) (idle-time <1-1440> |) no ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) no ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) enable-ssl no ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) timeout <1-60> no ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) port <1-65535> (|timeout <1-`

`60>) no ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) rootDN ROOTDN (password WORD |)`

`(port <1-65535>|) (timeout <1-60>|) no ldap-server host (HOSTNAME | A.B.C.D | X:X::X:X) test rootDN (username WORD|) password WORD |) (idle-time <1-ROOTDN 1440> |)`

Parameters

`HOSTNAME` Host name

`A.B.C.D` IPv4 address `X:X::X:X` IPv6 address

`enable-ssl` Establish an SSL session before sending a bind or search request

`timeout` Period to wait for a response from the server before the client declares a timeout failure `<1-60>` Timeout value in seconds; the default is 5 seconds `port` LDAP server port `<1-65535>` LDAP server port number; the default is 389

`rootDN` Root Designated Name (DN) for the LDAP server database

`ROOTDN` Root Designated Name value; maximum length 128 characters `password` Bind password for root

WORD Password value; maximum length 32 characters test

Verify the LDAP server state username User name used in test packets

WORD	User name value; maximum length 32 characters
password	Password used in test packets
WORD	Password value; maximum length 32 characters
idle-time	If a response is not received after this time, the server is assumed dead
<1-1440>	Idle-time value; the default is 60

Command Mode

Configure mode

Examples

```
#configure terminal
(config)#ldap-server host 203.0.113.132 timeout 10
```

ldap-server port

Use this command to set the port number on which the LDAP server listens for connections. The default port on which the LDAP server listens is 389.

You can only give this command when the LDAP server is enabled. See the feature ldap command.

USe the `no` form of this command to set the LDAP server port to its default value (389).

Command Syntax `ldap-server  port`

`<1-65535> no ldap-server port`

`<1-65535>`

Parameters

`<1-65535>`	Port number

Command Mode

Configure mode

Examples

```
#configure terminal
(config)#ldap-server port 934
```

ldap-server timeout

Use this command to set the period to wait for a response from the server before the client declares a timeout failure. The default timeout value is 5 seconds.

You can only give this command when the LDAP feature is enabled. See the feature ldap command.

Use the `no` form of this command to set the timeout value to its default value (5 seconds).

Command Syntax `ldap-server timeout <1-60> no ldap-server timeout <1-60>`

Parameters

`<1-60>`	Timeout value in seconds

Command Mode

Configure mode

Examples

```
#configure terminal
(config)#ldap-server timeout 35
```

show debug ldap

Use this command to display whether LDAP debugging is enabled.

You can only give this command when the LDAP server is enabled. See the feature ldap command.

Command Syntax `show debug ldap`

Parameters

None

Command Mode

Exec mode

Examples

```
#show debug ldap
```

show ldap-server

Use this command to display the LDAP server group configuration information.

Command Syntax `show ldap-server ((groups (GROUP|)|) | (statistics (HOST|)|))`

Parameters

`groups`	Groups
`GROUP`	Server group name; if not specified, all groups are displayed
`statistics`	Statistics
`HOST`	Server host name, IPv4 address, or IPv6 address; if not specified, all hosts are displayed

Command Mode

Exec mode

Examples

```
#show ldap-server groups
```

show running-config ldap

Use this command to display LDAP settings in the running configuration.

You can only give this command when the LDAP server is enabled. See the feature ldap command.

Command Syntax `show running-config ldap`

Parameters

None

Command Mode

Exec mode

Examples

```
#show running-config ldap
```

Security Features Configuration Guide

Contents

This guide contains these chapters:

- Chapter 1, *DHCP Snooping*
- Chapter 2, *Proxy ARP and Local Proxy ARP*
- Chapter 3 *DHCP Snooping IP Source Guard*

CHAPTER 1 DHCP Snooping

Overview

DHCP snooping is a series of techniques applied to ensure the security of an existing DHCP infrastructure. It is a security feature that acts like a fire wall between untrusted hosts and trusted DHCP servers. It is a layer-2 security technology built into the operating system of a capable network switch that drops DHCP traffic determined to be unacceptable.

The fundamental use case of DHCP snooping is to prevent unauthorized (rogue) DHCP servers offering IP addresses to DHCP clients. Rogue DHCP servers are often used in 'man-in the middle' or 'Denial of Service' attacks from malicious purpose. Similarly DHCP clients (rogue) can also cause 'Denial of Service' attacks by continuously requesting for IP addresses causing address depletion in the DHCP server.

The DHCP snooping feature performs the following activities:

- Validates DHCP messages received from un-trusted sources and filters out invalid messages.
- Rate-limits DHCP traffic from trusted and un-trusted sources.
- Builds and maintains the DHCP snooping binding database, which contains information about un-trusted hosts with leased IP addresses.
- Utilizes the DHCP snooping binding database to validate subsequent requests from un-trusted hosts.

DHCP snooping is enabled on a per-VLAN basis. By default, the feature is inactive on all VLANs. You can enable the feature on a single VLAN or a range of VLANs.

Topology

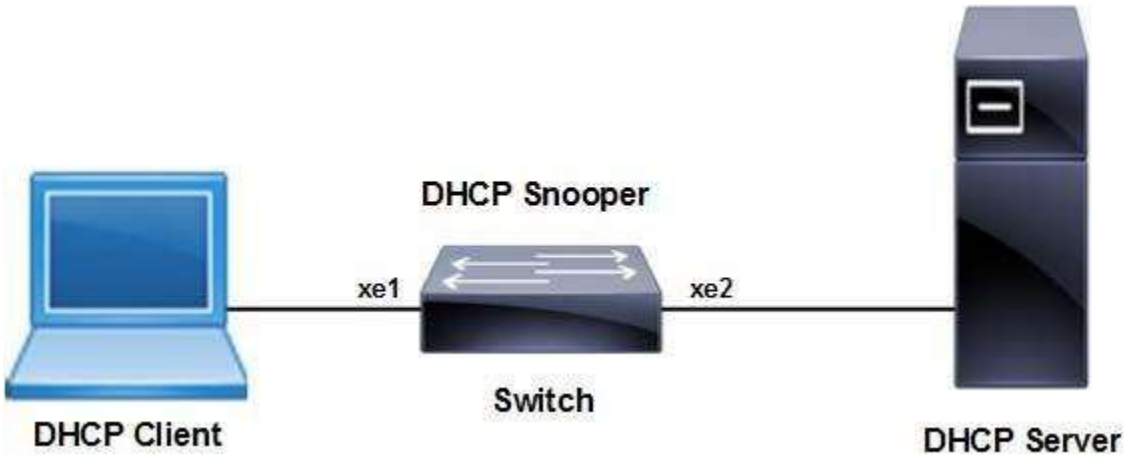

Figure 2-37: DHCP Snoop Topology

Configuration Guidelines

When configuring DHCP snooping, follow these guidelines:

DHCP Snooping

- DHCP snooping is not active until you enable the feature on at least one VLAN, and enable DHCP snooping globally on the switch.
- Before globally enabling DHCP snooping on the switch, make sure that the device acting as the DHCP server is configured and enabled.
- If a Layer 2 LAN port is connected to a DHCP server, configure the port as trusted by entering the `ip dhcp snooping trust interface` configuration command.
- If a Layer 2 LAN port is connected to a DHCP client, configure the port as un-trusted by entering the `no ip dhcp snooping trust interface` configuration command.

Procedures

The following subsections provide examples of how to enable and configure DHCP Snooping.

Enable DHCP Snooping Globally

`#configure terminal`	Enter Configure mode.
`(config)#bridge 1 protocol mstp`	Create mstp or ieee vlan-bridge.
`(config)#ip dhcp snooping bridge 1`	Enable DHCP Snooping on the bridge

Enable DHCP Snooping on a VLAN

`configure terminal`	Enter Configure mode.
`(config)#vlan 2 bridge 1`	Configure a vlan for the bridge.
`(config)#ip dhcp snooping vlan 2 bridge 1`	Enable DHCP Snooping on the vlan 2

Configuring the ports connected to DHCP server and DHCP client

`#configure terminal`	Enter the configure mode
`(config)#interface xe1`	Specify the interface xe1 to be configured, and enter the `Interface` mode
`(config-if)#switchport`	Configure the interface as a switch port.
`(config-if)#bridge-group 1`	Associate the interface `xe1` with bridge-group `1`.
`(config-if)#switchport mode access`	Configure the port as an access port
`(config-if)#switchport access vlan 2`	Bind the interface vlan 2 to the port.
`(config-if)#exit`	Exit the `Interface` mode.

(config)#interface xe2	Specify interface xe2 to be configured connected to server.
(config-if)#switchport	Configure the interface as a switch port.
(config-if)#bridge-group 1	Associate interface xe2 with bridge-group 1.

(config-if)#switchport mode access	Configure the port as an access port.
(config-if)#switchport access vlan 2	Bind the interface vlan 2 to the port.
(config-if)#exit	Exit the Interface mode.
(config)#exit	Exit the config mode.

Configuring Trusted and Un-trusted Ports

Usually the port connected to server is configured as trusted port and the ports connected to client is configured as untrusted port

In this example, xe1 is connected to the DHCP client and xe2 is connected to the DHCP server.

- Configure xe1 connected to DHCP client as un-trusted port.
- Configure xe2 connected to the DHCP server as trusted port.

#configure terminal	Enter Configure mode.
(config)#interface xe1	Specify the interface to be configured
(config-if)#no ip dhcp snooping trust	Disable the port as trusted.

DHCP Snooping Operation

1. Configure DHCP server that is connected to DHCP Snooper through trusted port.
2. Request an ip address from the DHCP client connected through the un-trusted port.
3. DHCP client broadcast the DHCP DISCOVER message to the switch.
4. DHCP server responds to the DHCP DISCOVER message with DHCP offer message to the client.
5. Once the DHCP OFFER is received by the client, it sends an DHCP REQUEST to the server.
6. DHCP server validates the request from the client and sends DHCP ACK with the offered ip address to the client with the lease time.
7. DHCP Snooper creates an entry for the above operation into the binding table which includes the MAC address of the host, the leased IP address, the lease time, the binding type, and the VLAN number and interface information associated with the host.
8. DHCP Snooper clears the entry in the binding table once the client sends the DHCP RELEASE query.

Validation

The show running-config ip dhcp snooping command displays the DHCP snooping commands configured on the device in question.

```
#show running-config ip dhcp snooping !
!
```

DHCP Snooping

```
ip dhcp snooping bridge 1 ip dhcp
snooping vlan 2 bridge 1 interface
xe2  ip dhcp snooping trust !
```

The `show ip dhcp snooping bridge 1` command displays the configured information about DHCP Snooping. `#show ip dhcp snooping bridge 1`

```
Bridge Group                                          : 1
DHCP snooping is                                      : Enabled
DHCP snooping option82 is                             : Disabled
Verification of hwaddr field is                       : Disabled
Rate limit(pps)                                       : 100
DHCP snooping is configured on following VLANs        : 2
DHCP snooping is operational on following VLANs       : 2
```

DHCP snooping trust is configured on the following Interfaces

```
Interface               Trusted --
-------------          ------xe1
No xe2                      Yes
```

The `show ip dhcp snooping binding bridge 1` command displays the binding table entries associated with un-trusted interfaces.

```
#show ip dhcp snooping binding bridge 1

Total number of static IPV4 entries : 1
Total number of dynamic IPV4 entries : 0
Total number of static IPV6 entries : 0
Total number of dynamic IPV6 entries : 0
MacAddress     IpAddress    Lease(sec)     Type                  VLAN    Interface
------------------  ---------------   ---------------- ---------------------  ---------
-  -------------

0002.a54e.c279    3.4.5.1        300           dhcp-snooping      1           xe1
```

CHAPTER 2 Proxy ARP and Local Proxy ARP

Overview

Proxy ARP (RFC 1027) is a technique by which a device on a given network answers the ARP queries for a network address that is not on that network. The Proxy ARP is aware of the location of the traffic's destination, and offers its own MAC address as destination. The captured traffic is then typically routed by the Proxy to the intended destination via another interface. Proxy ARP can help machines on a subnet reach remote subnets without the need to configure routing or a default gateway.

Use `no ip proxy-arp` to disable Proxy ARP, Proxy ARP is disabled by default.

Topology

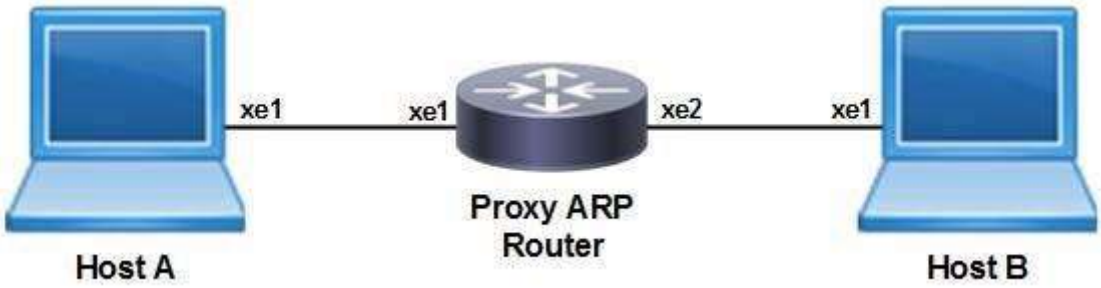

Figure 3-38: Sample topology

Host A:

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface to be configured on Host A
`(config-if)#ip address 20.20.0.2/16`	Configure the ip address on the interface
`(config)#end`	Exit interface and configure mode

Host B:

`#configure terminal`	Enter Configure mode
`(config)#interface xe1`	Specify the interface to be configured on Host B
`(config-if)#ip address 20.20.1.2/24`	Configure the ip address on the interface
`(config)#end`	Exit interface and configure mode

Enable Proxy ARP:

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface connected to Host A
`(config-if)#ip address 20.20.0.1/24`	Configure the ip address on the interface
`(config-if)#interface xe2`	Specify the interface connected to Host B
`(config-if)#ip address 20.20.1.1/24`	Configure the ip address on the interface

(config-if)#interface xe1	Specify the interface to configure Proxy ARP
(config-if)#ip proxy-arp	Enable Proxy ARP
(config)#end	Exit interface and configure mode

Validation

```
#show running-config arp
! interface xe1
ip proxy-arp !
```

The `show arp` command on the hosts shows the arp table entries to reach different subnets. Ping Host B from Host A.Host A. The ARP table should have Router's xe1 interface MAC address to reach Host B. Execute the below command at Host A.

```
#show arp

Flags: D - Static Adjacencies attached to down interface

IP ARP Table for context default
Total number of entries: 2
Address          Age          MAC Address     Interface    State
20.20.0.3       00:02:39     ecf4.bbc0.3d71       xe1       STALE.
```

Local Proxy ARP Overview

Local Proxy ARP feature is used to enable local proxy support for ARP requests per interface level. Activation will make the router answer all ARP requests on configured subnet, even for clients that should not normally need routing. Local proxy ARP means that the traffic comes in and goes out the same interface.

The local proxy ARP feature allows responding to ARP requests for IP addresses within a subnet where normally no routing is required. With the local proxy ARP feature enabled, ARP responds to all ARP requests for IP addresses within the subnet and forwards all traffic between hosts in the subnet. Use this feature only on subnets where hosts are intentionally prevented from communicating directly.

Topology

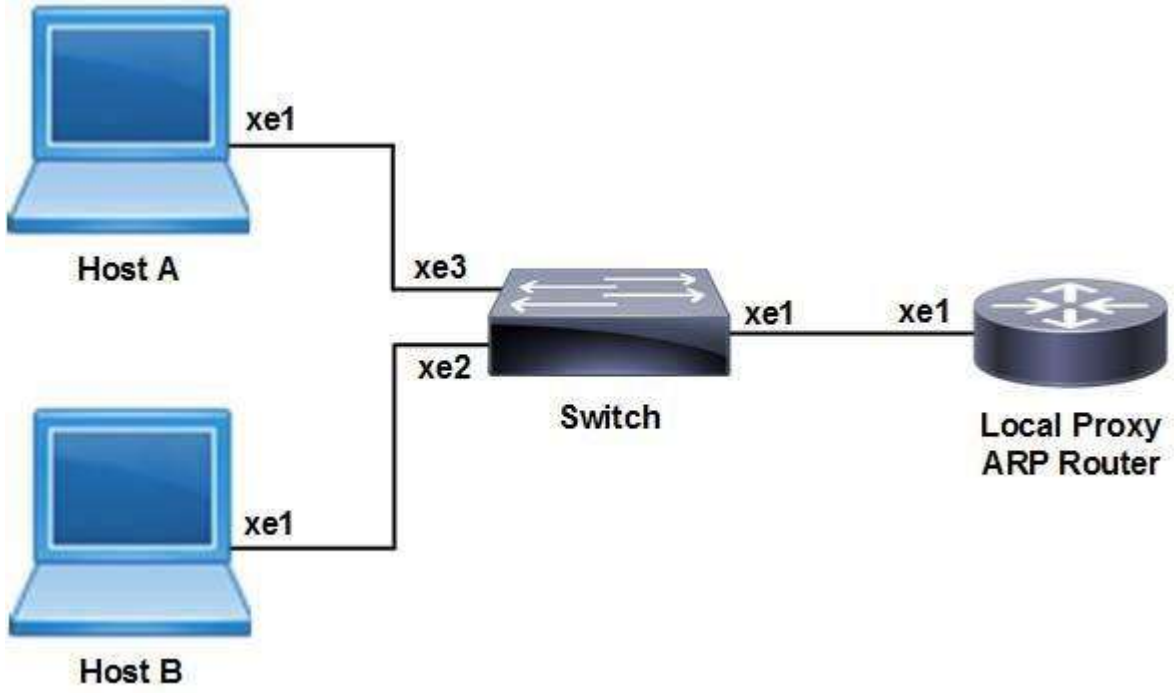

Figure 3-39: Sample topology

Host A:

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface to be configured on Host A
`(config-if)#ip address 20.20.0.2/16`	Configure the ip address on the interface
`(config)#end`	Exit interface and configure mode

Host B:

`#configure terminal`	Enter Configure mode
`(config)#interface xe1`	Specify the interface to be configured on Host B
`(config-if)#ip address 20.20.0.3/24`	Configure the ip address on the interface
`(config)#end`	Exit interface and configure mode

Private Vlan Configuration on Switch:

`#configure terminal`	Enter Configure mode.
`(config)# bridge 1 protocol ieee vlan-bridge`	Create ieee vlan-bridge on switch for pvlan configuration
`(config)# vlan database`	Enter into the vlan database
`(config-vlan)# vlan 100-101 bridge 1 state enable`	Create vlans 100 and 101 as part of bridge 1
`(config-vlan)# private-vlan 100 primary bridge 1`	Configure vlan 100 as a primary vlan
`(config-vlan)# private-vlan 101 isolated bridge 1`	Configure vlan 101 as a isolated vlan
`(config-vlan)# private-vlan 100 association add 101 bridge 1`	Associate secondary vlan 101 to primary vlan 100

(config-vlan)#exit	Exit from the vlan database
(config)#interface xe1	Specify the interface to be configured
(config-if)#switchport	Configure xe1 as a layer2 interface.
(config-if)#bridge-group 1	Associate the interface to the bridge
(config-if)#switchport access vlan 100	Associate primary vlan to the interface
(config-if)#switchport mode private-vlan promiscuous	Configure xe1 interface as a promiscuous port
(config-if)# switchport private-vlan mapping 100 add 101	Associate primary vlan 100 and secondary vlan 101 to a promiscuous port
(config-if)# exit	Exit interface mode
(config)#interface xe2	Specify the interface to be configured
(config-if)#switchport	Configure xe2 as a layer2 interface.
(config-if)#bridge-group 1	Associate the interface to the bridge
(config-if)#switchport access vlan 100	Associate primary vlan to the interface
(config-if)#switchport mode private-vlan promiscuous	Configure xe2 interface as a promiscuous port
(config-if)# switchport private-vlan mapping 100 add 101	Associate primary vlan 100 and secondary vlan 101 to a promiscuous port
(config-if)# exit	Exit interface mode
(config)#interface xe3	Specify the interface to be configured
(config-if)#switchport	Configure xe3 as a layer2 interface.
(config-if)#bridge-group 1	Associate the interface to the bridge
(config-if)#switchport access vlan 100	Associate primary vlan to the interface
(config-if)#switchport mode private-vlan promiscuous	Configure xe2 interface as a promiscuous port
(config-if)# switchport private-vlan mapping 100 add 101	Associate primary vlan 100 and secondary vlan 101 to a promiscuous port
(config-if)# exit	Exit interface mode

Enable Local Proxy ARP on Router:

#configure terminal	Enter Configure mode
(config)#interface xe1	Specify the interface to be configured on Host B
(config-if)#ip address 20.20.0.3/24	Configure the ip address on the interface
(config-if)#ip local-proxy-arp	Enable Local Proxy ARP
(config)#end	Exit interface and configure mode

Validation

ARP cache on Host A and Host B

The show arp command on hosts shows the arp table entries to reach different subnets. Ping Host B from Host A.Host A ARP table should have Router's xe1 interface MAC address to reach Host B. Execute the below command at Host A.

```
#show arp

Flags: D - Static Adjacencies attached to down interface

IP ARP Table for context default
Total number of entries: 2
Address          Age          MAC Address     Interface    State 20.20.0.3
00:02:39      ecf4.bbc0.3d71      xe1       STALE.
```

CHAPTER 3 DHCP Snooping IP Source Guard

Overview

IPSG is a security feature that restricts IP traffic on non-routed, Layer 2 interfaces by filtering traffic based on the DHCP snooping binding database and on manually configured IP source bindings. Use IP source guard to prevent traffic attacks if a host tries to use the IP address of its neighbor.

Enable IP source guard when DHCP snooping is enabled on an untrusted interface. After IPSG is enabled on an interface, the switch blocks all IP traffic received on the interface except for DHCP packets allowed by DHCP snooping. A port access control list (ACL) is applied to the interface. The port ACL allows only IP traffic with a source IP address in the IP source binding table and denies all other traffic.

Topology

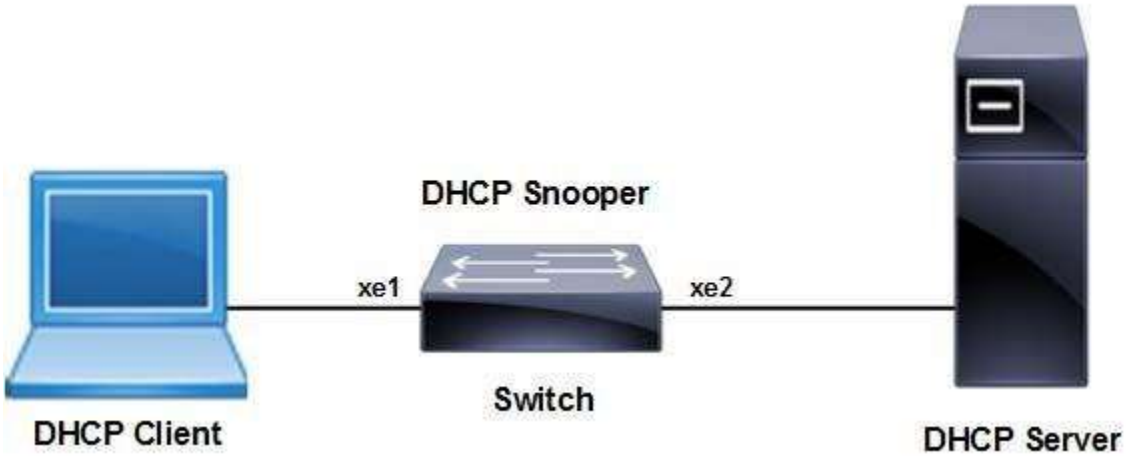

Figure 4-40: IP Source Guard Topology

Configuring the Switch

`#configure terminal`	Enter the configure mode
`(config)#bridge 1 protocol ieee vlan-bridge`	Create IEEE VLAN bridge 1.
`(config)#vlan 2 bridge 1 state enable`	Create VLAN 2.
`(config)# ip dhcp snooping bridge 1`	Configure DHCP snooping for bridge 1
`(config)# ip dhcp snooping information option bridge 1`	Configure DHCP snooping information option 82
`(config)# ip dhcp snooping ratelimit 0`	Configure DHCP snooping ratelimit. Default value is 100
`(config)# ip dhcp snooping vlan 2 bridge 1`	Configure DHCP snooping for vlan 2 for bridge 1

(config)# ip dhcp snooping verify macaddress bridge 1	Configure DHCP snooping verify mac-address
(config)#interface xe2	Enter Interface Mode
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode access	Set the Layer2 interface as Access. (It can be Trunk mode also)
(config-if)#switchport access vlan 2	Set the default VLAN for the interface
(config-if)#ip dhcp snooping trust	Configuring the interface as Trust. Basically this is configured on the interface which is connected to Server Side.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter Interface Mode
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode access	Set the Layer2 interface as Access. (It can be Trunk mode also)
(config-if)#switchport access vlan 2	Set the default VLAN for the interface
(config-if)#ip verify source dhcp-snoopingvlan	Configuring IP source guard at Interface level and configured on the interface which is connected to client side
(config-if)#ip verify source access-group mode merge	Merge IPSG policy with other ACL
(config-if)#exit	Exit interface mode
(config)#ip dhcp snooping binding bridge 1 0011.1111.2222 2 ipv4 1.1.1.1 xe1	Configure Ipv4 Static Entry For DHCP snooping with MAC address and Source Address for an interface and vlan configured
(config)#ip dhcp snooping binding bridge 1 0022.2222.3333 2 ipv6 3ffe::1 xe1	Configure Ipv6 Static Entry For DHCP snooping with MAC address and Source Address for an interface and vlan configured
(config)#ip source binding ipv4 1.1.1.1 0011.1111.2222 vlan 2 interface xe1 bridge 1	Configure static IP source guard entry for ipv4 entries
(config)#ip source binding ipv6 3ffe::2 0022.2222.3333 vlan 2 interface xe1 bridge 1	Configure static IP source guard entry for ipv6 entries
(config)#exit	Exit config mode
#clear ip dhcp snooping binding bridge 1	Clear DHCP binding tables which are learned dynamically

Configuring Trusted and Un-trusted Ports

Usually the port connected to server is configured as trusted port and the ports connected to client is configured as untrusted port

In this example, xe1 is connected to the DHCP client and xe2 is connected to the DHCP server.

- Configure xe1 connected to DHCP client as un-trusted port.
- Configure xe2 connected to the DHCP server as trusted port.

#configure terminal	Enter Configure mode.
(config)#interface xe1	Specify the interface to be configured
(config-if)#no ip dhcp snooping trust	Disable the port as trusted.
(config-if)#exit	Exit interface mode
(config)#interface xe2	Specify the interface to be configured
(config-if)#ip dhcp snooping trust	Enable the port as trusted.
(config-if)#exit	Exit interface mode

Configuring IP Source Guard on LAG Port

#configure terminal	Enter the configure mode
(config)#interface xe2	Enter Interface Mode
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode access	Set the Layer2 interface as Access. (It can be Trunk mode also)
(config-if)#switchport access vlan 2	Set the default VLAN for the interface
(config-if)#ip dhcp snooping trust	Configuring the interface as Trust. Basically this is configured on the interface which is connected to Server Side.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter Interface Mode
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode access	Set the Layer2 interface as Access. (It can be Trunk mode also)
(config-if)#switchport access vlan 2	Set the default VLAN for the interface
(config-if)#static-channel-group 2	Configure Static Channel lag on the interface
(config-if)#exit	Exit interface mode
(config)#interface sa1	Enter Interface Mode
(config-if)#ip verify source dhcp-snoopingvlan	Configuring IP source guard at Interface level and configured on the interface which is connected to client side
(config-if)#ip verify source access-group mode merge	Merge IPSG policy with other ACL
(config-if)#exit	Exit interface mode
(config)#ip dhcp snooping binding bridge 1 0011.1111.2222 2 ipv4 1.1.1.1 sa1	Configure Ipv4 Static Entry For DHCP snooping with MAC address and Source Address for lag interface and vlan configured
(config)#ip dhcp snooping binding bridge 1 0022.2222.3333 2 ipv6 3ffe::1 sa1	Configure Ipv6 Static Entry For DHCP snooping with MAC address and Source Address for lag interface and vlan configured

(config)#ip source binding ipv4 1.1.1.1 0011.1111.2222 vlan 2 interface sa1 bridge 1	Configure static IP source guard entry for ipv4 entries with lag interface
(config)#ip source binding ipv6 3ffe::2 0022.2222.3333 vlan 2 interface sa1 bridge 1	Configure static IP source guard entry for ipv6 entries with lag interface
(config)#exit	Exit config mode
#clear ip dhcp snooping binding bridge 1	Clear DHCP binding tables which are learned dynamically

Validation

Verify the dhcp snooping is enabled on the bridge

```
#sh ip dhcp snooping bridge 1
Bridge Group                                          : 1
DHCP snooping is                                      : Enabled
DHCP snooping option82 is                             : Enabled
Verification of hwaddr field is                       : Enabled
Rate limit (pps)                                      : 0
DHCP snooping is configured on following VLANs        : 2
DHCP snooping is operational on following VLANs       : 2
DHCP snooping trust is configured on the following Interfaces
Interface               Trusted -----
----------          ------xe2
Yes
DHCP snooping IP Source Guard is configured on the following Interfaces
Interface               Source Guard -----
----------          -----------xe1
Yes
```

Verify the static dhcp snooping entries configured for the bridge

```
#sh ip dhcp snooping binding bridge 1
Total number of static IPV4 entries                    : 1
Total number of dynamic IPV4 entries                   : 0
Total number of static IPV6 entries                    : 1
Total number of dynamic IPV6 entries                   : 0

MacAddress           IpAddress         Lease(sec) Type            VLAN   Interface
------------------   ---------------   ---------- -------------   ----   ---------------
0011.1111.2222       1.1.1.1           0          static          2      xe1
0022.2222.3333       3ffe::1           0          static          2      xe1
```

Verify the static IP dhcp snooping source guard entries configured for the bridge

```
#sh ip dhcp snooping source binding bridge 1
Total number of static source IPV4 entries             : 1
Total number of static source IPV6 entries             : 1
MacAddress           IpAddress         Lease (sec) Type            VLAN   Interface ------
------------   ---------------   ---------- -------------   ----   --------------
----
```

```
 0011.1111.2222       1.1.1.1           0         static           2     xe1
 0022.2222.3333       3ffe::2           0         static           2     xe1
```

Verify the dhcp snooping is enabled on the bridge with static lag interface

```
#sh ip dhcp snooping bridge 1
Bridge Group                                          : 1
DHCP snooping is                                      : Enabled
DHCP snooping option82 is                             : Enabled
Verification of hwaddr field is                       : Enabled
Rate limit(pps)                                       : 0
DHCP snooping is configured on following VLANs        : 2
DHCP snooping is operational on following VLANs       : 2
DHCP snooping trust is configured on the following Interfaces
Interface                Trusted

```

SECTION 4 System Configuration

Hybrid Switch Router Configuration Guide

Contents

This guide contains these chapters:

- Chapter 1, *Hybrid Switching Overview*
- Chapter 2, *Hybrid Switch Router Configuration*

CHAPTER 1 Hybrid Switching Overview

An SWMRE Hybrid Switch Router offers Layer 3 forwarding found in routers with the high-speed performance associated with traditional Layer 2 switches. The following are some advantages of Hybrid Switch Routers:

- Reduced system cost and infrastructure. Traditionally you would require a separate box for switching and one for routing.
- Off-loading IP traffic from backbone routers, thus making them more efficient for firewalls and WAN connectivity.
- Simplified network design and maintenance.

Routing and Switching

Layer 2 and Layer 3 switches are similar at a high-level, both look at the packet headers, and steer the packets toward their destination port. Therefore, after being passed through a switch or router, the packet is closer to its destination.

Layer 2 Switching

Layer 2 switches are typically used to provide connectivity within high bandwidth local area networks (LANs). A Layer 2 switch makes forwarding decisions based on the MAC or the Layer 2 header. It extracts the Layer 2 header from the packet, finds a matching destination address in the forwarding table, and transmits the packet out to the port associated with the specific destination address in the forwarding table. The forwarding table is populated through a self-learning process, whereby each arriving packet is used to update the entries in the table. Typically, the Layer 2 switch implements the switching function in the hardware, as that requires stripping of the packet only in two layers (the physical and data link layer) to get to the useful part of the packet header. This allows switches to steer packets at wirespeed rates without slowing down arriving streams of packets to process them.

Layer 3 Routing

Layer 3 (L3) routers are typically used to provide connectivity between different LANs. A Layer 3 router discards MAC headers, and indexes further into the packet–making decisions based on the IP or Layer 3 header. It extracts the Layer-3 header from the packet, finds a matching destination address in a routing table, identifies a new MAC address for the packet from an ARP cache, wraps the IP packet in a new MAC header, and then transmits the packet out to the port associated with that destination address in the routing table.

The routing table is populated through statically configured command line interface entries or through routing protocol messages from neighboring routers. A Layer 3 router must strip through 3 layers (physical, data link, and network) which is more complicated than a Layer 2 switch. Layer 3 routers historically implement the routing function in software. This often results in limited packet-forwarding rates. However, improvements in VLSI circuit technology have allowed Layer 3 routing functions to be implemented rapidly in hardware, enabling wire-speed performance similar to the performance of Layer 2 switches. As a result, along with the complexity of next-generation Layer 3 routers, the throughput of these routers has also been increasing.

An architecture is required that is flexible enough to accommodate the demands of different customers, and accommodate the changing demands of a single customer whose requirements may change over time. Typical Layer 2 switches and Layer 3 routers fail to provide this flexibility.

An optimal configuration can be an integrated solution, a Layer 3 router with Layer 2 bridge groups around it. The SWMRE Hybrid Switch Router implementation allows easy configuration of different combinations of routers and switches. SWMRE can be configured as an absolute Layer 3 router, absolute Layer 2 switch (Figure 1-41) or a hybrid Layer 2/Layer 3 switch router, (Figure 1-42) that can easily change modes with the use of a single command.

Hybrid Switching Overview

System Configuration

- SWMRE stack will bring up all the ports of the board as routed ports by default.
- However SWMRE provides flexibility to create a Layer 2 bridge, and ports can be converted to switch ports and added to the bridge.
- SWMRE also supports VLAN interfaces and routing between VLANs.

Thus it can work as a router, a switch, or as a hybrid switch.

Hybrid Switch Router Possibilities

With only Layer 2 protocols configured, the SWMRE Hybrid Switch Router can become an absolute Layer 2 switch.

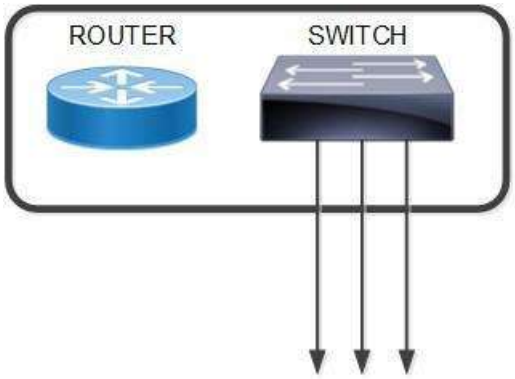

Figure 1-41: Layer 2 Switch

With Layer 2 and Layer 3 protocols configured, the SWMRE Hybrid Switch Router can become a Switch and/or a Router.

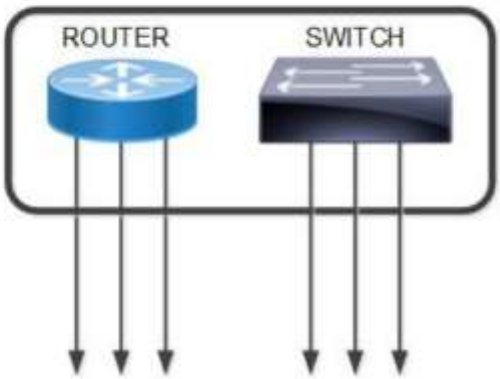

Figure 1-42: Working as a Router or a Switch

Hybrid Switching Overview

With only Layer 3 protocols enabled, the SWMRE Hybrid Switch Router can become an absolute router.

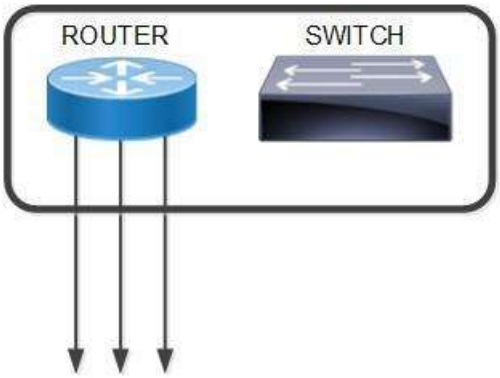

Figure 1-43: Working as Layer 3

Router On switch ports, VLANs can be created for different broadcast domains.

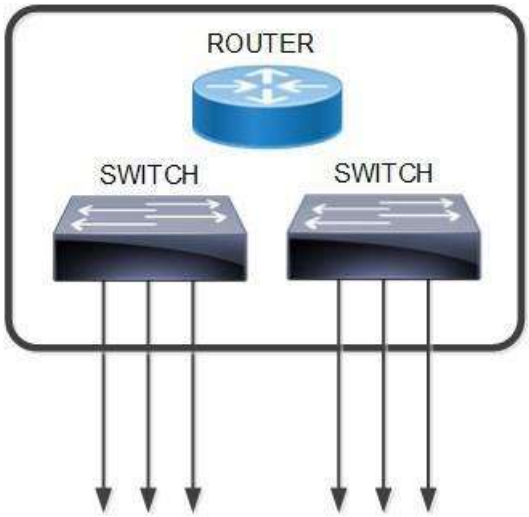

Figure 1-44: Port- or Policy-based VLANs

For routing between VLANs, the SWMRE routing protocols or static routing via NSM can be utilized.

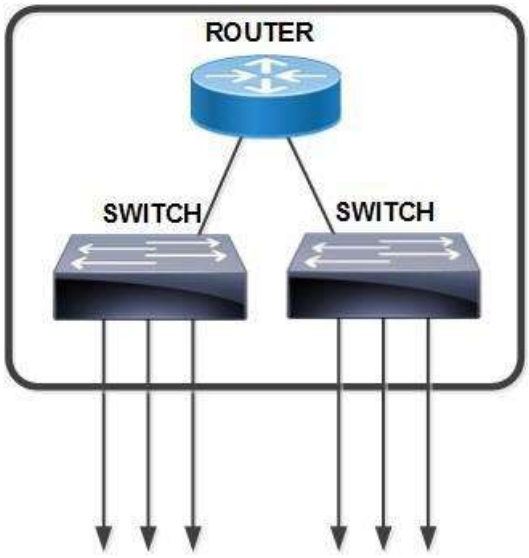

Figure 1-45: Routing between VLANs

For routing between VLANs and other routing ports, SWMRE routing protocols or static routing via NSM can be utilized.

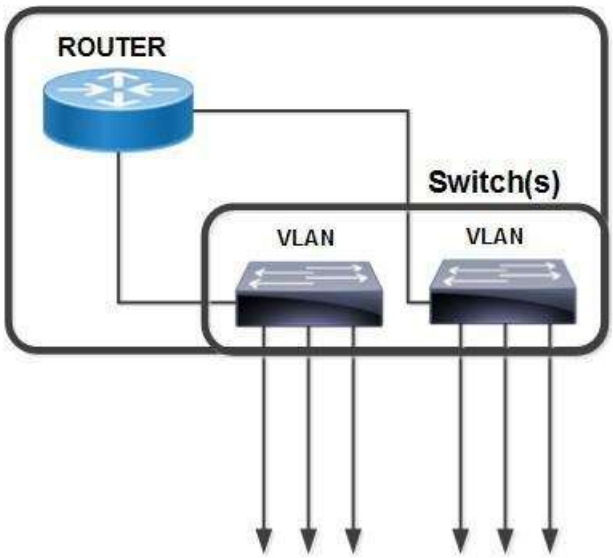

Figure 1-46: Routing between VLANs and Routing Ports

CHAPTER 2 Hybrid Switch Router Configuration

This chapter describes various configurations that can be done with the Hybrid Switch Router solution. SWMRE can be configured as a Layer 2 switch, a Layer 3 router or a Hybrid Switch Router.

Configuring a Hybrid Switch Router

When a port changes from a switched port to a routed port, an `Interface Delete` message is sent to the Layer 2 protocols and an `Interface Add` message is sent to the Layer 3 protocols. The following figure shows the port, changing from a switched port to routed port:

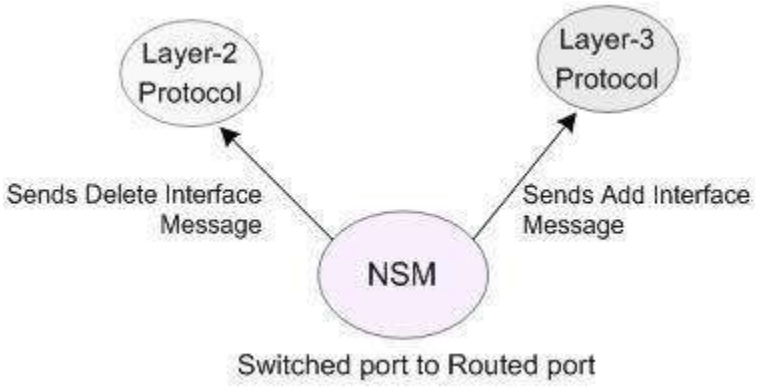

Figure 2-47: Switched Port to Routed Port

When a port changes from a routed port to a switched port, an `Interface Delete` message is sent to the Layer 3 protocols and an `Interface Add` message is sent to the Layer 2 protocols. In this case, all properties of the Layer 3 interfaces are deleted: for instance, this interface is deleted from all Layer 3 management, all routes pointing to this interface are invalidated, and IP addresses are deleted.

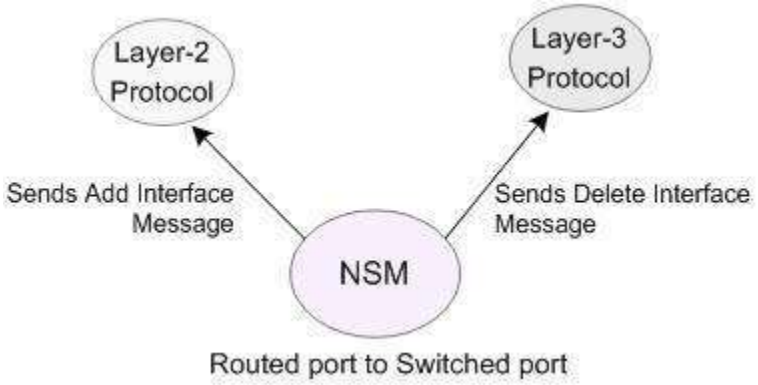

Figure 2-48: Routed Port to Switched Port

Configuring Layer 2 Interfaces

For the Hybrid Switch Router, it is important to understand that by default, all interfaces are configured as routed interfaces. To configure a Layer 2 interface (switched interface), you must explicitly configure this using the `switchport` command in the interface mode. For example:

Hybrid Switch Router Configuration

`#configure terminal`	Enter the Configure mode.
`(config)#bridge 1 protocol mstp`	Create a MSTP bridge.

(config)#interface eth2	Specify an interface to configure and enter the Interface mode.
(config-if)#switchport	Configure eth2 as a Layer 2 port.
(config-if)#bridge-group 1	Associate interface to bridge 1.
(config-if)#no shutdown	Start interface.eth2

Configuring Layer 3 Interfaces

For the Hybrid Switch Router, it is important to understand that by default, all interfaces in SWMRE are L3 ports. If a port has been configured as L2, then use the `no switchport` command to make it a L3 port.

For example:

#configure terminal	Enter the Configure mode.
(config)#interface eth3	Specify an interface to configure and enter the Interface mode.
(config-if)#no switchport	Configure eth3 as a Layer 3 port.

In the Hybrid Switch Router mode, if a VLAN is configured, a Layer 3 interface based on the bridge-group number and VLAN ID is created. This Layer 3 interface is advertised to all the Layer 3 protocols. For example:

#configure terminal	Enter the Configure mode.
(config)#bridge 1 protocol mstp	Creating bridge.
(config)#vlan database	Enter the VLAN configuration mode.
(config-vlan)#vlan 2 bridge 1	Enable VLAN 2 on bridge 1.

The last step in the example above show an interface given a name with the following format:

```
vlanXX.YYYY
```

Where `XX` is the bridge ID, and `YYYY` is the VLAN ID,

For example, the name, `vlan1.3` indicates that VLAN IP's interface is in VLAN 3, and bridge-group 1.

Integrated Management Interface Command Reference

Contents

This document contains these chapters:

CHAPTER 1 Common IMI Commands

This chapter describes common Integration Management Interface (IMI) commands.

- banner motd
- configure terminal
- configure terminal force
- copy running-config startup-config
- disable
- enable
- enable password
- end
- exec-timeout
- exit
- help
- history
- hostname
- line console
- line vty
- logging cli
- logout • quit
- reload
- service advanced-vty
- service password-encryption
- service terminal-length
- show clock
- show cli history
- show logging cli
- show process
- show running-config
- show running-config access-list
- show running-config as-path access-list
- show running-config community-list
- show running-config interface igmp
- show running-config interface multicast
- show running-config prefix-list
- show running-config vrf
- show tcp

- show users
- terminal length
- terminal monitor
- write

© Symanitron Proprietary

banner motd

Use this command to set the message of the day (motd) at login.

After giving this command, you must write to memory using the write command. If you do not write to memory, the new message of the day is not available after the device reboots. Use the `no` parameter to not display a banner message at login.

Command Syntax `banner`

```
motd LINE banner motd
default no banner motd
```

Parameters

`LINE` Custom message of the day. `default` Default message of the day.

Default

By default, the following banner is displayed after logging in:

```
SWMRE version 1.3.4.268-DC-MPLS-ZEBM 09/27/2018 13:44:22
```

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#banner motd default

#configure terminal
(config)#no banner motd
```

configure terminal

Use this command to enter configure mode.

Command Syntax `configure terminal`

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following example shows entering configure mode (note the change in the command prompt).

```
#configure terminal
(config)#
```

configure terminal force

Use the configure terminal force command to kick out the configure command mode to privileged EXEC mode, iff there is any session already in configure command mode.

Note: Configure terminal force with option 0 or without any option indicates immediate kick out the session which is locked to configure command mode. similarly, configure terminal force with option of any value indicates session locked to configure command mode will be exited to privileged Exec mode after the specified number of seconds completed.

Command Syntax `configure terminal force <0-600|>`

Parameters

`<0-600>`	Timeout value in seconds for the session in config mode to exit to Privileged

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal force 0
(config)#
```

copy running-config startup-config

Use this command to a write the configuration to the file used at startup. This is the same as the write command.

Command Syntax `copy running-config startup-config`

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#copy running-config startup-config
Building configuration...
[OK]
#
```

disable

Use this command from to exit privileged exec mode and return to exec mode. This is the only command that allows you to go back to exec mode. The exit or quit commands in privileged exec mode end the session without returning to exec mode.

Command Syntax `disable`

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#disable
>
```

enable

Use this command to enter privileged exec command mode.

Command Syntax `enable`

Parameters

None

Default

No default value is specified

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following example shows entering the Privileged Exec mode (note the change in the command prompt).

```
>enable
#
```

enable password

Use this command to change or create a password to use when entering enable mode.

Note: Only network administrators can execute this command. For more, see the username command.

There are three methods to enable a password:

Plain Password

The plain password is a clear text string that appears in the configuration file as configured.

Encrypted Password

An encrypted password encrypts a password. First, use this command to create a password. Then, use the service password-encryption command to encrypt the password. An encrypted password does not display in the configuration file; instead, it displays the encrypted string.

Hidden Password

A hidden password also encrypts a password; however, you do not need the service password-encryption command for this method. Use this method if you know the encrypted string of the plain text string that you want to use as a password. The output in the configuration file displays only the encrypted string and not the text string.

Use the `no` parameter to disable the password.

Command Syntax `enable password`

```
(8|) LINE no enable password
no enable password LINE
```

Parameters

`8`	Hidden password.
`line`	Password string, up to 80-characters, including spaces. The string cannot begin with a number.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#enable password mypasswd
```

end

Use this command to return to privileged exec command mode from any other advanced command mode.

Command Syntax `end`

Parameters

None

Default

No default value is specified

Command Mode

All command modes

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following example shows returning to privileged exec mode directly from interface mode.

```
#configure terminal
(config)#interface eth0
(config-if)#end
#
```

exec-timeout

Use this command to set the interval the command interpreter waits for user input detected. That is, this sets the time a telnet session waits for an idle VTY session before it times out. A value of zero minutes and zero seconds (0 and 0) causes the session to wait indefinitely.

Use the `no` parameter to disable the wait interval.

Command Syntax `exec-timeout <0-35791> (<0-2147483>|) no exec-timeout`

Parameters

`<0-35791>`	Timeout value in minutes.

<0-2147483>Timeout value in seconds.

Default

No default value is specified

Command Mode

Line mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

In the following example, the telnet session will timeout after 2 minutes, 30 seconds if there is no response from the user.

```
Router#configure terminal
Router(config)#line vty 23 66
Router(config-line)#exec-timeout 2 30
```

exit

Use this command to exit the current mode and return to the previous mode. When used in exec mode or privileged exec mode, this command terminates the session.

Command Syntax `exit`

Parameters

None

Default

No default value is specified

Command Mode

All command modes

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following example shows exiting interface mode and returning to configure mode.

```
#configure terminal
(config)#interface eth0
(config-if)#exit
(config)#
```

help

Use this command to display help for the SWMRE command line interface.

Command Syntax `help`

Parameters

None

Default

No default value is specified

Command Mode

All command modes

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#help
CLI provides advanced help feature. When you need help, anytime at
the command line please press '?'.

If nothing matches, the help list will be empty and you must backup
until entering a '?' shows the available options.
Two styles of help are provided:
1.     Full help is available when you are ready to enter a   command argument
(e.g. 'show ?') and describes each possible    argument.
2.     Partial help is provided when an abbreviated argument is entered   and
you want to know what arguments match the input    (e.g. 'show ve?'.)
```

history

Use this command to set the maximum number of commands stored in the command history.

Use the `no` parameter to remove the configuration.

Command Syntax `history max <0-2147483647> no history max`

Parameters

`<0-2147483647>` Number of commands.

Default

No default value is specified

Command Mode

Line mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#line vty 12 77
(config-line)#history max 123

(config-line)#no history max
```

hostname

Use this command to set the network name for the device. SWMRE uses this name in system prompts and default configuration filenames.

Setting a host name using this command also sets the host name in the kernel.

Note: After giving the `hostname` command, you must write to memory using the write command. If you do not write to memory, the change made by this command (the new host name) is not set after the device reboots.

Use the `no` parameter to disable this function.

Command Syntax `hostname`

```
WORD    no    hostname
(WORD|)
```

Parameter

`WORD`	Network name for a system. Per RFC 952 and RFC 1123, a host name string can contain only the special characters period (“.”) and hyphen (“-”). These special characters cannot be at the start or end of a host name.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#hostname ABC
(config)#

(config)#no hostname
(config)#exit
```

line console

Use the this command to move or change to the line console mode.

Command Syntax `line console <0-0>`

Parameters

<0-0>	First line number.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

This example enters line mode (note the change in the prompt).

```
#configure terminal
(config)#line console 0
(config-line)#
```

line vty

Use this command to move or change to VTY mode. This command is used to connect to a protocol daemon. This configuration is necessary for any session. This configuration should be in the daemon's config file before starting the daemon.

Use the `no` parameter to disable this command.

Command Syntax `line vty <0-871> (<0-871>|) no line vty <0-871> (<0-871>|)`

Parameters

<0-871>	Specify the first line number.
<0-871>	Specify the last line number.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following example shows entering line mode (note the change in the prompt).

```
#configure terminal
(config)#line vty 9
```

```
(config-line)#exit
(config)no line vty 9
```

logging cli

Use this command to enable logging commands entered by all users.

Use the `no` parameter to disable logging commands entered by all users.

Command Syntax `logging cli no logging cli`

Parameter

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.

Example

```
#configure terminal
(config)#logging cli
(config)#no logging cli
```

logout

Use this command to exit from the shell from any exec mode.

Command Syntax `logout`

Parameters

None

Default

No default value is specified

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following examples show the use of `logout` command.

```
>logout SWMRE login:
```

```
>enable en#logout >
```

quit

Use this command to exit the current mode and return to the previous mode. When this command is executed in one of the exec modes, it closes the shell and logs you out.

Command Syntax `quit`

Parameters

None

Default

No default value is specified

Command Mode

All modes

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#quit
(config)#

>enable
#quit
[root@TSUP-123 sbin]#
```

reload

Use this command to shut down the device and perform a cold restart. You call this command when:

- You detect a configuration issue such as `show running-config` displaying a configuration but when you try to remove that configuration, you get a message that it is not configured.
- You have replaced the start-up configuration file (in this case you specify the `flush-db` parameter).

Command Syntax `reload`

```
(flush-db|)
```

Parameters

`flush-db`	Delete the database file and recreate it from the start-up configuration file.

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced in SWMRE version 1.3.4.

Example

This example shows replacing a start-up configuration file and then synchronizing it to the configuration database:

```
#copy file /home/TEST.conf startup-config
Copy Success
#
#reload flush-db
The system has unsaved changes.
Would you like to save them now? (y/n): n

Configuration Not Saved!
Are you sure you would like to reset the system? (y/n): y
```

For both of these prompts, you must specify whether to save or discard the changes. Abnormal termination of the session without these inputs can impact the system behavior.

For the `unsaved changes` prompt:

`Would you like to save them now?`

You should always say “no” to this prompt because otherwise the command takes the current *running configuration* and applies it to the current start-up configuration.

service advanced-vty

Use this command to set multiple options to list when the tab key is pressed while entering a command. This feature applies to commands with more than one option.

Use the `no` parameter to not list options when the tab key is pressed while entering a command.

Command Syntax		
`service advanced-vty`	`no`	`service advanced-vty`

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#service advanced-vty
(config)#no service advanced-vty
```

service password-encryption

Use this command to encrypt passwords created with the enable password command. Encryption helps prevent observers from reading passwords.

Use the `no` parameter to disable this feature.

Command Syntax `service password-encryption` `no service password-encryption`

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#enable password mypasswd
(config)#service password-encryption
```

service terminal-length

Use this command to set the number of lines that display at one time on the screen for the current terminal session.

Use the `no` parameter to disable this feature.

Command Syntax `service terminal-length <0-512> no service terminal-length (<0-512>|)`

Parameters

`<0-512>`	Number of lines to display. A value of 0 prevents pauses between screens of output.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#service terminal-length 60
```

show clock

Use this command to display the current system time.

Command Syntax `show clock`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show clock
12:54:02 IST Fri Apr 29 2016
```

show cli history

Use this command to list the commands entered in the current session. The history buffer is cleared automatically upon reboot.

Command Syntax `show cli history`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show cli history
1 en
2 show ru
3 con t
4 show spanning-tree
5 exit
```

show logging cli

Use this command to display command history for all users.

Command Syntax `show logging cli ((logfile LOGFILENAME)|) (match-pattern WORD |) show logging cli last <1-9999> show logging logfile list`

Parameters

`LOGFILENAME` Name of a saved command history log file. The default path is `/var/log/messages`, but you can specify a full path to override the default.

`WORD` Display only lines with this search pattern.

`<1-9999>` Number of lines to display from the end of the command history. `logfile list`

Display a list of command history files.

Default

LOGFILENAME Name of a saved command history log file. The default path is /var/log/messages, but you can specify a full path to override the default.

Command Mode

Exec mode

Applicability

This command was introduced in SWMRE version 1.3.

Example

```
#sh logging cli
2017 Mar 01 16:30:59 : SWMRE : User root@/dev/pts/1 : CLI : exit

show process

Use this command to display the SWMRE daemon processes that are running.

Command Syntax `show process`

Parameters

None

Command Mode

Exec modes

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show process
 PID NAME             TIME    FD
1 nsm          00:56:29    7
2 ripd         00:56:29    11
3 ripngd       00:56:29    12
4 ospfd        00:56:29    9
5 ospf6d       00:56:29    10
6 bgpd         00:56:29    14
   9 isisd        00:56:29    8
#
```

Table 1-27 explains the output fields.

Table 1-27: show process fields

Entry	Description
PID Name	Process identifier name.
TIME	(S)—Number of system and user CPU seconds that the process has used. (None, D, and E)—Total amount of time that the command has been running.
FD	The Flexible Data-Rates (FD) of the interface.

show running-config

Use this command to show the running system status and configuration.

Command Syntax `show running-config show running-config full`

Parameters `full` Display the full configuration information.

Command Mode

Privileged exec mode and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
    (config)#show running-config no service password-encryption
    ! no service dhcp ip domain-lookup
!
    mpls propagate-ttl
    ! vrrp vmac enable spanning-tree mode provider-rstp no data-
    center-bridging enable
    ! interface lo  ip address 127.0.0.1/8  ipv6 address
    ::1/128  no shutdown
    ! interface eth0  ip address 10.1.2.173/24  no shutdown
    ! interface eth1  shutdown

    ! line con 0  login
    ! end (config)#
```

show running-config access-list

Use this command to show the running system status and configuration details for access lists.

Command Syntax `show running-config access-list`

Parameters

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
    (config)#show running-config access-list
    ! access-list abc remark annai access-list
    abc deny any access-list abd deny any
!
```

#

show running-config as-path access-list

Use this command to show the running system status and configuration details for access lists based on autonomous system paths.

Command Syntax `show running-config as-path access-list`

Parameters

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
(config)#show running-config as-path access-list
!
ip as-path access-list wer permit knsmk
!
(config)#
```

show running-config community-list

Use this command to show the running system status and configuration details for community lists.

Command Syntax `show running-config community-list`

Parameters

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
(config)#show running-config community-list
! ip community-list standard aspd permit internet ip
community-list expanded cspd deny ljj ip community-list
expanded cspd permit dcv ip community-list expanded wde
permit njhd ip community-list expanded wer deny sde
(config)#
```

show running-config interface igmp

Use this command to show the running system status and configuration for IGMP.

Command Syntax `show running-config interface IFNAME ip igmp`

Parameters

`IFNAME`	Interface name.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show running-config interface eth1 ip igmp
!
interface eth1 !
```

show running-config interface multicast

Use this command to show the running system status and configuration for a multicast interface.

Command Syntax `show running-config interface IFNAME ip multicast`

Parameters

`IFNAME`	Interface name.

Command Mode

Privileged exec mode and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show running-config interface eth1 ip multicast
!
interface eth1 !
```

show running-config prefix-list

Use this command to display the running system status and configuration details for prefix lists.

Command Syntax `show running-config prefix-list`

Parameters

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show running-config prefix-list
! ip prefix-list abc seq 5 permit any ip prefix-
list as description annai ip prefix-list wer seq 45
permit any !
```

show running-config vrf

Use this command to show the running system status and configuration details for a specified VRF instance name.

Command Syntax `show running-config`

`vrf WORD`

Parameters

`WORD`	Virtual Routing and Forwarding name

Command Mode

Privileged exec mode, configure mode, router mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show running-config vrf xyz
! ip vrf xyz
description vrf  router-
id 11.11.11.11
```

show tcp

Use this command to display the Transmission Control Protocol (TCP) connections details.

Command Syntax `show`

`tcp`

Parameters

None

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show tcp
Proto Recv-Q Send-Q Local Address               Foreign Address         State  tcp
0       0 0.0.0.0:22              0.0.0.0:*               LISTEN tcp        0      0
127.0.0.1:25              0.0.0.0:*                  LISTEN tcp         0       1
10.12.44.1:57740        127.0.0.1:705             CLOSE_WAIT tcp        52      0
10.12.44.21:22          10.12.7.89:705            ESTABLISHED tcp       85      0
10.12.44.21:57742      10.12.44.21:57738      ESTABLISHED
```

Table 1-28: Show tcp output

Entry	Description
Proto	Protocol – TCP
Recv-Q	Number of TCP packets in the Receive Queue.
Send-Q	Number of TCP packets in the Send-Q.
Local Address and port number	Local IP address and the port number.

Table 1-28: Show tcp output (Continued)

	Description
number	Foreign (received) IP address and the port number.
	Current state of TCP connections: ESTABLISHED SYN_SENT SYN_RECV FIN_WAIT1 FIN_WAIT2 TIME_WAIT CLOSE CLOSE_WAIT LAST_ACK LISTEN CLOSING UNKNOWN

show users

Use this command to display information about current users.

Command Syntax `show`

```
users
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.

      Line      User      Idle     Location/Session       PID     TYPE         Role
(*) 130 vty 0 [C]root    00:00:36     pts/0             20872    Local     network-admin
(#)    NA      [N]root      NA           1                 NA      NA       network-admin
NA       [N]root     NA           2                 NA       NA       network-admin
131 vty 1 [C]joyce   00:00:26    pts/1             17593     Remote     network-admin
```

Table 1-29 explains the output fields.

Table 1-29: show users fields

Entry	Description
Current users	
CLI user	
Location	
Session	
Lock acquired by user	

Netconf users	
Line	
User	User name.

Table 1-29: show users fields

	Description
	How long the user has been idle.
	Process identifier name.

terminal length

Use this command to set the number of lines displayed on the screen.

Use the `no` option to unset the number of lines on a screen.

Command Syntax `terminal length <0-511> terminal no length`

`<0-511>`

Parameters

`<0-511>`	Number of lines on screen. Specify 0 for no pausing.

Default

By default, terminal length is 25 lines.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
>enable
#terminal length 0
```

The following example sets the terminal length to 30 lines.

```
#terminal length 30
```

terminal monitor

Use this command to display debugging output on a terminal.

Use one of the optional parameters to display debugging output for the Privileged Virtual Router (PVR) or VR user. When the command is used without a parameter, it can be used by a PVR user or non-PVR user to display the debug output on the terminal for the user local VR. When used with a parameter, it may be used only by a PVR user.

The `no` form of the command terminates the debug output on the terminal. Both the PVR and VR user can use this command. In addition, the PVR user can cancel a debug output from a specific VR or all VRs.

Command Syntax `terminal monitor`

`terminal monitor (all|WORD|)`

`terminal no monitor terminal`

`no monitor (WORD|)`

Parameters

`WORD`	Used in the PVR context, and contains the VR name to be included in the debugging session.
`all`	Used the PVR context to include all VR in a PVR debugging session.

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>Enable
#terminal monitor
#terminal no monitor
```

write

Use this command to a write the configuration to the file used at startup or to a specified file. This is the same as the copy running-config startup-config command.

Command Syntax

```
write  file  FILE
write    memory
write WORD
```

Parameters

`FILE` Write to a given path and file. If you do not give a file path, the file is added to `/root`. `memory`

Write to non-volatile memory. `WORD` Write to running configuration file path.

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

This example shows writing the configuration to the startup configuration file:

```
#write
Building configuration...
[OK]
```

This example shows writing the configuration to a specified file:

```
#write file /home/test.txt
Building configuration...
[OK]
```

CHAPTER 2 IMI Shell Commands

This chapter describes IMI shell commands.

- do
- login local
- logout
- ping
- interactive ping
- privilege level
- show privilege
- telnet
- traceroute
- write terminal

do

Use this command to run several exec mode or privileged exec mode commands from configure mode. The commands that can be run from configure mode using `do` are: `show`, `clear`, `debug`, `ping`, `traceroute`, `write`, and `no debug`.

Note: The `do` command supports only the following CLI commands only

Command Syntax `do`

```
LINE
```

Parameters

`LINE`	Command and its parameters.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
#(config)#do show interface
Interface lo
  Hardware is Loopback index 1 metric 1 mtu 16436 duplex-half arp ageing timeout
25
  <UP,LOOPBACK,RUNNING>
  VRF Binding: Not bound
  Label switching is disabled
  No Virtual Circuit configured
  Administrative Group(s): None   DSTE
Bandwidth Constraint Mode is MAM   inet
4.4.4.40/32 secondary   inet 127.0.0.1/8
inet6 ::1/128   Interface Gifindex: 3
  Number of Data Links: 0
  GMPLS Switching Capability Type:
    Packet-Switch Capable-1 (PSC-1)
  GMPLS Encoding Type: Packet
Minimum LSP Bandwidth 0
    input packets 10026, bytes 730660, dropped 0, multicast packets 0
input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
output packets 10026, bytes 730660, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window
0 collisions 0
#
```

login local

Use this command to set a password prompt before entering the configuration mode and to enable password checking.

Use the `no login` command to allow users to connect directly to privileged exec mode skipping the password verification prompt. After using the `no login` command, if the user gives to the `login` command again, the system uses the password used earlier, unless the user specifies a password in configure mode.

Command Syntax `login`

```
local  no  login
local
```

Parameters

None

Default

By default, login local is enabled

Command Mode

Line mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following examples shows setting a password `pass` (in configure mode) before giving the `login` command.

```
#configure terminal
(config)#enable password pass
(config)#line vty 1
(config-line)#login local
```

```
#configure terminal
(config)#line vty 1
(config-line)#no login
```

logout

Use this command to exit the SWMRE shell.

Command Syntax `logout`

Parameters

None

Default

No default value is specified

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>logout
[root@TSUP40 sbin]#
```

ping

Use this command to send echo messages to another host.

Command Syntax `ping WORD (vrf (NAME|management)|) ping ip WORD (vrf (NAME|management)|) ping ipv6 WORD (|IFNAME) ping ipv6 WORD (|IFNAME) (vrf (NAME|management)|)`

Parameters

`WORD`	Destination address (in A.B.C.D format for IPv4 or X:X::X:X for IPv6) or host name.
`vrf`	Virtual Routing and Forwarding instance.
`NAME`	Virtual Routing and Forwarding name.
`management`	Virtual Routing and Forwarding name.
`ip`	IPv4 echo.
`WORD`	Destination address in A.B.C.D format or host name.
`ipv6`	IPv6 echo.
`WORD`	Destination address in X:X::X:X format or host name.
`IFNAME`	Name of the interface.

Default

No default value is specified

Command Mode

Privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
>enable
#ping 20.20.20.1 vrf management
Press CTRL+C to exit
PING 20.20.20.1 (20.20.20.1) 56(84) bytes of data.

--- 3001:db8:0:1::129 ping statistics ---
8 packets transmitted, 8 received, 0% packet loss, time 6999ms
```

interactive ping

Use this command to send echo messages to another host interactively. You are prompted with options supported by the command.

Command Syntax `ping`

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
>enable
#ping
Protocol [ip]:
Target IP address: 20.20.20.1

```

The input prompts are described in Table 2-30:

Table 2-30: ping output fields

Protocol [ip]	IPv4 or IPv6. The default is IPv4 if not specified.
Target IP address	IPv4 or IPv6 address or host name.
Name of the VRF	Name of the Virtual Routing and Forwarding instance.
Repeat count [5]	Number of ping packets to send. The default is 5 if not specified.
Time Interval in Sec [1]	Time interval between two ping packets. The default is 1 second if not specified.
Datagram size [100]	Ping packet size. The default is 100 bytes if not specified.
Timeout in seconds [2]	Time to wait for ping reply. The default is 2 seconds if not specified.
Extended commands [n]	Options for extended ping. The default is “no”.
Source address or interface	Source address or interface.
Type of service [0]	Types of service. The default is 0 if not specified.
Set DF bit in IP header? [no]	Do not fragment bit. The default value is “no” if not specified.
Data pattern [0xABCD]	Specify a pattern.
Ping Broadcast? Then -b [n]	Broadcast ping. The default is “no”. For a broadcast address, the value should be “y”.

privilege level

Use this command to set the command privilege level.

Note: Privilege levels 2-14 are undefined.

Use the `no` parameter with this command to disable the command privilege level.

Command Syntax `privilege level <1-15> privilege level (16) no privilege level (<1-15>|) no privilege level (16)`

Parameters

`16`	Maximum privilege level for a line.
`<1-15>`	Default privilege level for a line.

Default

No default value is specified

Command Mode

Line mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#line vty 0 5
(config-line)#privilege level 15
```

show privilege

Use this command to display the current privilege level. The privilege level range is 1-15.

Command Syntax `show privilege`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show privilege
```

```
Current privilege level is 15
#
```

telnet

Use this command to open a telnet session.

Command Syntax `telnet WORD vrf management|) telnet WORD PORT`

Parameters

`WORD`	IP address or hostname of a remote system.
`PORT`	TCP port number.
`vrf`	Virtual Routing and Forwarding
`management`	Management VRF

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#telnet 2.2.2.2 2602 trying telnet 2.2.2.2 2602...
```

traceroute

Use this command to trace an IPv4/v6 route to its destination.

Command Syntax `traceroute WORD traceroute WORD (vrf (NAME|management)|) traceroute ipv6 WORD traceroute ipv6 WORD (vrf (NAME|management)|)`

Parameters

`WORD` Destination address (in A.B.C.D format for IPv4 or X:X::X:X for IPv6) or host name.

`vrf` Virtual Routing and Forwarding instance.

`NAME` Virtual Routing and Forwarding name. `management` Virtual Routing and Forwarding name. `ip` IPv4 echo.

`WORD` Destination address in A.B.C.D format or host name. `ipv6` IPv6 echo.

`WORD` Destination address in X:X::X:X format or host name.

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#traceroute ip 10.10.100.126 vrf management
traceroute to 10.10.100.126 (10.10.100.126), 30 hops max, 38 byte packets
1 10.1.2.1 (10.1.2.1) 0.386 ms 0.315 ms 0.293 ms
2  10.10.100.126 (10.10.100.126)  1.944 ms  1.497 ms  1.296 ms#
```

write terminal

Use this command to display the current configuration.

Command Syntax `write terminal`

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example `#write terminal`

```
Current configuration:
!
hostname ripd password zebra log stdout
! debug rip events debug rip packet
!
interface lo
!
interface eth0  ip rip send version  1 2  ip rip receive version 1 2
!
interface eth1  ip rip send version  1 2  ip rip receive version 1 2
! !
router rip network 10.10.10.0/24 network 10.10.11.0/24
redistribute connected
```

```
! line vty  exec-timeout 0 0
```

CHAPTER 3 VLOG Commands

This chapter describes virtual router log (VLOG) commands.

- show vlog all
- show vlog clients
- show vlog terminals
- show vlog virtual-routers

show vlog all

Use this command to display the output of all virtual router log `show` commands. For column descriptions, refer to descriptions of the individual commands.

Command Syntax `show`

```
vlog all
```

Parameters

None

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show vlog all

Type       Name      FD  UserVR   AllVrs  VRCnt
tty    /dev/pts/8   12  vr222     ---        1
tty    /dev/pts/4   13 <PVR>     ---       1

VR-Name  VR-Id  PVR-Terms  VR-Terms                    LogFile
CurSize
<PVR>         0          1         0        /var/local/SWMRE/log/pvr/my-log
1624320
vr111         1          0         0        n/a
n/a
vr222         2          0         1
/var/local/SWMRE/log/vr222/logvr222           0
vr333         3          0         0
/var/local/SWMRE/log/vr333/logvr333           0

Name   Id   MsgCnt        ConTime              ReadTime
NSM     1        1  Fri May-15 21:05:04 Fri May-15 21:05:04
```

```
IMI    19        1   Fri May-15 21:05:02  Fri May-15 21:05:02
```

show vlog clients

Use this command to display all attached virtual router log clients (protocol modules).

Command Syntax `show vlog clients`

Parameters

None

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show vlog clients

Name    Id  MsgCnt          ConTime                ReadTime
NSM      1        1     Fri May-15  21:05:04  Fri May-15 21:05:04
IMI     19        1     Fri May-15  21:05:02  Fri May-15 21:05:02
```

Table 3-31 explains the output:

Table 3-31: Virtual router log clients

Name	Name of protocol module
Id	Protocol module identifier
MsgCnt	Number of log messages received from protocol module
ConTime	Time the connection was established
ReadTime	Time the last log message was received

show vlog terminals

Use this command to display all active connections where VLOGD is forwarding log output.

Command Syntax `show vlog terminals`

Parameters

None

Default

None

Command Mode

Privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show vlog terminals

Type     Name     FD  UserVR  AllVrs  VRCnt tty    /dev/pts/8  12
vr222    ---        1 tty   /dev/pts/4   13  <PVR>     ---       1
```

Table 3-32 explains the output:

Table 3-32: Virtual router log terminals

Type	Type of terminal
Name	Device name
FD	File descriptor
UserVR	Name of the Virtual Router where in which the user is logged in
AllVRs	Whether the PVR user requested debug output from all VRs
VRCnt	Number of VRs to which a terminal is attached

show vlog virtual-routers

Use this command to display virtual router statistics such as the number of terminals attached.

Command Syntax `show vlog virtual-routers`

Parameters

None

Default

None

Command Mode

Privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show vlog virtual-routers

VR-Name  VR-Id  PVR-Terms  VR-Terms LogFile
CurSize
<PVR>          0 1           0        /var/local/SWMRE/log/pvr/my-log
1624320
vr111          1 0           0        n/a                                    n/a
vr222          2 0           1        /var/local/SWMRE/log/vr222/log-vr222    0
vr333          3 0           0        /var/local/SWMRE/log/vr333/log-vr333    0
```

Table 3-33 explains the output:

Table 3-33: Virtual router statistics

VR-Name	Virtual router name
VR-Id	Virtual router identifier
PVR-Terms	Number of attached PVR terminals
VR-Terms	Number of attached VR terminals

LogFile	Name of VR log file (this column is empty if writing to a log file is disabled)
CurSize	Log file current size

CHAPTER 4 System Commands

This chapter is a reference for system commands.

- mv
- pwd

mv

Use this command to rename (move) a file.

Command Syntax `mv LINE`

Parameters

`LINE`	Source and destination file names

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#mv old-name new-name
```

pwd

Use this command to print the working directory.

Command Syntax `pwd`

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#pwd
```

CHAPTER 5 Licensing and Upgrade Commands

This chapter is a reference for license and upgrade commands.

- license get
- show license
- show sys-update details
- sys-update commit
- sys-update install
- sys-update list-version
- sys-update rollback

license get

Use this command to fetch the license for this device from a network path or a USB mount path. This command validates the license against the device identifier.

Note: You can provide license file in `.bin` or `.tar` format. If you specify a license file with the extension `.tar`, then this command extracts the file and loads it.

For HTTP, FTP, or TFTP, ensure that the IP address is reachable from the SWMRE device and that the file location is correct.

If you install a license from a USB stick, insert it, and the contents of the USB are available as `//mnt/usb/`. For example:

```
>license get file://mnt/usb/license-FM5RX42-P-20160213.tar
```

After running the `license get` command, you can immediately use the switch without rebooting.

To verify, run the show license command after giving this command.

Command Syntax `license get (|(source-interface IFNAME)) WORD`

Parameters

`IFNAME`	The interface used to download the license. If not specified, `eth0` is used. If the management interface of the switch is in the “management” VRF, then this command uses the “management” VRF to get the license from the specified path. You do need not to know if the management port is in the default VRF or the “management” VRF.
`WORD`	Where to get the license: http://your-server-ip/path/to/file/DeviceId-license.tar ftp://your-server-ip/path/to/file/DeviceId-license.tar tftp://your-server-ip/path/to/file/DeviceId-license.tar file://mnt-point/usb/path/to/file/DeviceId-license.tar

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
>license get http://myServer/license-FM5RX42-P-20160213.tar
```

Specify the `source-interface` parameter to set the interface to use:

```
>license get source-interface xe2 license get http://myServer/license-FM5RX42P-20160213.tar
```

show license

Use this command to display the current license details and errors. The licenses are device locked, which means that a separate license is required for each device. If the License Type is "Limited Edition", then you cannot enter privileged exec mode and execute configuration commands.

Command Syntax

```
show license
```

Parameters

None

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
>show license
License Type: Device Locked, Full edition
License Validity: Permanent
Service Tag: 0030AB30D60C
Service End Date: May 13 2017
```

show sys-update details

Use this command to display upgrade details. The output indicates whether the current version is committed or rolled back.

Command Syntax `show sys-`

```
update details
```

Parameters

None

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show sys-update details
Previous_version EC_AS5812_54X-SWMRE-1.3.4.265-DC_MPLS_ZEBM-S0-P0
Current_version EC_AS5812_54X-SWMRE-1.3.4.266-DC_MPLS_ZEBM-S0-P0-installer
(committed)
Last_upgraded Wed Sep 26 14:40:06 UTC 2018
Auto Rollback end time NA
```

sys-update commit

Use this command to accept a new version. After a commit, you cannot roll back to a previous version. Until you commit a new version, you cannot save the configuration. Upgrading with an installer file is auto committed.

Command Syntax `sys-update`

```
commit
```

Parameters

None

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#sys-update commit
```

sys-update install

Use this command to upgrade the current software to a newer version. You can do two types of installation:

- If a `.deb` file is provided, the board is loaded with new binaries.
- If an installer file is provided, the board is completely installed with a new kernel and binaries.

Command Syntax `sys-update install (|(source-interface IFNAME)) URL (verbose|)`

Parameters

`IFNAME`	The interface used to download the new version. If not specified, `eth0` is used.
`URL`	Where to get the new version: `http://your-server-ip/path/to/file/<abc-updater.deb or abcinstaller> ftp://your-server-ip/path/to/file/<abc-updater.deb or abcinstaller> tftp://your-server-ip/path/to/file/<abc-updater.deb or abcinstaller> file://mnt/usb/path/to/file/<abc-updater.deb or abc-installer>`
`verbose`	Include upgrade logs in the output.

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#sys-update install source-interface eth2 http://10.12.52.150/myServer/
EC_AS5812_54X-SWMRE-1.3.4.266-DC_MPLS_ZEBM-S0-P0-installer verbose

#sys-update install http://10.12.52.150/myServer/EC_AS5812_54X-
SWMRE1.3.4.266-DC_MPLS_ZEBM-S0-P0-installer verbose

#sys-update install http://10.12.52.150/myServer/EC_AS5812_54X-
SWMRE1.3.4.266-DC_MPLS_ZEBM-S0-P0-installer

#sys-update install http://10.12.52.150/myServer/EC_AS5812_54X-
SWMRE1.3.4.266-DC_MPLS_ZEBM-S0-P0-updater.deb
```

sys-update list-version

Use this command to display files and folders. This command supports only FTP and the local file system.

Command Syntax `sys-update list-version ((source-interface IFNAME)|) URL`

Parameters

`IFNAME`	The interface used to download the list. If not specified, `eth0` is used.

`URL`	Where to get the list:
	`ftp://(username@|)serverIP/path/to/file/`
	`file://mnt/usb/path/to/file/`

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#sys-update list-version ftp://10.12.52.150/
```

sys-update rollback

Use this command to roll back to the previous version. After a commit, you cannot roll back. Upgrading with an installer file does not support roll back.

Command Syntax `sys-update rollback (verbose|)`

Parameters `verbose` Include details in the output.

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#sys-update rollback
#sys-update rollback verbose
```

CHAPTER 1 Common Exec Mode Commands

This chapter is a reference for Exec and Privileged mode commands. All commands are common to multipleprotocols. This chapter includes the following commands:

- clear interface fec
- copy empty-config startup-config
- debug nsm all
- debug nsm bfd
- debug nsm events • debug nsm hal
- debug nsm packet
- show cli
- show debugging nsm
- show dot1X
- show interface fec
- show ipv6 rpf
- show list
- show nsm client
- show process
- show running-config router
- show running-config switch
- show running-config urpf
- show startup-config
- show version

clear interface fec

Use this command to clear FEC (forward error correction) statistics on a specified interface or on all interfaces.

Note: This command is not supported on loop-back interfaces or the out-of-band (OOB) management interface.

Command Syntax `clear interface (IFNAME|) fec`

Parameters

`IFNAME`	Physical Interface name.

Default

None

Command Mode

Exec mode and Privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.4.

Example

```
#clear interface ce1/1 fec
```

copy empty-config startup-config

Use this command to clear the contents of the startup configuration.

Command Syntax `copy empty-config startup-config`

Parameters

None

Default

None

Command Mode

Privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#copy empty-config startup-config
#
```

debug nsm all

Use this command to enable NSM debugging.

Use the `no` parameter with this command or the `undebug` command to disable NSM debugging.

Command Syntax `debug nsm (all|) no`

`debug nsm (all|) undebug nsm (all|)`

Parameters

`all`	Enable all debugging.

Default

By default, debug command is disabled.

Command Mode

Exec mode, privileged exec mode, and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#debug nsm all
#
```

debug nsm bfd

Use this command to enable debugging BFD (Bidirectional Forwarding Detection) events.

Use the `no` parameter with this command or the `undebug` command to disable BFD debugging.

Command Syntax `debug nsm bfd no`

`debug nsm bfd undebug nsm bfd`

Parameters

None

Default

By default, debug command is disabled.

Command Mode

Exec mode, privileged exec mode, and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#debug nsm bfd
#
```

debug nsm events

Use this command to enable debugging of NSM events.

Use the `no` parameter with this command or the `undebug` command to disable event debugging.

Command Syntax `debug nsm events no`

`debug nsm events undebug nsm events`

Parameters

None

Default

By default, debug command is disabled.

Command Mode

Exec mode, privileged exec mode, and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#debug nsm events
#
```

debug nsm hal

Use this command to enable debugging of NSM HAL (hardware abstraction layer) events.

Use the `no` parameter with this command or the `undebug` command to disable HAL debugging.

Command Syntax `debug nsm hal (all|) debug`

`debug nsm hal events no debug nsm hal (all|) no debug nsm hal events undebug nsm hal events`

Parameters

`all`	Enable all HAL debugging.
`events`	Enable debugging of only NSM HAL events.

Default

By default, debug command is disabled.

Command Mode

Exec mode, privileged exec mode, and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#debug nsm hal all
#
```

debug nsm packet

Use this command to enable debugging of NSM packet events.

Use the `no` parameter with this command or the undebug command to disable packet debugging.

Command Syntax `debug nsm packet (recv|send|) (detail|) no`

`debug nsm packet (recv|send|) (detail|) undebug nsm packet (recv|send|) (detail|)`

Parameters

`recv`	Specify the debug option-set for receive packet.
`send`	Specify the debug option-set for send packet.
`detail`	Sets the debug option to provide detailed information.

Default

By default, debug command is disabled.

Command Mode

Privileged exec mode, and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#debug nsm packet
#debug nsm packet recv detail
#
```

show cli

Use this command to display the command tree of the current mode.

Command Syntax

`show cli`

Parameters

None

Default

None

Command Mode

All command modes

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show cli
Exec mode:
+-clear
  +-arp-cache [clear arp-cache]
  +-ethernet
    +-cfm
      +-errors
        +-domain
          +-DOMAIN_NAME [clear ethernet cfm errors
(domain DOMAIN_NAME|level LEVEL_ID) (bridge <1-32>|)]
            +-bridge
              +-<1-32> [clear ethernet cfm errors (domain
DOMAIN_NAME|level LEVEL_ID) (bridge <1-32>|)]
        +-level
          +-LEVEL_ID [clear ethernet cfm errors (domain
DOMAIN_NAME|level LEVEL_ID) (bridge <1-32>|)]
            +-bridge
              +-<1-32> [clear ethernet cfm errors (domain DOMAIN_NAME|level
LEVEL_ID) (bridge <1-32>|)]
      +-maintenance-points
        +-remote
          +-domain
            +-DOMAIN_NAME [clear ethernet cfm maintenance-points
remote(domain
D
--More--
```

show debugging nsm

Use this command to display debugging information.

Command Syntax `show debugging nsm`

Parameters

None

Default

None

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show debugging nsm
NSM debugging status:
  NSM event debugging is on
  NSM packet debugging is on
  NSM kernel debugging is on
#
```

show dot1X

Use this command to display IEEE 802.1x port-based access control information.

Command Syntax `show dot1x show dot1x all show dot1x diagnostics interface IFNAME show dot1x interface IFNAME show dot1x sessionstatistics interface IFNAME show dot1x statistics interface IFNAME`

Parameters `all` Display all IEEE 802.1x port-based access control information. `diagnostics` Display diagnostics information.

`IFNAME` Interface name.

`sessionstatistics` Display the statistics for a session.

`statistics` Display the statistics.

Default

None

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show dot1x all
802.1X Port-Based Authentication Disabled
  RADIUS client address: not configured
#
```

Table 1-34 explains the output fields.

Table 1-34: port variables

Field	Description
port Enabled	Interface operational status (Up-true/down-false).
port Control	Current control status of the port for 802.1x control.
port Status	802.1x status of the port (authorized/unauthorized).

Table 1-34: port variables

Field	Description
reAuthenticate	Reauthentication enabled/disabled status on port
reAuthPeriod	Value holds meaning only if reAuthentication is enabled

Table 1-35 explains the output fields.

Table 1-35: supplicant pae related global variables

Field	Description
abort	Authentication should be aborted when set to true.
fail	Failed authentication attempt when set to false.
start	Authentication should be started when set to true.
timeout	Authentication attempt timed out when set to true.
success	Authentication successful when set to true.

Table 1-36 explains the output fields.

Table 1-36: 802.1x operational state of interface

Field	Description
mode	Configured 802.1x mode
reAuthCount	Number of reauthentication count in the interface.
quietperiod	Time between reauthentication attempts in transmit.
reAuthMax	Maximum reauthentication attempts in the interface.

Table 1-37 explains the output fields.

Table 1-37: backend authentication state machine variables and constants

© Symanitron Proprietary

Field	Description
state	State of the port.
reqCount	Count of requests sent to server
suppTimeout	The number of seconds the port waits for a response when relaying a request from the authentication server to the supplicant before resending the request.

Table 1-37: backend authentication state machine variables and constants

Field	Description
serverTimeout	The number of seconds the port waits for a reply when relaying a response from the supplicant to the authentication server before timing out.
maxReq	The maximum number of times a request packet is retransmitted to the supplicant before the authentication session times out.

Table 1-38 explains the output fields.

Table 1-38: controlled directions state machine

Field	Description
adminControlledDirections	Administrative value (Both/In)
operControlledDirections	Operational Value (Both/In)

Table 1-39 explains the output fields.

Table 1-39: kr -- key receive state machine

Field	Description
rxKey	True when EAPOL-Key message is received by supplicant or authenticator. false when key is transmitted

Table 1-40 explains the output fields.

Table 1-40: key transmit state machine

Field	Description
keyAvailable	False when key has been transmitted by authenticator, true when new key is available for key exchange
keyTxEnabled	Key transmission enabled/disabled status

show interface fec

Use this command to display the FEC (forward error correction) statistics for an interface.

Note: You can only display FEC statistics for physical interfaces and not for management or logical interfaces.

Command Syntax `show interface (IFNAME|) fec`

Parameters

`IFNAME`	Physical Interface name.

Default

None

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.4.

Example

```
#show interface ce1/1 fec

    +----------------+--------+-------------------------------------------------+
|  Interface   | FEC   | CORRECTED BLOCK COUNT | UNCORRECTED BLOCK COUNT | +----
------------+--------+-----------------------------------------------+    ce1/1
off         0                           0
```

show ip rpf

Use this command to display reverse path forwarding (RPF) information for the specified source address.

Command Syntax `show ip rpf A.B.C.D show ip rpf (vrf NAME|) A.B.C.D`

Parameters

`A.B.C.D`	IP address of multicast source.
`NAME`	Virtual Routing and Forwarding name.

Default

None

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ip rpf 10.10.10.50

RPF information for 10.10.10.50
  RPF interface: eth0
  RPF neighbor: 10.1.2.1
  RPF route: 0.0.0.0/0
  RPF type: unicast (kernel)
  RPF recursion count: 0
  Doing distance-preferred lookups across tables
  Distance: 0
  Metric: 0
#
```

show ipv6 rpf

Use this command to display reverse path forwarding (RPF) information for the specified source address.

Command Syntax `show ipv6 rpf X:X::X:X show ipv6 rpf (vrf NAME|) X:X::X:X`

Parameters

`X:X::X:X`	IP address of multicast source.
`NAME`	Virtual Routing and Forwarding name.

Default

None

Command Mode

Exec and privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ipv6 rpf 10:10::10:50

RPF information for 10.10.10.50
  RPF interface: eth0
```

```
  RPF neighbor: 10.1.2.1
  RPF route: 0.0.0.0/0
  RPF type: unicast (kernel)
  RPF recursion count: 0
  Doing distance-preferred lookups across tables
  Distance: 0
  Metric: 0
#
```

Table 1-41 Explains the show commands output fields.

Table 1-41: Show ipv6 rpf output fields

Field	Description
RPF Interface	Name of the RPF interface.
RPF neighbor	Upstream RPF neighbor.
RPF route	Route table in which the logical interface address is located.
RPF type	Different type of RPF like multicast, unicast, MBGP, DVMRP, or static mroutes.

Field	Description
RPF recursion count	Number of times that the router lookups its routing table more than once to find out the immediate nexthop and exiting interface.
Distance	IPv6 address of the remote side of the connection. Doing distance-preferred lookups across tables.
Metric	Metrics are informational units that can be measured and compared.

show list

Use this command to display the commands relevant to the current mode.

Command Syntax `show list`

Parameters

None

Default

None

Command Mode

All command modes except IPv4 access-list and IPv6 access-list mode.

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>show list  clear arp-cache   clear bgp *    clear bgp * in   clear bgp * in
prefix-filter   clear bgp * out   clear bgp * soft    clear bgp * soft in
clear bgp * soft out   clear bgp <1-4294967295>   clear bgp <1-4294967295> in
clear bgp <1-4294967295> in prefix-filter    clear bgp <1-4294967295> out
clear bgp <1-4294967295> soft   clear bgp <1-4294967295> soft in    clear bgp
<1-4294967295> soft out    clear bgp (A.B.C.D|X:X::X:X)   clear bgp
(A.B.C.D|X:X::X:X) in   clear bgp (A.B.C.D|X:X::X:X) in prefix-filter   clear
bgp (A.B.C.D|X:X::X:X) out   clear bgp (A.B.C.D|X:X::X:X) soft    clear bgp
(A.B.C.D|X:X::X:X) soft in   clear bgp X:X::X:X soft out

--more--
```

show nsm client

Use this command to display NSM client information including the services requested by the protocols, statistics and the connection time

Command Syntax `show`

```
nsm client
```

Parameters

None

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show nsm client
NSM client ID: 1

NSM client ID: 19
 IMI, socket 23
  Service: Interface Service, Router ID Service, VRF Service
  Messsage received 1, sent 58
  Connection time: Thu Jul 22 11:03:12 2010
  Last message read: Service Request
  Last message write: Link Up
NSM client ID: 25
 ONMD, socket 24
  Service: Interface Service, Bridge service, VLAN service
  Messsage received 2, sent 74
  Connection time: Thu Jul 22 11:03:15 2010
  Last message read: OAM  LLDP msg
  Last message write: Link Up
#
```

show process

Use this command to display a process ID, the name of the process, how long the process has been running and any faults detected on the process.

Command Syntax

```
show process
```

Parameters

None

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show process
 PID NAME             TIME FD
   1 nsm          01:49:24 6

#
```

show running-config router

Use this command to display the running system router configuration.

Command Syntax `show running-config router bgp show running-config router isis show running-config router ldp show running-config router ospf show running-config router rip show running-config router rsvp show running-config router vrrp`

Parameters

`bgp`	Display Border Gateway Protocol (BGP) information.
`isis`	Display Intermediate System to Intermediate System (IS-IS) information.
`ldp`	Display Label Distribution Protocol (LDP) information.
`ospf`	Display Open Shortest Path First (OSPF) information.
`rip`	Display Routing Information Protocol (RIP) information.
`rsvp`	Display Resource Reservation Protocol (RSVP) information.
`vrrp`	Display Virtual Router Redundancy Protocol (VRRP) information.

Default

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show running-config router vrrp
!
router-id 3.3.3.3 !
```

show running-config switch

Use this command to display the running system switch configuration.

Command Syntax `show running-config switch bridge show running-config switch dot1x show running-config switch gmrp show running-config switch gvrp show running-config switch lacp show running-config switch lmi show running-config switch mstp show running-config switch radius-server show running-config switch rpsvt+ show running-config switch rstp show running-config switch ptp show running-config`

```
switch stp show running-config switch synce show
running-config switch vlan
```

Parameters `bridge` Display Bridge group information. `dot1x` Display 802.1x port-based authentication information. `gmrp` Display GARP Multicast Registration Protocol (GMRP) information. `gvrp` Display GARP VLAN Registration Protocol (GVRP) information. `lacp` Display Link Aggregation Control Protocol (LACP) information.

`lmi` Display Ethernet Local Management Interface Protocol (LMI) information. `mstp` Display Multiple Spanning Tree Protocol (MSTP) information.

`radius-server` Display RADIUS server information. `rpvst+` Display Rapid Per-VLAN Spanning Tree (rpvst+) information. `rstp` Display Rapid Spanning Tree Protocol (RSTP) information.

`ptp` Display Precision time Protocol (PTP) `stp` Display Spanning Tree Protocol (STP) information.

`synce` Display synce information. `vlan` Display values associated with a single VLAN.

Default None **Command**

Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
                                        (config)#show running-config switch stp
! bridge 6 ageing-time 45 bridge 6 priority 4096 bridge 6
max-age 7
```

show running-config urpf

Use this command to check uRPF status for this system.

Command Syntax `show running-config urpf`

Parameters

None

Default

None

Command Mode

Exec mode and Privileged exec mode

Applicability

This command was introduced in SWMRE version 1.3.2.

Example

```
    #show running-config urpf ip urpf enable

    (config)#show running-config urpf ip urpf enable
```

show startup-config

Use this command to display the startup configuration.

Command Syntax `show startup-config`

Parameters

None

Default

None

Command Mode

Privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
    #show startup-config
    !   2001/04/21 11:38:52
!
    hostname ripd password zebra log stdout
    ! debug rip events debug rip packet
    !
```

```
interface lo
!
interface eth0  ip rip send version 1 2  ip rip receive version 1 2
!
interface eth1  ip rip send version 1 2  ip rip receive version 1 2
!
router rip redistribute connected network 10.10.10.0/24
network 10.10.11.0/24
! line vty  exec-timeout 0 0
```

show version

Use this command to display SWMRE version information.

Command Syntax

```
show version
```

Parameters

None

Default

None

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show version
Software version: EC_AS5812-54X-SWMRE-1.3.4.268-DC_MPLS_ZEBM-S0-P0
09/27/2018 13:44:22
 Copyright (C) 2018 Coriant. All rights reserved

 Software Product: SWMRE, Version: 1.3.4.268
 Hardware Model: Edgecore 5812-54X-O-AC-F
 Software Feature Code: DC-MPLS-ZEBM
 System Configuration Code: S0
 Package Configuration Code: P0
Software Baseline Version: 1.3.4.208

Installation Information:
 Image Filename: EC_AS5812_54X-SWMRE-1.3.4.268-DC_MPLS_ZEBM-S0-P0-installer
 Install method: http
 ONIE SysInfo: x86_64-accton_as5812_54x-r0
#
```

Table 1-42: Show version output

Entry	Description
Software version	The software version including hardware device name and date.
Software Product	Product name and version.
Hardware Model	Hardware platform.
Software Feature Code	SKU that specifies the capabilities of this version of the software.
System Configuration Code	System configuration number.

Table 1-42: Show version output (Continued)

	Description
	ONIE package installer versions.
	Version from which this release branch is created.
	Information about the installation.
	The file name of the installed image.
	The type of server (or USB stick) from which the software was installed.
	ONIE version.

CHAPTER 2 Common Configure Mode Commands

This chapter provides a reference for the configure mode commands.

- automatic-router-id-selection enable
- clear router-id
- clock timezone
- errdisable cause
- errdisable link-flap-setting
- errdisable timeout
- forwarding custom-profile
- forwarding profile
- hardware-profile filter
- hardware-profile filter (Qumran)
- hardware-profile statistics (Qumran)
- ip urpf enable
- ip urpf allow-default
- ip mroute
- ipv6 mroute
- load-balance rtag7
- load-balance rtag7 hash
- load-balance rtag7 macro-flow
- router-id
- show errdisable details
- show forwarding profile limit
- show hardware-profile filters
- show interface errdisable status
- show router-id
- show running-config router-id

- snmp restart
- watch static-mac-movement

automatic-router-id-selection enable

Use this command to assure that SWMRE selects the loopback IP address as the router-id each time the device is rebooted.

Use the `no` form of this command to remove this constraint.

Command Syntax `automatic-router-id-selection enable no automatic-router-id-selection enable`

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.4.

Examples

```
#configure terminal
(config)#automatic-router-id-selection enable (config)#
```

clear router-id

Use this command to clear the current Router-Id and trigger the Router-Id calculation again. The new Router-id is sent to all protocol modules.

- To clear only the router-id for the default VRF, enter `clear router-id`.
- To clear the router-id for a particular VRF, enter `clear router-id vrf VRFNAME`.
- To clear the router-id for all VRFs, enter `clear router-id vrf`.

Command Syntax `clear router-id (vrf (VRFNAME|))`

Parameters

`VRFNAME`	VPN routing/forwarding instance name.

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.4.

Examples

```
#configure terminal
(config)#clear router-id
(config)#

#configure terminal
(config)#clear router-id vrf
(config)#
```

clock timezone

Use this command to set the system time zone.

Use `no` form of this command to set the default system time zone (UTC).

Command Syntax `clock timezone (WORD) no clock timezone`

Parameters

`WORD`	Timezone name such as Los_Angeles or Hong_Kong

Default

By default, system time zone is UTC

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clock timezone Los_Angeles
```

errdisable cause

Use this command to globally shut down a port when certain errors happen:

- BPDU guard puts an interface configured for Spanning Tree Protocol (STP) Port Fast into the ErrDisable state upon receipt of a STP BPDU to avoid a potential bridging loop.
- If one side of a link-access group (LAG) is configured as a static LAG and the other side as a dynamic LAG, the ports on the side receiving LACP BPDUs go into the ErrDisable state

Note: When link-flap ErrDisable is enabled globally, then all interfaces are enabled. Link-flap ErrDisable can be enabled globally, but disabled for a specific interface with the `no link-flap errdisable` command.

Use `no` form of this command to not shut down a port when certain errors happen.

Command Syntax `errdisable cause {stp-bpdu-guard|lag-mismatch|link-flap}` `no errdisable cause {stp-bpdu-guard|lag-mismatch|link-flap}`

Parameters `stp-bpdu-guard` ErrDisable on stp-bpdu-guard `lag-mismatch` ErrDisable on lag-mismatch `link-flap` ErrDisable on link-flap

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#errdisable cause lag-mismatch
```

errdisable link-flap-setting

Use this command to configure the link-flap errdisable feature.

Note: Any previous flapping accumulated is flushed when you execute this command.

Command Syntax `errdisable link-flap-setting max-flaps <1-100> time <1-1800>`

Parameters

`<1-100>`	Maximum link-flap range
`<1-1800>`	Timer interval in seconds

Default

Five flaps in ten seconds:

max-flaps: 5 time: 10 seconds

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.2.

Examples

```
#configure terminal
                        (config)#errdisable link-flap-setting max-flaps 5 time 20
```

errdisable timeout

Use this command to:

- Enable or disable ErrDisable timeout
- Set the ErrDisable timeout interval

Command Syntax `errdisable timeout (enable|disable) errdisable timeout interval <10-1000000>`

Parameters

`enable`	Enable timeout `disable` Disable timeout
`<10-1000000>`	Timeout interval in seconds

Default

By default, zero: timer is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#errdisable timeout enable
                                    (config)#errdisable timeout interval 1000
```

forwarding custom-profile

Use this command to configure forwarding table sizes.

Note: You must reboot after any profile change, except a change to the default profile. The configuration is applied only after a reboot.

Use `show-running configuration` or show forwarding profile limit to verify the selected profile.

Use the `forwarding custom-profile default` command (with no parameters) to set the forwarding table size to its default.

Command Syntax

Tomahawk platform:

```
forwarding custom-profile {l2-banks <1-4>|l3-banks <1-4>|lpm-banks 2}
```

Helix4 platform:

```
forwarding custom-profile {l2-banks <1-24>|l3-banks <1-23>|vlan-xlate-banks
  <123>|ep-vlan-xlate-banks <1-23>}
```

Tomahawk and Helix4 platforms:

```
forwarding custom-profile default
```

Parameters

`l2-banks` L2 banks. Unspecified banks are used as L2 banks.

`<1-4>` Number of L2 banks. Each bank size is 32k entries and each entry is 105 bits.

`<1-24>` Number of L2 banks. Each bank size is 1k entries and each entry is 420 bits.

`l3-banks` L3 banks. Unspecified banks are used as L2 banks.

`<1-4>` Number of L3 banks. Each bank size is 32k entries and each entry is 105 bits.

`<1-23>` Number of L3 banks. Each bank size is 1k entries and each entry is 420 bits.

`lpm-banks` Longest-prefix match banks. Unspecified banks are used as L2 banks.

`2` Two LPM banks per entry. The remaining banks can be used by any.

`vlan-xlate-banks`

VLAN translate banks. Unspecified banks are used as L2 banks.

`<1-23>` Number of VLAN translate banks. Each bank size is 1k entries and each entry is 420 bits. `ep-vlan-xlate-banks`

Egress VLAN translate banks. Unspecified banks are used as L2 banks.

<1-23>	Number of EP VLAN translate banks. Each bank size is 1k entries and each entry is 420 bits.
default	Use L2 profile Three; the size of the l2 table (MAC address table) and L3 table (host table) is almost equal.

Default

By default, forwarding table size is L2 profile Three.

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.

This command only applies to Tomahawk and Helix4 platforms.

Examples

```
#configure terminal
                                        (config)#forwarding custom-profile l3-banks 4
```

forwarding profile

Use this command to configure forwarding table sizes.

Note: You must reboot after any profile change, except a change to the default profile. The configuration is applied only after a reboot.

Use `show-running configuration` or show forwarding profile limit to verify the selected profile.

Use this `no` command to set the forwarding table size to the default.

Command Syntax

```
forwarding profile (l2-profile-one | l2-profile-two | l2-profile-three |
                                                              l3-profile
| l3-128bit-profile | lpm-profile | lpm-128bit-profile)
no forwarding profile
```

Parameters

For details about these profiles, see show forwarding profile limit.

`l2-profile-one` L2 profile One `l2-profile-two` L2 profile Two `l2-profile-three`

L2 profile Three (default); the size of the l2 table (Mac address table) and l3 table (Host table) is almost equal

`l3-profile` L3 profile `l3-128bit-profile`

L3 profile with IPv6 prefix >64 support

`lpm-profile` Longest-prefix match profile `lpm-128bit-profile`

LPM profile with IPv6 prefix >64 support

Default

The default forwarding table size is L2 profile Three.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#forwarding profile l2-profile-one
```

hardware-profile filter

Use this command to enable or disable ingress IPv4 or IPv6 and egress IPv6 filter groups. Disabling filter groups increases the configurable filter entries.

Command Syntax `hardware-profile filter (ingress-ipv4|ingress-ipv6|egress-ipv6) (enable|disable)`

Parameter `ingress-ipv4` IPv4 filter ingress group. `ingress-ipv6` IPv6 filter ingress group. `egress-ipv6` IPv6 filter egress group. `enable` Enable filter group. `disable` Disable filter group.

Default

By default, all filter groups are enabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

This form of the `hardware-profile filter` command is *not* available on Qumran platforms. See hardware-profile filter (Qumran).

Examples

```
#configure terminal
(config)#hardware-profile filter ingress-ipv4 disable
(config)#hardware-profile filter ingress-ipv4 enable
```

hardware-profile filter (Qumran)

Use this command to enable or disable ingress and egress filter groups. Disabling filter groups increases the configurable filter entries.

Command Syntax

```
hardware-profile filter (ingress-l2-group|ingress-ipv4|qos-group|egress-ipv4|egress-ipv6|egress-l2-group) (enable|disable)
```

Parameter `ingress-l2-group` Layer 2 (MAC) filter ingress group. `ingress-ipv4` IPv4 filter ingress group. `qos-group` QoS filter group. `egress-ipv4` IPv4 filter egress group. `egress-ipv6` IPv6 filter egress group. `egress-l2-group` Layer 2 (MAC) filter egress group.

`enable`	Enable filter group. `disable` Disable filter group.

Default

By default, all filter groups are enabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

This command was only available on Qumran platforms. For other platforms, see hardware-profile filter.

Examples

```
#configure terminal
(config)#hardware-profile filter ingress-ipv4 disable
(config)#hardware-profile filter ingress-ipv4 enable
```

hardware-profile statistics (Qumran)

Use this command to enable or disable filter statistics in hardware.

Note: You must reboot the switch after giving this command for the changes to take effect.

Command Syntax

```
hardware-profile statistics (ingress-acl|mpls-ac|mpls-lsp|mpls-pwe)
  (enable|disable)
```

Parameter

`ingress-acl`	Ingress ACL statistics.
`mpls-ac`	Attachment circuit statistics.
`mpls-lsp`	LSP statistics.
`mpls-pwe`	Pseudowire logical interfaces statistics.
`enable`	Enable statistics.
`disable`	Disable statistics.

Default

By default, filter statistics are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

This command is only available on Qumran platforms.

Examples

```
#configure terminal
(config)#hardware-profile statistics mpls-lsp enable
```

ip urpf enable

Use this command to enable uRPF mode on the system.

Use the `no` form of the command to disable uRPF mode on this system.

Note:The configuration is applied only after a reboot.

Command Syntax `ip urpf enable`

```
no ip urpf enable
```

Parameter

None

Default

By default, uRPF mode on the system is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.2.

Examples

```
#configure terminal
(config)#ip urpf enable
% System Reboot is required for new URPF configurations to take effect

(config)#no ip urpf enable
% System Reboot is required for new URPF configurations to take effect
```

ip urpf allow-default

Use this command to enable default route check for uRPF mode.

Use `no` form of this command to disable default route check for uRPF mode.

Command Syntax

This command applies only to Qumran platforms. `ip urpf allow-default no ip`

```
urpf allow-default
```

Parameter

None

Default

By default, uRPF mode on the system is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.2.

Examples

```
#configure terminal
(config)#ip urpf allow-default

(config)#no ip urpf allow-default
```

ip mroute

Use this command to create a multicast static route.

Multicast static routes are unicast routes which allow multicast and unicast topologies to be incongruous. These routes are used by multicast routing protocols to perform Reverse Path Forwarding (RPF) checks.

Use the `no` form of this command to clear a multicast static route.

Command Syntax `ip mroute (vrf NAME|) A.B.C.D/M (static|rip|ospf|bgp|isis|) (A.B.C.D|INTERFACE)`

`ip mroute (vrf NAME|) A.B.C.D/M (static|rip|ospf|bgp|isis|) (A.B.C.D|INTERFACE) <1-255>`

`no ip mroute (vrf NAME|) A.B.C.D/M (static|rip|ospf|bgp|isis|)`

Parameters

`NAME`	Virtual Routing and Forwarding name
`A.B.C.D/M`	Multicast source IP address and mask of the source
`static`	Static routes.
`rip`	Routing Information Protocol.
`ospf`	Open Shortest Patch First protocol.
`bgp`	Border Gateway Protocol.
`isis`	Intermediate System to Intermediate System protocol.
`A.B.C.D`	IP address to use as the RPF address. A host IP address can be a directly connected system or a remote system. For remote systems, a recursive lookup is done from the unicast routing table to find a directly connected system. Recursive lookup is done up to one level.
`INTERFACE`	Incoming interface name or pseudo interface null. Only specify for non-broadcast interfaces.
`<1-255>`	Administrative distance for the multicast static route. This value determines whether a unicast route or multicast static route is used for the RPF lookup. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence.

Default

The default administrative distance for the multicast static route is 0.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip mroute 10.10.10.50/24 10.10.10.20 1
```

```
#configure terminal
(config)#ip mroute vrf VRF_A 10.10.10.50/1 10.10.10.20 1
```

ipv6 mroute

Use this command to create a multicast static route.

Multicast static routes are unicast routes that allow multicast and unicast topologies to be incongruous. These routes are used by multicast routing protocols to perform Reverse Path Forwarding (RPF) checks.

Use the `no` form of this command to clear a multicast static route.

Command Syntax `ipv6 mroute (vrf NAME|) X:X::X:X/M (static|rip|ospf|bgp|isis|) X:X::X:X INTERFACE`

`ipv6 mroute (vrf NAME|) X:X::X:X/M (static|rip|ospf|bgp|isis|) (X:X::X:X|INTERFACE)`

`ipv6 mroute (vrf NAME|) X:X::X:X/M (static|rip|ospf|bgp|isis|) X:X::X:X INTERFACE <1-255>`

`ipv6 mroute (vrf NAME|) X:X::X:X/M (static|rip|ospf|bgp|isis|) (X:X::X:X|INTERFACE)`

`<1-255> no ipv6 mroute (vrf NAME|) X:X::X:X/M (static|rip|ospf|bgp|isis|)`

Parameters

`NAME`	Virtual Routing and Forwarding name
`X:X::X:X/M`	Specify multicast source IP address and mask
`static`	Static routes.
`rip`	Routing Information Protocol.
`bgp`	Border Gateway Protocol.
`ospf`	Open Shortest Path First.
`isis`	Intermediate System to Intermediate System.
`X:X::X:X`	RPF address for the multicast route. A host IP address can be a directly connected system or a remote system. For remote systems, a recursive lookup is done from the unicast routing table to find a directly connected system. Recursive lookup is done up one level.
`INTERFACE`	Incoming interface name. Can only be specified for non-broadcast interfaces.
`<1-255>`	Administrative distance for the multicast static route. This value determines whether a unicast route or multicast static route is used for the RPF lookup. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence.

Default

The default administrative distance for the multicast static route is 0.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
(config)#ipv6 mroute 10:10::10:10/64 10:10::10:12 1
```

load-balance rtag7

Use this command to configure rtag7 load balancing.

Use the `no` option to disable the rtag7 load balancing.

Command Syntax

This form enables or disables rtag7 load balancing globally:

```
load-balance rtag7 no load-balance rtag7
```

By default, load balancing is enabled for ECMP, LAG, and TRILL.

This form sets rtag7 hashing for ECMP and L3 LAG based on IPv4 fields:

```
load-balance rtag7 (ipv4 {src-ipv4|dest-ipv4|srcl4-port|destl4-port|protocol-id})
no load-balance rtag7 (ipv4 {src-ipv4|dest-ipv4|srcl4-port|destl4-port|protocol-
id})
```

By default, IPv4 ECMP is configured with the fields `src-ipv4`, `dest-ipv4`, `srcl4-port`, and `dest-l4port`.

By default, L3 LAG is configured with the fields `src-ipv4` and `dest-ipv4`.

This form sets rtag7 hashing for ECMP based on IPv6 fields:

```
load-balance rtag7 (ipv6 {src-ipv6|dest-ipv6|srcl4-port|destl4-port|next-hdr}) no
load-balance rtag7 (ipv6 {src-ipv6|dest-ipv6|srcl4-port|destl4-port|next-hdr})
```

By default, IPv6 ECMP is configured with the fields `src-ipv6`, `dest-ipv6`, `srcl4-port`, and `dest-l4port`.

This form sets rtag7 hashing for L2 LAG based on L2 fields:

```
load-balance rtag7 (l2 {dest-mac|src-mac|ether-type|vlan}) no
load-balance rtag7 (l2 {dest-mac|src-mac|ether-type|vlan})
```

By default, L2 LAG is configured with the fields `src-mac` and `dest-mac`.

This form sets rtag7 hashing on an MPLS egress LER node based on L2/L3 fields:

```
load-balance rtag7 (mpls-ler ((inner-l2 ({dest-mac|src-mac|ether-type|vlan})) |
  (inner-l3 ({src-ip|dest-ip|srcl4-port|destl4-port|protocol-id})))) no load-
balance rtag7 (mpls-ler ((inner-l2 ({dest-mac|src-mac|ether-type|vlan})) | (inner-
l3 ({src-ip|dest-ip|srcl4-port|destl4-port|protocol-id}))))
```

Please note the following:

- For ingress LER nodes, hashing is done on L2 fields, L3 fields (outer IPx), or inner IP fields (only for IPx-over-IPx or IPx-over-GRE-IPx).
- For egress LER nodes, hashing is done based on only L2 and L3 fields immediately after the MPLS header which is popped. Any other fields are not supported.

This form sets rtag7 hashing based on TRILL fields:

```
load-balance rtag7 (trill (outer-l2|inner-l2|inner-l3)) no
load-balance rtag7 (trill (outer-l2|inner-l2|inner-l3))
```

By default, TRILL is configured with the inner-l2 header's inner SMAC and DMAC.

This form sets rtag7 hashing based on the outer IP address:

```
load-balance rtag7 (tunnel outer-l3-header) no
load-balance rtag7 (tunnel outer-l3-header)
```

Parameters `ipv4` Load balance IPv4 packets

`src-ipv4` Source IPv4 based load balancing `dest-ipv4` Destination IPv4 based load balancing `srcl4-port` Source L4 port based load balancing `destl4-port` Destination L4 port based load balancing `protocol-id` Protocol ID based load balancing

`ipv6` Load balance IPv6 packets

`src-ipv6` Source IPV6 based load balancing `dest-ipv6` Destination IPv6 based load balancing `srcl4-port` Source L4 port based load balancing `destl4-port` Destination L4 port based load balancing `next-hdr` Next header field for IPv6

`l2` Load balance L2 packets

`dest-mac` Destination MAC address based load balancing `src-mac` Source MAC address based load balancing `ether-type` Ether-type based load balancing `vlan` VLAN-based load balancing

`trill` Load balance TRILL packets

`outer-l2` TRILL outer l2 header (outer SMAC, outer DMAC, outer VLAN) `inner-l2` TRILL inner l2 header (inner SMAC, inner DMAC, inner VLAN, TRILL tunnel) `inner-l3` TRILL inner l3 header (inner SIP, inner DIP, L4 src/dest port)

`tunnel` Load balance tunneled packets based on outer header (default uses the inner-header)

`outer-l3-header`

Use outer header for hashing (ip-over-ip, ipv6-over-ip, ip-over-gre-ip, ipv6-over-gre-ip, ipv6-over-ipv6, ip-over-ipv6, ip-over-gre-ipv6, ipv6-over-gre-ipv6)

`mpls-ler` Load balance LER packets `inner-l2` Load balance Inner l2 header `dest-mac` Destination MAC address load balancing `src-mac` Source MAC address

`ether-type`

Ether-type based load balancing

`vlan` VLAN tag id

`inner-l3` Inner l3 header `dest-ip` Destination IP address `src-ip` Source IP address

`srcl4-port`

Source L4 port based load balancing

`protocol ID`

Protocol (IPv4), nxt-hdr (IPv6)

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
(config)#load-balance rtag7
                                    (config)#load-balance rtag7 ipv4 src-ipv4
```

load-balance rtag7 hash

Use this command to set the rtag7 hash computation method.

Use the `no` parameter to set the rtag7 hash computation method to its default.

Command Syntax `load-balance rtag7 hash (crc16-bisync|crc16-ccitt|crc32-lo|crc32-hi) no load-balance rtag7 hash`

Parameters

`crc16-bisync`	16-bit CRC16 using the binary synchronous polynomial.
`crc16-ccitt`	16-bit CRC16 using the CCITT polynomial.
`crc16-hi`	16 most significant bits of computed CRC32.
`crc16-lo`	16 least significant bits of computed CRC32

Default

The default rtag7 hash computation method is 16-bit CRC16 using the binary synchronous polynomial `(crc16bisync)`.

Command Mode

Configure mode

Default settings `load-balance rtag7 hash`

`crc16-bisync`

Applicability

This command was introduced in version SWMRE version 1.3.1.

Example

```
#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
(config)#load-balance rtag7
(config)#load-balance rtag7 hash crc16-ccit (config)#show
running-config | inc rtag7
!
load-balance rtag7
load-balance rtag7 hash crc16-ccitt
!
(config)#no load-balance rtag7 hash
(config)#
```

load-balance rtag7 macro-flow

Use this command to enable rtag7 macro-flow based hashing.

When macro-flow is enabled, a hash function is chosen dynamically based on corresponding macro flow. It is useful when hash polarization is observed in the topology.

Use the `no` parameter to disable rtag7 macro-flow based hashing.

Command Syntax `load-balance rtag7 macro-flow no load-balance rtag7 macro-flow`

Parameters

None

Default

By default, rtag7 macro-flow based hashing is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in version SWMRE version 1.3.1.

Example

```
#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
(config)#load-balance rtag7
(config)#load-balance rtag7 macro-flow
(config)#show running-config | inc rtag7
!
load-balance rtag7 load-
balance rtag7 macro-flow
!
(config)#no load-balance rtag7 macro-flow
```

router-id

Use this command to add a router identifier for this system.

Use the `no` form of this command to disable this function.

Command Syntax `router-id A.B.C.D no router-id (A.B.C.D)`

Parameters

`A.B.C.D`	Router identifier in IP address format for this system.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router-id 123.12.3.123
(config)#
```

show errdisable details

Use this command to display ErrDisable settings.

Command Syntax `show errdisable details`

Parameters

None

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show errdisable details
```

show forwarding profile limit

Use this command to show all the forwarding table sizes.

Command Syntax `show forwarding profile limit`

Parameters

None

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show forwarding profile limit
Current profile : l2-profile-three

=========================================================================
                              Forwarding Profile Table                  |

Profile Name        | MAC-Table Size |Host-Table Size| Prefix-Table Size |
                    | ------------------------------------------------|
                    |   MAC ADDR     |IPV4 UC IPV6 UC|    IPV4    IPV6   | ---
-------------------------------------------------------------------------| l2-
profile-one           288K          16K     8K          8k     4k      | l2-
profile-two           224K          80K     40K         8k     4k      | l2-
profile-three                                                          |
(default)        160K          144K    72K         8k     4k     | l3-profile
96K           208K    104K        8k     4k     | lpm-profile             32K
16K     8K          128k   16k    |
========================================================================= #
```

Table 2-43 explains the show command output fields.

Table 2-43: show forwarding profile limit output

Entry	Description
Profile Name	Names of the forwarding profiles.

MAC-Table Sizes	The MAC address tables
Host-Table Sizes	Size of host tables.

Table 2-43: show forwarding profile limit output (Continued)

	Description
	Size of the prefix tables.
	Number of kilobytes available for MAC for each forwarding table.
	Number of kilobytes available for IPv4 unicast host for each forwarding table.
	Number of kilobytes available for IPv6 unicast hosts for each forwarding table.
	Number of kilobytes available for IPv4 addresses for each forwarding table.
	Number of kilobytes available for IPv6 prefixes that are less than or equal to 64 for each forwarding table.
	Number of kilobytes available for IPv6 prefixes that are greater than or equal 65 for each forwarding table.

show hardware-profile filters

Command Syntax `show hardware-profile filters`

Parameters

None

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

This command is *not* available on Qumran platforms.

Examples

```
#show hardware-profile filters
INGRESS:
+--------------------+---------+---------+-------------------------+
|                    | Free    | Used    |       Total Entries     |
| TCAMS              | Entries | Entries |-------------------------|
|                    |         |         | Total | Dedicated | shared |
+--------------------+---------+---------+-------+-----------+--------+
 QOS                  1012      12        1024    512         512
 L2-ACL               1021      3         1024    512         512
 IPV4-ACL             768       0         768     256         512
 IPV6-ACL             766       2         768     256         512
EGRESS:
+--------------------+---------+---------+-------------------------+
|                    | Free    | Used    |       Total Entries     |
| TCAMS              | Entries | Entries |-------------------------|
|                    |         |         | Total | Dedicated | shared |
+--------------------+---------+---------+-------+-----------+--------+
 L2-ACL/IPV4-ACL/QOS  256       0         256     256         0
 IPV6-ACL             256       0         256     256         0
```

show interface errdisable status

Use this command to display ErrDisable conditions for an interface.

Command Syntax `show interface errdisable status`

Parameters

None

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show interface errdisable status ge1 lag-mismatch-errdisable ge2 stp-
bpdu-guard-errdisable
```

show router-id

Use this command to display the Router ID of the current system.

Command Syntax `show router-id`

Parameters

None

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show router-id
Router ID: 10.55.0.2 (automatic)
```

show running-config router-id

Use this command to show the running system global router ID configuration.

Command Syntax `show running-config router-id`

Parameters

None

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show running-config router-id
!
router-id 3.3.3.3 !
```

snmp restart

Use this command to restart SNMP for a given process.

Command Syntax

```
snmp restart (auth | bfd | bgp | cfm | efm | isis | ldp | lldp | mrib | mstp | nsm |
  ospf | ospf6 | pim | rib| rip | rmon | rsvp | trill | vrrp)
```

Parameters

None

Default

By default, SNMP resart is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#snmp restart nsm
```

watch static-mac-movement

Use this command to watch any MAC movement is detected over static MAC entry for a time period. Notification will be displaying if static MAC movement happens till timer expires.

Command Syntax `watch static-mac-movement`

`(<1-300>|)`

Parameters

`<1-300>`	Timer value in second.

Default

By default, timer is 10 seconds

Command Mode

Exec mode

Applicability

This command was introduced in SWMRE version 1.3.2.

Examples

```
#watch static-mac-movement
```

CHAPTER 3 Common Route-Map Mode Commands

This chapter is a reference for route-map commands. These commands are common to multiple protocols

This chapter includes the following commands:

- continue
- match as-path
- match community
- match extcommunity
- match interface
- match ip address
- match ip address prefix-list
- match ip next-hop
- match ip next-hop prefix-list
- match ip peer
- match ipv6 address
- match ipv6 address prefix-list
- match ipv6 next-hop
- match ipv6 next-hop prefix-list
- match ipv6 peer
- match metric
- match origin
- match route-type
- match tag
- route-map
- set aggregator
- set as-path
- set atomic-aggregate
- set comm-list
- set community
- set dampening
- set extcommunity
- set interface null0
- set ip next-hop
- set ipv6 next-hop
- set level
- set local-preference
- set metric

- set metric-type
- set origin
- set originator-id
- set tag
- set vpnv4 next-hop
- set weight
- show route-map
- show running-config route-map

continue

The continue clause provides the capability to execute additional entries in a route map after an entry is executed with a successful match and set clauses (i.e), the continue command allows multiple entries to be evaluated within a single route-map. Continue commands can be assigned optional sequence numbers that indicate the order in which clauses are to be evaluated.

Use the no form of the command (specifying a particular sequence number if desired), to remove individual or all continue clauses from a route-map.

Continue clause with match Clauses

When a match clause exists in a route map with continue clause, then the continue clause is executed only when a successful match occurs. If a match clause does not exist in the route-map and if a continue clause does exist, the continue clause will be evaluated and then go to the specified route-map entry. When a successful match occurs and we have a continue clause, the route-map executes the set clauses and then goes to the specified route-map entry. If continue clause does not exist in the next route map, then the route-map will behave normally. If a continue clause exists in the next route-map but a match is not successful, the route-map will not continue and will *fall through* to the next sequence number if one exists.

Continue clause with set Clauses

Set clauses are executed after the route-map evaluation is done. The set clauses are evaluated and executed in the order in which they were configured. Set clauses are only executed after a successful match occurs. The continue statement proceeds to the specified route-map entry only after configured set actions are performed. If a set action is configured in the first route-map and then the same set action occurs again, but with a different value in a subsequent route-map entry, then the last set action will override the previous set actions, which were configured with the same set command.

Command Syntax continue

```
<2-65535>|) no continue
<2-65535>|)
```

Parameter

<2-65535>	Continue sequence number.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Example

```
(config)#route-map Rmap1
(config-route-map)#continue ?
```

```
      <2-65535>  Route-map entry sequence number
                                                                  <cr>
    (config-route-map)#continue 10
(config-route-map)#continue 30
```

match as-path

Use this command to match an autonomous system path access list. This command specifies the autonomous system path to be matched. If there is a match for the specified AS path, and `permit` is specified, the route is redistributed or controlled, as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are `not` met then the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes, depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid only for BGP.

Use the `no` parameter with this command to remove a path list entry.

Command Syntax `match as-path WORD no match as-path (WORD|)`

Parameter

`WORD`	Autonomous system path access list name.

Default

Enabled

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#route-map myroute deny 34
(config-route-map)#match as-path myaccesslist
```

match community

Use this command to specify the community to be matched.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes. This command allows the matching based on community lists.

The values set by the `match community` command overrides the global values. The route that does not match at least one match clause is ignored.

Note: This command is valid only for BGP.

Use the `no` parameter with this command to remove the community list entry.

Command Syntax `match community (<1-99>|<100-199>|WORD) (exact-match|) no match community (<1-99>|<100-199>|WORD|) (exact-match|)`

Parameters

`<1-99>`	Community-list number (standard).
`<100-199>`	Community-list number (expanded).
`WORD`	Community-list name.
`exact-match`	Do exact matching of communities.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match community mylist
```

match extcommunity

Use this command to match BGP external community list

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes. This command allows the matching based on community lists.

The values set by this command overrides the global values. The route that does not match at least one match clause is ignored.

Note: This command is valid only for BGP.

Use the no parameter with this command to remove the community list entry.

Command Syntax match extcommunity (<1-99>|<100-199>|WORD) (exact-match|) no match extcommunity (<1-99>|<100-199>|WORD|) (exact-match|)

Parameters

<1-99>	Community-list number (standard).
<100-199>	Community-list number (expanded).
WORD	Name of the community-list.
exact-match	Do exact matching of communities.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match extcommunity mylist
```

match interface

Use this command to define the interface match criterion. This command specifies the next-hop interface name of a route to be matched.

Use the no parameter with this command to remove the specified match criterion.

Command Syntax match interface IFNAME no match interface (IFNAME|)

Parameter

IFNAME	Interface name.

Default

By default, match interface is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#route-map mymap1 permit 10
(config-route-map)#match interface eth0
```

match ip address

Use this command to specify the match address of route. If there is a match for the specified IP address, and `permit` is specified, the route is redistributed or controlled, as specified by the set action. If the match criteria are met, and `deny` is specified then the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes, depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to remove the `match ip address` entry.

Command Syntax `match ip address (<1-199>|<1300-2699>|WORD)` `no match ip address (<1-199>|<1300-2699>|WORD|)`

Parameters

`WORD`	IP access-list name.
`<1-199>`	IP access-list number (standard range).
`<1300-2699>`	IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match ip address List1
```

match ip address prefix-list

Use this command to match entries of a prefix-list. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or

content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables. Use the `no` parameter with this command too disable this function

Command Syntax `match ip address prefix-list WORD no match ip address prefix-list (WORD|)`

Parameter

`WORD`	IP prefix list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ip address prefix-list mylist
```

match ip next-hop

Use this command to specify a next-hop address to be matched in a route-map. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to disable this function.

Command Syntax `match ip next-hop (<1-199>|<1300-2699>|WORD) no match ip next-hop (<1-199>|<1300-2699>|WORD|)`

Parameters

`WORD`	Specify the IP access-list name.
`<1-199>`	Specify the IP access-list number (standard range).
`<1300-2699>`	Specify the IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ip next-hop mylist
```

match ip next-hop prefix-list

Use this command to specify the next-hop IP address match criterion using the prefix-list. This command matches the next-hop IP address of a route.

Use the `no` parameter with this command to remove the specified match criterion.

Command Syntax `match ip next-hop prefix-list WORD no match ip next-hop prefix-list (WORD|)`

Parameter

`WORD`	Prefix-list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ip next-hop prefix-list list1
```

match ip peer

Use this command to specify the match peer IPv4 address of a route.

Use the `no` parameter with this command to remove the specified match criterion.

Command Syntax `match ip peer (<1-199>|<1300-2699>|WORD) no match ip peer (<1-199>|<1300-2699>|WORD|)`

Parameter

WORD	IP access-list name.
<1-199>	IP access-list number (standard range).
<1300-2699>	IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ip peer 123

(config-route-map)#no match ip peer 123
```

match ipv6 address

Use this command to specify the match address of route. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to remove the `match ip address` entry.

Note: This command is valid for BGP, OSPFv3, and RIPng only.

Command Syntax `match ipv6 address WORD no match ipv6 address (WORD|)`

Parameter

WORD	IPv6 access list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map myRM deny 1
(config-route-map)#match ipv6 address myRM
```

match ipv6 address prefix-list

Use this command to match entries of a prefix-list. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes, depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid for BGP, OSPFv3, and RIPng only.

Use the `no` parameter with this command to disable this function

Command Syntax `match ipv6 address prefix-list WORD no match ipv6 address prefix-list (WORD|)`

Parameter

`WORD`	IPv6 access list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ipv6 address prefix-list mylist
```

match ipv6 next-hop

Use this command to specify the next-hop address to be matched. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid for BGP and IS-IS only.

Use the `no` parameter with this command to disable this function

Command Syntax `match ipv6 next-hop (X:X::X:X|WORD) no match ipv6 next-hop (X:X::X:X|WORD|)`

Parameters

X:X::X:X	IPv6 address of the next-hop.
WORD	IPv6 access list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ipv6 next-hop 3ffe::1
```

match ipv6 next-hop prefix-list

Use this command to match entries of a prefix-list. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid for BGP and IS-IS only.

Use the `no` parameter with this command to disable this function

Command Syntax `match ipv6 next-hop prefix-list WORD no match ipv6 next-hop prefix-list WORD`

Parameters

WORD	IPv6 access list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
```

```
(config-route-map)#match ipv6 next-hop prefix-list new
```

match ipv6 peer

Use this command to specify the match peer IPv6 address of a route.

Use the `no` parameter with this command to remove the specified match criterion.

Command Syntax `match ipv6 peer (<1-199>|<1300-2699>|WORD) no match ipv6 peer (<1-199>|<1300-2699>|WORD|)`

Parameter

`WORD`	IP access-list name.
`<1-199>`	IP access-list number (standard range).
`<1300-2699>`	IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ipv6 peer 123

(config-route-map)#no match ipv6 peer 123
```

match metric

Use this command to match a metric of a route. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid for BGP, OSPF, RIP, and IS-IS only.

Use the `no` parameter with this command to disable this function

Command Syntax `match metric <0-4294967295> no match metric (<0-4294967295>|)`

Parameters

`<0-4261412864>`	Metric value.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match metric 888999
```

match origin

Use this command to match origin code. The origin attribute defines the origin of the path information. The `egp` parameter is indicated as an `e` in the routing table, and it indicates that the origin of the information is learned via EGP (Exterior Gateway Protocol). The `igp` parameter is indicated as an `i` in the routing table, and it indicates the origin of the path information is interior to the originating AS. The `incomplete` parameter is indicated as a `?` in the routing table, and indicates that the origin of the path information is unknown or learned through other means. If a static route is redistributed into BGP, the origin of the route is incomplete.

This command specifies the origin to be matched. If there is a match for the specified origin, and `permit` is specified when you created the route-map, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid only for BGP.

Use the `no` parameter with this command to disable this matching.

Command Syntax `match origin`

```
(egp|igp|incomplete) no match origin
(egp|igp|incomplete|)
```

Parameters `egp` Remote exterior gateway protocol.

`igp` Local internal gateway protocol.

`incomplete` Unknown heritage.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#route-map myroute deny 34
(config-route-map)#match origin egp
```

match route-type

Use this command to match an external route type. AS-external LSA is either Type-1 or Type-2. External type-1 matches only Type 1 external routes and external type-2 matches only Type 2 external routes.

Use the `no` parameter with this command to turn off the matching.

Command Syntax `match route-type external (type-1|type-2) no match route-type external (type-1|type-2|)`

Parameters

`type-1`	Match OSPF External Type 1 metric.
`type-2`	Match OSPF External Type 2 metric.

Default

By default, match route type external is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap1 permit 10
(config-route-map)#match route-type external type-1
```

match tag

Use this command to match the specified tag value.

Use the `no` parameter with this command to turn off the declaration.

Command Syntax `match tag <0-4294967295> no match tag (<0-4294967295>|)`

Parameters

`<0-4294967295>`	Tag value.

Default

By default, match tag is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap1 permit 10
(config-route-map)#match tag 100
```

route-map

Use this command to enter route-map mode and to permit or deny match/set operations.

This command controls and modifies routing information to allow redistribution of routes. It has a list of `match` and `set` commands associated with it. The `match` commands specify the conditions under which redistribution is allowed, and the `set` commands specify the particular redistribution actions to be performed if the criteria enforced by match commands are met. Route maps are used for detailed control over route distribution between routing processes.

Route maps also allow policy routing, and might route packets to a different route than the obvious shortest path.

Use the `no` parameter with this command to turn off the declaration.

Command Syntax `route-map WORD (deny|permit) <1-65535> no route-map WORD ((deny|permit) <1-65535>|)`

Parameters

`WORD`	Route-map name (maximum size 63 characters).
`deny`	Route map deny set operations. If this parameter is specified, and the match criteria are met, the route is not redistributed, and any other route maps with the same map tag are not examined.
`permit`	Route map permit set operations. If this parameter is specified, and the match criteria are met, the route is redistributed as specified by the set actions. If the `match` criteria are not met, the next route map with the same tag is tested.
`<1-65535>`	Sequence to insert into or delete from an existing route-map.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#route-map route1 permit 1
(config-route-map)#
```

set aggregator

Use this command to set the AS number for the route map and router ID. An Autonomous System (AS) is a collection of networks under a common administration sharing a common routing strategy. It is subdivided by areas, and is assigned a unique 16-bit number. Use the `set aggregator` command to assign an AS number for the aggregator.

To use the `set aggregator` command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function

Command Syntax `set aggregator as <1-65535>`

`A.B.C.D no set aggregator as (<1-65535>`

`A.B.C.D|)`

Parameters

`<1-65535>` AS number of aggregator. `A.B.C.D`

IP address of aggregator.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#set aggregator as 43 10.10.0.3
```

set as-path

Use this command to modify an autonomous system path for a route. By specifying the length of the AS-Path, the router influences the best path selection by a neighbor. Use this command to prepend an AS path string to routes increasing the AS path length.

To use this command, you must first give the match and set commands configure the conditions for redistributing routes from one routing protocol to another:

- The match command specifies the match criteria under which redistribution is allowed for the current route-map.
- The set command specifies the set redistribution actions to be performed if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the no parameter with this command to disable this function.

Command Syntax set as-path prepend .<1-65535>

set as-path prepend .<1-4294967295> no set as-path prepend (.<1-65535>|) no set as-path prepend (.<1-4294967295>|)

Parameters

<1-65535> SWMRE prepends this number to the AS path.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#set as-path prepend 8 24
```

set atomic-aggregate

Use this command to set an atomic aggregate attribute.

To use this command, you must first have a match clause. Match and set commands set the conditions for redistributing routes from one routing protocol to another. The match command specifies the match criteria under which redistribution is allowed for the current route-map. The set command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the no parameter with this command to disable this function

Command Syntax set atomic-aggregate no set atomic-aggregate

Parameters

No default value is specified

Default

None

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set atomic-aggregate
```

set comm-list

Use this command to delete the matched communities from the community attribute of an inbound or outbound update when applying route-map.

Use the `no` parameter with this command to disable this feature.

Command Syntax `set comm-list (<1-99>|<100-199>|WORD) delete no set comm-list (<1-99>|<100-199>|WORD) delete`

Parameters

`<1-99>`	Standard community-list number.
`<100-199>`	Expanded community-list number.
`WORD`	Name of the community-list.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map myRM permit 3
(config-route-map)#set comm-list 34 delete
```

set community

Use this command to set the communities attribute. and group destinations in a certain community, as well as apply routing decisions according to those communities.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to delete the entry.

Command Syntax

```
set community [<65536-4294901759>|AA:NN|internet|local-AS|no-advertise|no-
  export|none] (additive|)
no set community [AA:NN|internet|local-AS|no-advertise|no-export|none] (additive|)
```

Parameters

`<65536-4294901759>`	Community number
`AA:NN`	The community number in aa:nn format.
`internet`	Internet.
`local-AS`	Do not send outside the local AS (well-known community).
`no-advertise`	Do not advertise this route to eBGP peers
`no-export`	Do not advertise this route to any peer.
`none`	Remove the community attribute from the prefixes that pass the route-map.
`additive`	Add to the existing community.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following examples show the use of the `set community` command with different parameters.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set community no-export no-advertise
```

```
#configure terminal
(config)#route-map rmap1 permit 3
```

```
(config-route-map)#set community no-advertise
```

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set community 10:01 23:34 12:14 no-export
```

set dampening

Use this command to enable route-flap dampening and set parameters. Set the unreachability half-life time to be equal to, or greater than, reachability half-life time. The suppress-limit value must be greater than or equal to the reuse limit value.

Use the `no` parameter with this command to delete the entry.

Command Syntax `set dampening <1-45> <1-20000> <1-20000> <1-255>`

`(<1-45>|) no set dampening <1-45> <1-20000> <1-20000> <1-255>`

`(<1-45>|)`

Parameters

`<1-45>`	Reachability half-life time in minutes. The time for the penalty to decrease to one-half of its current value.
`<1-20000>`	Reuse-limit value. When the penalty for a suppressed route decays below the reuse value, the routes become unsuppressed.
`<1-20000>`	Suppress-limit value. When the penalty for a route exceeds the suppress value, the route is suppressed.
`<1-255>`	Max-suppress-time. Maximum time that a dampened route is suppressed.
`<1-45>`	Unreachability half-life time for penalty, in minutes.

Default

Default reachability half-life time: 15 minutes

Default reuse limit value: 750

Default suppress limit value: 2000

Default max-suppress value is 4 times the half-life time (60 minutes)

Default unreachability half-life time value: 15 minutes

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#route-map R1 permit 24
(config-route-map)#set dampening 20 333 534 30
```

set extcommunity

Use this command to set an extended community attribute.

To use this command you must first have a match clause. The `match` and `set` commands define the conditions for redistributing routes from one routing protocol to another:

- The `match` command defines the match criteria under which redistribution is allowed for the current route-map.

- The `set` command defines the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function.

Command Syntax `set extcommunity rt .AA:NN (additive|) set extcommunity soo .AA:NN set extcommunity cost (igp|pre-bestpath|) <0-255> <0-4294967295> no set extcommunity rt (.AA:NN|) (additive|) no set extcommunity soo (.AA:NN|)`

`no set extcommunity cost (igp|pre-bestpath|) <0-255> <0-4294967295>`

Parameters

`rt`	Route target extended community.
`.AA:NN`	VPN extended community
`additive`	Add to the exsisting community.
`soo`	Site-of-origin extended community.
`cost`	Extended cost community.
`igp`	Compare following IGP cost comparison.
`pre-bestpath`	Compare following IGP cost comparison.
`<0-255>`	Community ID.
`<0-4294967295>`	Cost.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
```

```
(config)#route-map rmap1 permit 3 (config-
route-map)#set extcommunity rt 06:01

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set extcommunity rt 0.0.0.6:01

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set extcommunity soo 06:01

#configure terminal
(config-route-map)#route-map rmap1 permit 3
(config-route-map)#set extcommunity soo 0.0.0.6:01
```

© Symanitron Proprietary

set interface null0

Use this command to discard routes based on policy/rules configured for a route map.

Route maps can be applied to BGP neighbors. When this command is given for a route map and that route map is applied to a BGP neighbor, the discard route entries are added by BGP for the prefix permitted by the route map.

Use the `no` form of this command to not discard routes based on policy/rules configured for a route map.

Command Syntax `set interface null0 no set interface null0`

Parameters

None

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced in SWMRE version 1.3.4.

Example

To discard 1.1.1.1/24 from BGP neighbor 30.1.1.1:

```
#configure terminal
(config)#ip prefix-list myPrefixList seq 5 permit 1.1.1.1/24 eq
24 (config)#route-map myRM permit 1
(config-route-map)#match ip address prefix-list
myPrefixList (config-route-map)#set interface null0
(config-route-map)#exit (config)#router bgp
200
(config-router)#neighbor 30.1.1.1 remote-as 200
(config-router)#neighbor 30.1.1.1 route-map myRM in
```

set ip next-hop

Use this command to set the specified next-hop value.

Use the `no` parameter with this command to turn off the setting.

Note: This command is valid for BGP, OSPF, and RIP only.

Command Syntax `set ip next-hop A.B.C.D no set ip next-hop (A.B.C.D|)`

Parameter

`A.B.C.D`	IP address of the next-hop.

Default

By default, set ip next hop A.B.C.D is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap permit 3
                                        (config-route-map)#set ip next-hop 10.10.0.67
```

set ipv6 next-hop

Use this command to set a next hop-address.

Use the `no` parameter with this command to delete an entry.

Note: This command is valid for BGP and OSPFv3 only.

Command Syntax `set ipv6 next-hop X:X::X:X set ipv6 next-hop local X:X::X:X no set ipv6 next-hop (X:X::X:X|) no set ipv6 next-hop local (X:X::X:X|)`

Parameters

`X:X::X:X` Global IPv6 address of the nexthop. `local` Local IPv6 address of the nexthop.

Default

By default, set ipv6 next hop X:X::X:X is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
               (config-route-map)#set ipv6 next-hop local fe80::203:47ff:fe97:66dc
```

set level

Use this command to set the IS-IS level to export a route.

Use the `no` parameter with this command to disable this function.

Command Syntax `set level (level-1|level-2|level-1-2) no set level (level-1|level-2|level-1-2|)`

Parameters

`level-1`	Export into a level-1 area.
`level-2`	Export into a level-2 sub-domain.
`level-1-2`	Export into level-1 and level-2.

Default

By default, set level is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set level level-1
```

set local-preference

Use this command to set the BGP local preference path attribute.

Use the `no` parameter with this command to disable this function.

Command Syntax `set local-preference <0-4294967295> no set local-preference (<0-4294967295>|)`

Parameters

`<0-4294967295>` Tag value for destination routing protocol.

Default

By default, set local preference is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
                  (config-route-map)#set local-preference 12
```

set metric

Use this command to set a metric value for a route and influence external neighbors about the preferred path into an Autonomous System (AS). The preferred path is the one with a lower metric value. A router compares metrics for paths from neighbors in the same ASs. To compare metrics from neighbors coming from different ASs, use the `bgp always-compare-med` command.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function.

Command Syntax `set metric`

`WORD no set metric`

`(WORD|)`

Parameters

`WORD`	Metric value [+/-] <1-4294967295>

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set metric 600
```

set metric-type

Use this command to set the metric type for the destination routing protocol. Select a type to be either Type-1 or Type2 in the AS-external-LSA when the route-map matches the condition.

Note: This command is for OSPF, OSPFv3, or IS-IS only.

Use the `no` parameter with this command to return to the default.

Command Syntax `set metric-type (internal|external)` `set metric-type (type-1|type-2)` `no set metric-type (internal|external|)` `no set metric-type (type-1|type-2|)`

Parameters

`external`	IS-IS external metric type.
`internal`	IS-IS internal metric type.
`type-1`	OSPF external type 1 metric.
`type-2`	OSPF external type 2 metric

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

In this example the metric type of the destination protocol is set to OSPF external Type 1.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set metric-type 1
```

set origin

Use this command to set the BGP origin code. The origin attribute defines the origin of the path information.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to delete an entry.

Command Syntax `set origin (egp|igp|incomplete)` `no set origin (egp|igp|incomplete|)`

Parameters `egp` Learned through an Exterior Gateway Protocol.

`igp` Interior to the originating AS. This happens when an Internal Gateway Protocol is redistributed into BGP.

`incomplete` Unknown or learned through some other means. This happens when a static route is redistributed in BGP and the origin of the route is incomplete.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set origin egp
```

set originator-id

Use this command to set the originator ID attribute.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process. Use the `no` parameter with this command to disable this function

Command Syntax `set originator-id A.B.C.D`

`no set originator-id (A.B.C.D|)`

Parameter

`A.B.C.D`	IP address of originator.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set originator-id 1.1.1.1
```

set tag

Use this command to set a tag value. The parameter is the route tag that is labeled by another routing protocol (BGP or other IGP when redistributing), because AS-external-LSA has a route-tag field in its LSAs. In addition, when using route-

map, SWMRE can tag the LSAs with the appropriate tag value. Sometimes the tag matches with using route-map, and sometimes, the value may be used by another application.

Use the `no` parameter with this command to unset a tag value.

Command Syntax `set tag <0-4294967295> no set tag (<0-4294967295>|)`

Parameter

`<0-4294967295>` Tag value for destination routing protocol.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

In the following example the tag value of the destination routing protocol is set to 6:

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set tag 6
```

set vpnv4 next-hop

Use this command to set a VPNv4 next-hop address.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Note: This command is valid for BGP only.

Use the no parameter with this command to disable this function

Command Syntax set vpnv4 next-hop A.B.C.D
no set vpnv4 next-hop (A.B.C.D|)

Parameter

A.B.C.D IP address of originator.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set vpnv4 next-hop 6.6.6.6
```

set weight

Use this command to set weights for the routing table.

The weight value is used to assist in best path selection. It is assigned locally to a router. When there are several routes with a common destination, the routes with a higher weight value are preferred.

To use this command, you must first have a match clause. Match and set commands set the conditions for redistributing routes from one routing protocol to another. The match command specifies the match criteria under which redistribution is allowed for the current route-map. The set command specifies the set redistribution actions to be performed, if the match criteria are met.

Note: This command is valid only for BGP.

Use the no parameter with this command to delete an entry.

Command Syntax `set weight <0-4294967295> no set weight (<0-4294967295>|)`

Parameter

`<0-4294967295>` Weight value.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

In the following configuration, all routes that apply to access-list 10 will have the weight set at 400. If the packets do not match any of the defined criteria, they are routed through the normal routing process.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match as-path 10
(config-route-map)#set weight 400
```

show route-map

Use this command to display route-map information.

Command Syntax `show route-map (|WORD)`

Parameters

`WORD`	Route-map name (maximum size 63 characters)

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following is a sample output of the `show route-map` command.

```
#show route-map route-map myRM, permit, sequence 1
  Match clauses:     metric 200   Set clauses:
metric 60
#
```

show running-config route-map

Use this command to display the running system status and configuration details for route-maps.

Command Syntax `show running-config route-map`

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show running-config route-map
! route-map abc deny 2 match
community 2
! route-map abc permit 3 match route-type
external type-2 set metric-type type-1 !
```

CHAPTER 4 Interface Commands

This chapter is a reference for each of the interface commands.

- admin-group
- bandwidth
- clear interface counters
- clear interface cpu counters
- clear ip prefix-list
- clear ipv6 neighbors
- clear ipv6 prefix-list
- description
- duplex
- fec
- hardware-profile portmode
- hardware-profile portmode bundle
- if-arbiter
- interface
- ip address A.B.C.D/M
- ip address dhcp
- ip forwarding
- ip local-proxy-arp
- ip prefix-list
- ip proxy-arp
- ip remote-address
- ip unnumbered
- ip vrf forwarding
- ipv6 address
- ipv6 forwarding
- ipv6 nd current-hoplimit
- ipv6 nd link-mtu
- ipv6 nd managed-config-flag
- ipv6 nd minimum-ra-interval
- ipv6 nd other-config-flag
- ipv6 nd prefix
- ipv6 nd ra-interval
- ipv6 nd ra-lifetime

- ipv6 nd reachable-time
- ipv6 nd retransmission-time
- ipv6 nd suppress-ra
- ipv6 prefix-list
- ipv6 unnumbered
- link-flap errdisable
- load interval
- mtu
- multicast
- port breakout enable
- port bundle enable
- show interface
- show interface counters
- show interface counters drop-stats
- show interface counters error-stats
- show interface counters (indiscard-stats|outdiscard-stats)
- show interface counters protocol
- show interface counters queue-drop-stats
- show interface counters queue-stats
- show interface counters rate
- show interface counters summary
- show ip forwarding
- show ip interface
- show ip prefix-list
- show ip route
- show ip vrf
- show ipv6 forwarding
- show ipv6 interface brief
- show ipv6 route
- show ipv6 prefix-list
- show hosts
- show running-config interface
- show running-config interface ip
- show running-config interface ipv6
- show running-config ip
- show running-config ipv6

- shutdown
- speed
- switchport
- switchport allowed ethertype

admin-group

Use this command to create an administrative group to be used for links. Each link can be a member of one or more, or no administrative groups.

When used in the interface mode, this command adds a link between an interface and a group. The name is the name of the group previously configured. There can be multiple groups per interface. The group is created in configure mode, then interfaces are added to the group in interface mode.

Use the `no` parameter with this command to disable this command.

Command Syntax `admin-group NAME no admin-group NAME`

Parameters

`NAME`	Name of the admin group to add.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

In the following example, the `eth3` interface is added to the group `myGroup`:

```
#configure terminal
(config)#interface eth3
(config-if)#admin-group myGroup
```

bandwidth

Use this command to specify a discrete, maximum bandwidth value for the interface.

Use the `no` parameter resets the interface's bandwidth to the default value.

Command Syntax

```
bandwidth BANDWIDTH
no bandwidth
```

Parameter

BANDWIDTH	<1-999>k for 1 to 999 kilobits/s
	<1-999>m for 1 to 999 megabits/s
	<1-100>g for 1 to 100 gigabits/s

Default

Default bandwidth will be default speed of the interface. For LAG, default bandwidth will be collective bandwidth of its member ports. For VLAN interface, default bandwidth is 1 gigabits/sec.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface xe4
(config-if)#bandwidth 100m
```

clear interface counters

Use this command to clear the statistics on a specified interface or on all interfaces.

Note: This command is not supported on loopback interfaces or the out-of-band management (OOB) management interface.

Command Syntax `clear interface`

```
(IFNAME|) counters
```

Parameter

IFNAME	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear interface xe0 counters
```

clear interface cpu counters

Use this command to clear the CPU queue counters.

Command Syntax `clear interface cpu counters`

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in SWMRE version 1.3.1.

This command is not available on Qumran platforms.

Example

```
#clear interface cpu counters
```

clear ip prefix-list

Use this command to reset the hit count to zero in the prefix-list entries for an IPv4 interface.

Command Syntax `clear ip prefix-list clear ip prefix-list`

`WORD clear ip prefix-list WORD A.B.C.D/M`

Parameters

`WORD`	Name of the prefix-list.
`A.B.C.D/M`	IP prefix and length.

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear ip prefix-list List1
```

clear ipv6 neighbors

Use this command to clear all dynamic IPv6 neighbor entries.

Command Syntax `clear ipv6 neighbors`

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear ipv6 neighbors
```

clear ipv6 prefix-list

Use this command to reset the hit count to zero in the prefix-list entries for an IPv6 interface.

Command Syntax `clear ipv6 prefix-list clear ipv6 prefix-list`

`WORD clear ipv6 prefix-list WORD X:X::X:X/M`

Parameters

`WORD`	Name of the prefix-list.
`X:X::X:X/M`	IP prefix and length.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear ipv6 prefix-list List1
```

description

Use this command to assign an description to an interface.

Use the `no` parameter to remove an interface description.

Command Syntax `description LINE no description`

Parameter

`LINE` Interface description.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following example provides information about the connecting router for interface `eth1`.

```
Router#configure terminal
Router(config)#interface eth1
Router(config-if)#description Connected to Zenith's fas2/0
```

duplex

Use this command to set the duplex mode for each interface.

Use the `no` parameter to remove the duplex mode.

Command Syntax `duplex (half|full) no duplex`

Parameter

`half` Half-duplex mode. `full` Full-duplex mode.

Default

By default, duplex mode is full duplex.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#duplex full

(config-if)#no duplex
```

fec

Use this command to configure forward error correction (FEC) on a physical port.

Use no parameter to un-configure FEC.

Command Syntax `fec (on|auto) no fec`

Parameter

`on`	Enable FEC. `auto` Enable FEC with autonegotiation.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#fec on

(config-if)#no fec
```

hardware-profile portmode

Use this command to set the global port mode.

Command Syntax `hardware-profile portmode (4X10g|40g)`

Parameter

`4X10g`	Split all the 40G flex ports on the system
`40g`	Disable splitting on all flex ports and make all ports 40G

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#hardware-profile portmode 40g
```

hardware-profile portmode bundle

Use this command to set the global port mode to bundle.

Command Syntax `hardware-profile portmode bundle (40g|4X10g)`

Parameter

`40g`	Bundle four 10G ports to a single 40G port
`4x10g`	Unbundle ports

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#hardware-profile portmode bundle 40g
(config)#exit
(config)#hardware-profile portmode bundle 4x10g
(config)#exit
```

if-arbiter

Use this command to discover new interfaces recently added to the kernel and add them to the SWMRE database.

This command starts the arbiter to check interface information periodically. SWMRE dynamically finds any new interfaces added to the kernel. If an interface is loaded dynamically into the kernel when SWMRE is already running, this command polls and updates the kernel information periodically.

Use the `no` parameter with this command to revert to default.

Command syntax `if-arbiter (interval <1-65535>|) no if-arbiter`

Parameter `interval` Interval (in seconds) after which NSM sends a query to the kernel.

Default

By default, `if-arbiter` is disabled. When interface-related operations are performed outside of SWMRE (such as when using the `ifconfig` command), enable `if-arbiter` for a transient time to complete synchronization. When synchronization is complete, disable it by giving the `noif-arbiter` command.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#if-arbiter interval 5
```

interface

Use this command to select an interface to configure, and to enter the `Interface` command mode.

Use the `no` parameter with this command to remove this configuration.

Command Syntax		
`IFNAME`	`no`	`interface IFNAME`

Parameter

`IFNAME`	Name of the interface.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

This example shows the use of this command to enter the `Interface` mode (note the change in the prompt).

```
#configure terminal
(config)#interface eth3
(config-if)#
```

ip address A.B.C.D/M

Use this command to specify that an IP address and prefix length will be used by this interface. If the `secondary` parameter is not specified, this command overwrites the primary IP address. If the `secondary` parameter is specified, this command adds a new IP address to the interface. The secondary address cannot be configured in the absence of a primary IP address. The primary address cannot be removed when a secondary address is present.

Use the `no` parameter with this command to remove the IP address from an interface.

Command Syntax `ip address A.B.C.D/M label LINE`

```
ip address A.B.C.D/M (secondary|) ip address
A.B.C.D/M secondary label LINE no ip address
A.B.C.D/M label LINE no ip address A.B.C.D/M
secondary label LINE no ip address (A.B.C.D/M
(secondary|)|)
```

Parameters

`LINE`	Label of this address.
`secondary`	Make the IP address secondary.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
(config)#interface eth3
(config-if)#ip address 10.10.10.50/24
(config-if)#ip address 10.10.11.50/24 secondary
```

ip address dhcp

Use this command to specify that a DHCP client will be used to obtain an IP address for an interface.

Use the `no` parameter with this command to remove the IP address from an interface.

Command Syntax `ip address dhcp no`

```
ip address dhcp
```

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
(config)#interface eth3
(config-if)#ip address 10.10.10.50/24 (config-
if)#ip address 10.10.11.50/24 secondary
(config-if)#ip address dhcp
```

ip forwarding

Use this command to turn on IP forwarding.

Use the `no` parameter with this command to turn off IP forwarding.

Command Syntax `ip forwarding ip forwarding vrf NAME no ip forwarding`

```
no ip forwarding vrf NAME
```

Parameters

`NAME`	Virtual Routing and Forwarding name

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip forwarding
```

ip local-proxy-arp

Use this command to enable local proxying of ARP requests at the interface level.

After giving this command, the device answers all ARP requests on a configured subnet, even for clients that normally do not need routing. Local proxy ARP implies a proxy ARP that occurs on the same interface, that is, the traffic comes in and goes out the same interface.

With local proxy ARP, ARP responds to all ARP requests for IP addresses within the subnet and forwards all traffic between hosts in the subnet. Use this feature only on subnets where hosts are intentionally prevented from communicating directly.

Use the `no` parameter to disable the local proxy ARP feature on an interface.

Command Syntax `ip local-proxy-arp` `no ip local-proxy-arp`

Parameters

None

Default

By default, local proxy ARP is disabled

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#ip local-proxy-arp
```

ip prefix-list

Use this command to create an entry for a prefix list.

A router starts to match prefixes from the top of the prefix list and stops whenever a match or deny occurs. To promote efficiency, use the `seq` parameter and place common matches or denials towards the top of the list. The sequence values are generated in the sequence of 5.

Use the parameters `ge` and `le` specify the range of the prefix length to be matched. When setting these parameters, set `le` to be less than 32 and `ge` to be less than `le` value.

Use the `no` parameter with this command to delete the prefix-list entry.

Command Syntax `ip prefix-list WORD (deny|permit) (A.B.C.D/M|any) ip prefix-list WORD (deny|permit) A.B.C.D/M eq <0-32> ip prefix-list WORD (deny|permit) A.B.C.D/M ge <0-32> ip prefix-list WORD (deny|permit) A.B.C.D/M ge <0-32> le <0-32> ip prefix-list WORD (deny|permit) A.B.C.D/M le <0-32> ip prefix-list WORD (deny|permit) A.B.C.D/M le <0-32> ge <0-32> ip prefix-list WORD seq <1-4294967295> (deny|permit) (A.B.C.D/M|any) ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M eq <0-32> ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M ge <0-32> ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M ge <0-32> le <0-32> ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M le <0-32> ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M le <0-32> ge <0-32> no ip prefix-list WORD no ip prefix-list WORD (deny|permit) (A.B.C.D/M|any) no ip prefix-list WORD (deny|permit) A.B.C.D/M eq <0-32> no ip prefix-list WORD (deny|permit)`

A.B.C.D/M ge <0-32> no ip prefix-list WORD (deny|permit) A.B.C.D/M ge <0-32> le <0-32> no ip prefix-list WORD (deny|permit) A.B.C.D/M le <0-32> no ip prefix-list WORD (deny|permit) A.B.C.D/M le <0-32> ge <0-32> no ip prefix-list WORD seq <1-4294967295> (deny|permit) (A.B.C.D/M|any) no ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M eq <0-32> no ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M ge <0-32> no ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M ge <0-32> le <0-

32> no ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M le <0-32> no ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M le <0-32> ge <0-

32> ip prefix-list sequence-number no ip prefix-list sequence-number

```
ip prefix-list WORD description LINE
no ip prefix-list WORD description
LINE no ip prefix-list WORD
description
```

Parameters

WORD	Name of the prefix list.
deny	Reject packets.
permit	Accept packets.
A.B.C.D/M	IP address mask and length of the prefix list mask.
eg	Exact prefix length match
le	Maximum prefix length match
ge	Minimum prefix length match
<0-32>	Prefix length to match
<1-4294967295>	Sequence number of the prefix list.
any	Take all packets of any length. This parameter is the same as using 0.0.0.0/0 le 32 for A.B.C.D/M.
sequence-number	To suppress sequence number generation, give the `no ip prefix-list sequencenumber` command. If you disable the generating sequence numbers, you must specify the sequence number for each entry using the sequence number parameter in the `ip prefix-list` command. To enable sequence number generation, give the `ip prefix-list sequencenumber` command.
LINE	Up to 80 characters describing this prefix-list.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

In this configuration, the `ip prefix-list` command matches all, but denies the IP address range, 76.2.2.0.

```
#conf t
(config)#router bgp 100
(config-router)#network 172.1.1.0
(config-router)#network 172.1.2.0
(config-router)#
(config-router)#neighbor 10.6.5.3 remote-as 300
```

© Symanitron Proprietary

```
    (config-router)#neighbor 10.6.5.3 prefix-list mylist out
    (config-router)#exit
    (config)#ip prefix-list mylist seq 5 deny 76.2.2.0/24
(config)#ip prefix-list mylist seq 10 permit 0.0.0.0/0
```

ip proxy-arp

Use this command to enable the proxy ARP feature on an interface.

Use the `no` parameter to disable the proxy ARP feature on an interface.

Command Syntax `ip proxy-arp no ip proxy-arp`

Parameters

None

Default

By default, the ip proxy-arp is disabled

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#ip proxy-arp
```

ip remote-address

Use this command to set the remote address (far end) on a point-to-point non multi-access link. This command can be used only on unnumbered interfaces. When a new remote-address is configured, the old address gets overwritten.

Use the `no` parameter to disable this function.

Command Syntax `ip remote-address A.B.C.D/M`

`no ip remote-address`

Parameter

`A.B.C.D/M`	IP address and prefix length of the link remote address.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
(config)#interface ppp0
(config-if)#ip unnumbered eth1
(config-if)#ip remote-address 1.1.1.1/32
```

ip unnumbered

Use this command to enable IP processing without an explicit address on a point-to-point non multi-access link.

This command lets an interface borrow the IP address of a specified interface to enable IP processing on a point-topoint interface without assigning it an explicit IP address. In this way, the IP unnumbered interface can borrow the IP address of another interface already configured on the router to conserve network and address space.

Use the `no` parameter with this command to remove this feature on an interface.

Command Syntax `ip unnumbered IFNAME`

`no ip unnumbered`

Parameter

`IFNAME`	Interface name.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following example creates a tunnel on `eth1`.

```
(config)#interface lo
(config-if)#ip address 127.0.0.1/8
(config-if)#ip address 33.33.33.33/32 secondary
(config-if)#exit
(config)#interface eth1
(config-if)#ip address 10.10.10.145/24
(config-if)#exit
(config)#interface Tunnel0
(config-if)#tunnel source 10.70.0.145
(config-if)#tunnel destination 10.70.0.77
(config-if)#tunnel ttl 255
(config-if)#tunnel path-mtu-discovery
(config-if)#tunnel mode gre
(config-if)#ip unnumbered eth1
(config-if)#exit
(config)#router ospf
(config-router)#network 10.10.10.0/24 area 0
```

ip vrf forwarding

This command associates an interface with a VRF.

Use the `no` parameter with this command to unbind an interface.

Note: When you give this command in interface configuration or subinterface configuration mode of the parent VR, the IP address and other attributes of the interface are deleted from the interface. After giving this command, the IP attributes must then be configured in the context of the VRF.

Note: The Out Of Band (OOB) management port is part of the “management” VRF. Also, this port cannot be moved out of “management” VRF.

Command Syntax `ip vrf forwarding WORD no ip vrf forwarding WORD`

Parameter

`WORD`	Name of the VRF.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#ip vrf myVRF
(config-vrf)#exit
(config)#interface eth1
(config-if)#ip vrf forwarding myVRF
```

ipv6 address

Use this command to set the IPv6 address of an interface.

Use the `no` form of this command to disable this function.

Command Syntax `ipv6 address X:X::X:X/M ipv6 address X:X::X:X/M anycast no ipv6 address X:X::X:X/M`

Parameters

`X:X::X:X/M`	IP destination prefix and a mask length.
`anycast`	Make an anycast address which is assigned to a set of interfaces that belong to different devices. A packet sent to an anycast address is delivered to the closest interface (as defined by the routing protocols in use) identified by the anycast address

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 address 3ffe:506::1/64
```

ipv6 forwarding

Use this command to turn on IPv6 forwarding.

Use the `no` parameter with this command to turn off IPv6 forwarding.

Command Syntax `ipv6 forwarding ipv6 forwarding vrf NAME no ipv6 forwarding no ipv6 forwarding vrf NAME`

Parameters

NAME	Virtual Routing or Forwarding name

Default

No default value is specified

Command Mode

Command mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#ipv6 forwarding
```

ipv6 nd current-hoplimit

Use this command to set an ND (Neighbor Discovery) advertised hop limit for an interface.

Use the `no` option of this command to set the current hop limit to its default value.

Command Syntax `ipv6 nd current-hoplimit <0-255> no ipv6 nd current-hoplimit`

Parameter

<0-255>	Hop limit.

Default

By default, hop limit is 64

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd current-hoplimit 10
(config-if)#no ipv6 nd current-hoplimit
```

ipv6 nd link-mtu

Use this command to set an advertised maximum transmission unit (MTU).

Use the `no` option with the command to reset the MTU to the default statute.

Command Syntax `ipv6 nd link-mtu (<1280-65535>) no ipv6 nd link-mtu`

Parameters

`<1280-65535>` Link MTU value.

Default

By default, link MTU value is 1500

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd link-mtu 1600
(config-if)#no ipv6 nd link-mtu
```

ipv6 nd managed-config-flag

Use this command to set the managed address configuration flag in the Router Advertisement to be used for the IPv6 address auto-configuration.

Use the `no` parameter with this command to reset the value to default.

Command Syntax `ipv6 nd managed-config-flag no ipv6 nd managed-config-flag`

Parameters

None

Default

The managed address configuration flag is not set.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
```

```
(config)#interface eth3 (config-if)#ipv6
nd managed-config-flag (config-if)#no ipv6
nd managed-config-flag
```

ipv6 nd minimum-ra-interval

Use this command to set a minimum Router Advertisement (RA) interval for the interface.

Use the `no` option with the command to set the RA interval to its default value.

Command Syntax `ipv6 nd minimum-ra-interval <3-1350> no ipv6 nd minimum-ra-interval (<3-1350>|)`

Parameter

`<3-1350>`	Minimum RA interval (in seconds).

Default

By default, RA interval is 180 seconds

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd minimum-ra-interval 400
(config-if)#no ipv6 nd minimum-ra-interval
```

ipv6 nd other-config-flag

Use this command to set the other stateful configuration flag in Router Advertisement to be used for IPv6 address autoconfiguration.

Use `no` parameter with this command to reset the value to default.

Command Syntax `ipv6 nd other-config-flag no ipv6 nd other-config-flag`

Parameters

None

Default

Other stateful configuration flag is not set.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd other-config-flag
(config-if)#no ipv6 nd suppress-ra
```

ipv6 nd prefix

Use this command to set IPv6 prefix information that is advertised for address auto-configuration.

Use `no` parameter with this command to remove an IPv6 prefix.

Command Syntax

```
          ipv6 nd prefix X:X::X:X/M <0-4294967295> <0-4294967295> (off-link|) (no-
  autoconfig|)
ipv6 nd prefix X:X::X:X/M ipv6 nd prefix valid-lifetime <0-
4294967295> ipv6 nd prefix preferred-lifetime <0-4294967295>
ipv6 nd prefix offlink ipv6 nd prefix no-autoconf no ipv6 nd
prefix X:X::X:X/M no ipv6 nd prefix valid-lifetime (<0-
4294967295>|) no ipv6 nd prefix preferred-lifetime (<0-
4294967295>|) no ipv6 nd prefix offlink no ipv6 nd prefix
no-autoconf
```

Parameters

`X:X::X:X/M` IPv6 prefix.

`<0-4294967295>` Valid lifetime in seconds. `<0-4294967295>` Preferred lifetime in seconds. `off-link` Do not use prefix for onlink determination. `no-autoconfig` Do not use prefix for autoconfiguration.

Default

By default, valid life time is 2592000 seconds and preferred life time is 604800 seconds

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Defaults

The default valid lifetime is 2592000 seconds.

The default preferred lifetime is 604800 seconds.

Examples

```
(config)#interface eth3
(config-if)#ipv6 nd prefix 2001:ffff::/64
```

```
(config)#interface eth3
(config-if)#ipv6 nd prefix no-autoconf

(config)#interface eth3
(config-if)#ipv6 nd prefix preferred-lifetime 550000
```

© Symanitron Proprietary

ipv6 nd ra-interval

Use this command to specify the interval between IPv6 Router Advertisements (RA).

Use `no` parameter with this command to set the value to its default.

Command Syntax `ipv6 nd ra-interval <4-1800> no ipv6 nd ra-interval`

Parameter

`<4-1800>`	RA interval in milliseconds.

Default

By default, RA interval is 600 milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd ra-interval 60
(config-if)#ipv6 nd prefix 3ffe:ffff:ffff::/64

(config-if)#no ipv6 nd ra-interval
```

ipv6 nd ra-lifetime

Use this command to specify the Router Advertisement (RA) lifetime for this device to act as a default gateway for the network.

Use `no` parameter with this command to reset the value to default.

Command Syntax `ipv6 nd ra-lifetime <0-9000> no ipv6 nd ra-lifetime`

Parameter

`<0-9000>`	RA lifetime duration in seconds.

Default

The default RA lifetime is 1800 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd ra-lifetime 9000 (config-if)#no
ipv6 ra-lifetime 9000
```

ipv6 nd reachable-time

Use this command to specify the reachable time in the Router Advertisement to be used for detecting unreachability of the IPv6 neighbor.

Use the `no` parameter with this command to set the value to its default.

Command Syntax `ipv6 nd reachable-time <0-3600000> no ipv6 nd reachable-time`

Parameter

`<0-3600000>`	Reachable time in milliseconds.

Default

By default, reachable time is zero (0) milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd reachable-time 1800000
(config-if)#no ipv6 nd reachable-time 1800000
```

ipv6 nd retransmission-time

Use this command to set an IPv6 advertised retransmission time for the current interface.

Use the `no` form of the command to set the retransmission time to its default value.

Command Syntax `ipv6 nd retransmission-time (0-4294967295) no ipv6 nd retransmission-time`

Parameter

`<0-4294967295>` Retransmission time in milliseconds

Default

By default, retransmission time is zero (0) milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd retransmission-time 1200
(config-if)#no ipv6 nd retransmission-time
```

ipv6 nd suppress-ra

Use this command to suppress IPv6 Router Advertisement (RA) transmission for the current interface. Router Advertisement is used for IPv6 stateless auto-configuration.

Use the `no` parameter with this command to enable Router Advertisement transmission.

Command Syntax `ipv6 nd suppress-ra (mtu |) no ipv6 nd suppress-ra (mtu |)`

Parameters `mtu` Do not send maximum transmission unit (MTU) in Router Advertisement messages

Default

By default, ipv6 nd suppress-ra is suppressed

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth3
```

```
(config-if)#ipv6 nd suppress-ra
```

ipv6 prefix-list

Use this command to create an entry for an ipv6 prefix-list.

Router starts to match prefixes from the top of the prefix list, and stops whenever a match or deny occurs. To promote efficiency, use the `seq` parameter and place common matches or denials towards the top of the list. The sequence values are generated in the sequence of 5.

The parameters `ge` and `le` specify the range of the prefix length to be matched.

Use the `no` parameter with this command to delete the prefix-list entry.

Command Syntax `ipv6 prefix-list WORD (deny|permit) (X:X::X:X/M|any) ipv6 prefix-list WORD (deny|permit) X:X::X:X/M ge <0-128> ipv6 prefix-list WORD (deny|permit) X:X::X:X/M ge <0-128> le <0-128> ipv6 prefix-list WORD (deny|permit) X:X::X:X/M le <0-128> ipv6 prefix-list WORD (deny|permit) X:X::X:X/M le <0-128> ge <0-128> ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) (X:X::X:X/M|any) ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M ge <0-128> ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M ge <0-128> le <0-128> ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M le <0-128> ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M le <0-128> ge <0-128> no ipv6 prefix-list WORD no ipv6 prefix-list WORD (deny|permit) (X:X::X:X/M|any) no ipv6 prefix-list WORD (deny|permit) X:X::X:X/M ge <0-128> no ipv6 prefix-list WORD (deny|permit) X:X::X:X/M ge <0-128> le <0-128> no ipv6 prefix-list WORD (deny|permit) X:X::X:X/M le <0-128> no ipv6 prefix-list WORD (deny|permit) X:X::X:X/M le <0-128> ge <0-128> no ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) (X:X::X:X/M|any) no ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M ge <0-128> no ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M ge <0-128> le <0-128> no ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M le <0-128> no ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M le <0-128> ge <0-128> ipv6 prefix-list sequence-number no ipv6 prefix-list sequence-number ipv6 prefix-list WORD description LINE no ipv6 prefix-list WORD description`

Parameters

WORD	Name of the prefix list.
deny	Reject packets.
permit	Accept packets.
X:X::X:X/M	IP address mask and length of the prefix list mask.
any	Take all packets of any length. This is the same as specifying ::/0 for X:X::X:X/M.
eg	Exact prefix length match
le	Maximum prefix length match
ge	Minimum prefix length match
<0-128>	Prefix length to match
<1-4294967295>	Sequence number of the prefix list.
sequence-number	To suppress sequence number generation, give the no ipv6 prefix-list sequence-number command. If you disable the generating sequence numbers, you must specify the sequence number for each entry using the sequence number parameter in the ipv6 prefix-list command. To enable sequence number generation, give the ipv6 prefix-list sequencenumber command.
LINE	Up to 80 characters describing this prefix-list.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ipv6 prefix-list mylist seq 12345 deny 3ffe:345::/16 le 22 ge 14
```

ipv6 unnumbered

Use this command to enable IPv6 processing without an explicit address, on a point-to-point non multi-access link.

This command lets an interface borrow the IPv6 address of a specified interface to enable IPv6 processing on a pointto-point interface without assigning it an explicit IPv6 address. In this way, the IPv6 unnumbered interface can borrow the IPv6 address of another interface already configured on the router to conserve network and address space.

Use the no parameter with this command to remove this feature on an interface.

Command Syntax `ipv6 unnumbered IFNAME no ipv6 unnumbered`

Parameter

`IFNAME` Interface name.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following example creates a tunnel on eth1:

```
#configure terminal
(config)#interface lo
(config-if)#ipv6 address::1/128
(config-if)#exit
(config)#interface eth1
(config-if)#ipv6 address fe80::20e:cff:fe6e:56dd/64
(config-if)#exit
(config)#interface Tunnel0
(config-if)#tunnel source 10.70.0.145
(config-if)#tunnel destination 10.70.0.77
(config-if)#tunnel ttl 255
(config-if)#tunnel path-mtu-discovery
(config-if)#tunnel mode gre
(config-if)#ipv6 unnumbered eth1
(config-if)#ipv6 router ospf area 0 tag 1
(config-if)#exit
(config)#router ipv6 ospf 1
(config-router)#router-id 10.70.0.145
```

link-flap errdisable

Use this command to shut down the interface when it continually goes up and down.

The link-flap ErrDisable feature must be enabled globally with the errdisable cause command.

Note: When link-flap ErrDisable is enabled globally, then all interfaces are enabled. Link-flap ErrDisable can be enabled globally, but disabled for a specific interface with the `no link-flap errdisable` command.

Note: This feature is supported only on physical ports.

Use the `no` form of this command to disable this behavior.

Command Syntax `link-flap errdisable no link-flap errdisable`

Parameter

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced in SWMRE version 1.3.4.

Example

```
#configure terminal
(config)#interface xe1/1
(config-if)#link-flap errdisable
```

load interval

Use this command to configure the interval for which average traffic rate need to be shown. Intervals can be configured in steps of 30 seconds.

Use the no parameter with this command to set the load interval to its default.

Command Syntax `load-interval <30-300> no load-interval`

Parameter

`<30-300>`	Load period in multiples of 30 seconds.

Default

By default, load interval is 300 seconds

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
```

```
(config)#interface xe1/1
(config-if)#load-interval 30
(config-if)#no load-interval
```

mtu

Use this command to set the Maximum Transmission Unit (MTU) for an interface.

Use the `no` parameter with this command to set the MTU to its default.

Command Syntax `mtu <64-65536> no mtu`

Parameter

`<64-65536>` Specify the size of MTU in bytes:

`<64-16338>` for L2 packet

`<576-9216>` for L3 IPv4 packet

`<1280-9216>` for L3 IPv6 packet

`<576-65536>` for IPv4 packet

`<1280-65536>` for IPv6 packet on loopback interface

Default

By default, MTU is 1500 bytes

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#mtu 120
```

multicast

Use this command to set the multicast flag for the interface.

Use the `no` form of this command to disable this function.

Command Syntax `multicast no multicast`

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#multicast
```

port breakout enable

Use this command to split a 40G interface to four 10G interfaces or 100G interface to four 10G or four 25G or two 50G interfaces without restarting the device.

You can only break out controlling ports. For example, in the group that contains the `xe1/1`, `xe1/2`, `xe1/3`, and `xe1/ 4` interfaces, the `xe1/1` interface is the controlling port (first port in the group) and `xe1/2`, `xe1/3`, and `xe1/4` are subsidiary ports (non control ports).

Ports that support the breakout feature display with a "/" in their name. By default, only control ports are active (/1) and remaining ports (/2, /3, and /4) are inactive.

Use the `show interface brief` command to verify if a port is controlling or subsidiary. You can also use the `show interface` command to check the flexport status. The status would be one of the below:

```
Flexport: Control Port (Active): Break Out disabled
Flexport: Control Port (Active): Break Out Enabled
Flexport: Non Control Port (InActive)
Flexport: Non Control Port (Active)
```

The output from commands such as `show running-config` reflect the split port configuration.

The bandwidth of a controlling port is reset to its maximum allowed speed after a split is enabled or disabled.

Any pre-configuration of the subsidiary port is applied directly once it becomes active.

Use the `no` form of this command to return the interface to single-port, 40G/100G operation.

Note: There are some configuration restrictions for Subsidiary ports such as:

1. Port breakout enable/disable is not allowed on Subsidiary ports.
2. Speed, Duplex configurations are not allowed on InActive Subsidiary ports.

Command Syntax

40G port:

```
port breakout enable
no port breakout
```

100G port:

```
port breakout enable (4x10g|4x25g|2x50g)
no port breakout
```

Parameters

`<4x10g>`	Split 100G to 4X10g
`<4x25g>`	Split 100G to 4X25g
`<2x50g>`	Split 100G to 2X50g

Default

By default, only control ports are active (/1) and remaining ports (/2, /3, and /4) are inactive.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

This example shows how to split a 40G port:

```
#configure terminal
(config)#interface xe1/1 (config-if)#port breakout enable (config-if)#end

#show running-config
!
no service password-encryption
!
logging monitor 7
!
ip vrf management
! forwarding profile l2-profile-two ip domain-lookup bridge 1 protocol rstp
vlan-bridge data-center-bridging enable bridge 1 ethernet cfm enable !

! interface xe1/1 port breakout enable switchport bridge-group 1
switchport mode access channel-group 1 mode active
! interface xe1/2  speed 1g
! interface xe1/3  speed 1g  switchport  bridge-group 2
switchport mode trunk
!
interface xe1/4 !
```

This example shows how to split a 100G port:

```
#configure terminal
(config)#interface ce1/1
(config-if)#port breakout enable ?
  2X50g  split to 2X50g
  4X10g  split to 4X10g
  4X25g  split to 4X25g
(config-if)#port breakout enable 4X25g
(config-if)#end
#show running-config
!
no service password-encryption
!
logging monitor 7
!
ip vrf management
! forwarding profile l2-profile-two ip domain-lookup bridge 1 protocol
rstp vlan-bridge data-center-bridging enable bridge 1

ethernet cfm enable
! interface ce1/1 port breakout enable 4X25g
```

Similarly, a 100G port can be split into 4x10G ports or 2x50G ports.

 © Symanitron Proprietary

port bundle enable

Use this command to bundle four 10G SFP+ interfaces into a single 40G interface without restarting the device. You can use this command only on bundle control ports.

For example, if the xe1 interface is bundle control port then this command can be used and following three ports xe2, xe3, and 4 would be subsidiary ports (non control ports) and would become inactive.

Use the show interface brief command to verify if a port is bundle controlling or subsidiary. You can also use the show interface command to check the flexport status. The status would be one of the below:

Flexport: Bundle Control Port (Active): Bundle disabled

Flexport: Bundle Control Port (Active): Bundle Enabled

Flexport: Non Control Port (InActive)

Flexport: Non Control Port (Active)

The output from commands such as show running-config reflect the bundle port configuration.

Use the `no` form of this command to revert to four 10G ports.

Note: There are some configuration restrictions for Subsidiary ports such as:

1. Port breakout enable/disable is not allowed on Subsidiary ports.
2. Speed, Duplex configurations are not allowed on InActive Subsidiary ports.

Command Syntax `port`

```
bundle enable no
port bundle
```

Parameters

None

Default

By default, ports are not bundled and all the ports are active (xe1, xe2, xe3, and xe4).

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

This example shows how to split a 40G port:

```
#show running-config
!
no service password-encryption
!
logging monitor 7
! ip vrf
management !
```

```
    forwarding
    profile l2-
    profile-two ip
    domain-lookup
    bridge 1
    protocol rstp
    vlan-bridge
    data-center-
    bridging enable
    bridge 1
    ethernet cfm
    enable
! !
interface xe1 port bundle enable
!
interface xe2
!
interface xe3
!
interface xe4 !
```

show interface

Use this command to display interface configuration and status information.

Command Syntax `show interface (IFNAME|)`

Parameter

IFNAME	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show interface xe1/1
Interface xe1/1
  Scope: both
  Flexport: Breakout Control Port (Active): Break Out Enabled
  Hardware is ETH  Current HW addr: ecf4.bb6e.934b
  Physical:ecf4.bb6e.934b  Logical:(not set)
  Port Mode is access
  Interface index: 5001
  Metric 1 mtu 1500 duplex-full(auto) link-speed 1g(auto)

output packets 437 bytes 28018     jumbo packets 0
    output errors 0 collision 0 deferred 0 late collision 0     output
discard 0
    Tx pause 0
```

Table 4-44 explains the output fields.

Table 4-44: show interface output details

Field	Description
Scope	Interface can be used for communication within the device and outside the device (Both).
Flexport	Specifies whether the ports has Breakout capabilities or is a Non-Control Port.
Breakout Control Port (Active)	Specifies whether Breakout is active or disabled.
Hardware is ETH Current HW addr	The MAC address of the interface.
Physical	Displays the physical MAC address of the interface.
Logical	Displays the logical MAC address (if any) of the interface.
Port Mode	Displays the port mode: Router, VLAN access, switch, or trunk.
Interface index	Index number, Metric, MTU size, duplex-full (auto) or half-duplex, minimum link speed in gigabits, and if the interface is up, broadcasting, and multicasting.
VRF Binding	Show whether the interface is VRF bound and (if bound) with what VRF, if Label Switching is enabled or disabled, and if a virtual circuit is configured.
DHCP client	The state of the DHCP client – whether this interface is connected to a DHCP server.
Last Flapped	Date and time when the interface last flapped.
Statistics last cleared	Date and time when the interface's statistics were cleared.
5 minute input rate	Input rate in bits/second and packets/second
5 minute output rate	Output rate in bits/second and packets/second
RX	Counters for unicast packets, multicast packets, broadcast packets, input packets, bytes, jumbo packets, runts, giants, CRC errors, fragments, jabbers, input errors, input with dribble input discards, and receive pause.
TX	Counters for unicast packets, multicast packets, broadcast packets, output packets, bytes, jumbo packets, output errors, collisions, differed packets, input late collisions, output discards, and transmit pause.

show interface counters

Use this command to display the ingress and egress traffic counters on the interface.

Note: Counters are meant for debugging purpose and the accuracy of the transmit discard counter is not guaranteed in all scenarios.

Command Syntax `show interface (IFNAME|) counters (active|)` `show interface cpu counters`

Parameter

`IFNAME`	Interface name.
`active`	Statistics for link-up interfaces.
`cpu`	CPU interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

This command is not available on Qumran platforms.

Example

```
#show interface xe1/1 counters
Interface xe1/1
  Scope: both
  Rx Packets: 1000
  Rx Bytes: 1000000
  Rx Unicast Packets: 1000
  Rx Packets from 512 to 1023 bytes: 1000
  Tx Packets: 3897
  Tx Bytes: 249408
  Tx Multicast Packets: 3897
  Tx Packets with 64 bytes: 3897
  Tx Packet rate: 1 pps
Tx Bit rate: 255 bps

#show interface cpu counters
CPU Interface
  Tx Packets: 104508
  Tx Bytes: 7106272
  Tx Discard Packets: 89613672
  Tx Discard Bytes: 5735237844
Rx Discard Packets: 11938
```

Table 4-45 explains the output fields.

Table 4-45: show interface counters output details

	Description
	Rx Packets Rx Bytes Rx Unicast Packets Rx Packets from 128 to 255 bytes Rx Discard Packet
	Tx Packets Tx Bytes Tx Multicast Packets Tx Packets from 65 to 127 bytes Tx Packets from 128 to 255 bytes
	Tx Packets Tx Bytes Tx Discard Packets Tx Discard Bytes Rx Discard Packets

show interface counters drop-stats

Use this command to display the ingress and egress traffic discard reason counters on the interface.

Note: You can only display statistics for physical ports and cpu ports, but not for the out-of-band management (OOB) management port or logical interfaces.

Note: Drops in the CPU queue are listed under `Tx Multicast Queue Drops`, whether the packet is unicast or multicast

Command Syntax `show interface (IFNAME|) counters drop-stats show interface cpu counters drop-stats`

Parameter

`IFNAME` Physical interface name `cpu`

CPU interface

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.1.

This command is not available on Qumran platforms.

Example

```
#show interface xe32/2 counters drop-stats
+---------------------+----------------+---------------- +--------------------+
| Counter Description | Count          | Last Increment | Last Increment Time
|
+---------------------+----------------+---------------- +--------------------+
 Rx Bad CRC errors     0                0
 Rx Undersize errors   0                0
 Rx Oversize errors    0                0
 Rx Fragments errors   0                0
 Rx Jabbers errors     0                0
 Rx Port Block Drops   6                1               2016 Nov 09 08:59:33
 Rx Vlan Discards      0                0
 Rx ACL/QOS Drops      0                0
 Rx Policy Discards    0                0
 Rx EGR Port Unavail   38784            5               2016 Nov 09 18:19:31
 Rx IBP Discards       0                0
 Tx Port Block Drops   359              1               2016 Nov 09 08:59:33
 Tx Vlan Discards      0                0
 Tx TTL Discards       0                0
 Tx Unknown Discards   359              1               2016 Nov 09 08:59:33
 Tx Ucast Queue Drops  0                0
 Tx Mcast Queue Drops  0                0
+---------------------+----------------+---------------- +--------------------+
```

Table 4-46 explains the output fields.

Table 4-46: show interface counters drop-stats output details

	Description
n	Shows the type of packet and/or the reason why the packet was dropped.
	The number of packets dropped for each reason.
	Number of packets dropped since this command was last entered.
me	Date and time when the last packet was dropped.
s	Received packets dropped because they didn't pass the cyclic Redundancy Check (CRC).
rs	Number of received runt packets dropped.
s	Number of received giant packets dropped
rs	Number of received packet fragments dropped
	Received packets dropped because of jabber – long packet error.
ps	Received packets dropped because port blocking is enabled.
	VLAN received packets dropped because there is no VLAN configured on the port.
ps	Received packets match a field processing entry with a drop or color drop action, such as: User-configured ACL that denies traffic Service policy with a police action that drops the traffic received at a rate higher than the configured limit.
s	Received packets dropped because of device policies violated, such as a storm control rate violation.

vail	No output port can be determined for these received packets. This counter increments along with other counter types in this table because it is a “catchall” for multiple types of discards as shown below: VLAN check failed MTU check failed ACL/QoS drops Policy discards Source MAC is null Destination IP/source IP address is null Source MAC address and destination MAC address are the same Forwarding lookup failure
	Ingress Back Pressure (ingress congestion) when the ingress packets buffer is full for an interface.
ps	Transmitted packets dropped because port blocking is enabled.
	Transmitted VLAN packets dropped because there is no VLAN configured on the port.
	Transmitted packets discarded because their Time To Live (TTL) has ended.

Table 4-46: show interface counters drop-stats output details (Continued)

	Description
n Discards	Transmitted packets dropped for unknown reason. May have something to do with the condition/configuration of the port at the other end of the connection.
ueue Drops	Transmitted packets dropped as a result of Unicast buffer overflow.
ueue Drops	Transmitted packets dropped as a result of Multicast buffer overflow.

show interface counters error-stats

Use this command to display the ingress error traffic counters on the interface.

Command Syntax `show interface (IFNAME|) counters error-stats`

Parameter

`IFNAME`	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show interface xe1/1 counters error-stats
   +----------+-------------+--------+----------+---------+-----------+---------+
|Interface |Total errors |Bad CRC |Undersize |Oversize | Fragments | Jabbers | +-
---------+-------------+--------+----------+---------+-----------+---------+
xe1/1      120           8        100        10        2           0
```

Table 4-47 explains the columns in the output.

Table 4-47: error traffic counters

Column	Description	Causes
Interface	Name of the interface	Point of interconnection in network.
Total errors	Total number of all types of errors	Number of errors in network.
Bad CRC	Number of packets received by the port from the network, where the packets have no CRC or a bad CRC.	Packet data modified making the CRC invalid.
Undersize	Total number of packets received that are less than 64 octets long (which exclude framing bits, but include the FCS) and have a good FCS value.	Bad frame generated by the connected device.
Oversize	Number of packets received by the port from the network, where the packets were more than maximum transmission unit size.	Faulty hardware, dot1q, or ISL trunking configuration issues.

Fragments	Total number of frames whose length is less than 64 octets (which exclude framing bits, but which include the FCS) and have a bad FCS value.	Ports are configured at half-duplex. Change the setting to full-duplex.
Jabbers	Total number of frames whose length is more than the maximum MTU size. (which exclude framing bits, but which include FCS) and have a bad FCS value.	Ports are configured at half-duplex. Change the setting to full-duplex.

show interface counters (indiscard-stats|outdiscard-stats)

Use this command to display the ingress and egress traffic discard reason counters on the interface.

Note: You can only display statistics for data ports and CPU ports, not for the out-of-band management (OOB) management port or logical interfaces.

Command Syntax `show interface (IFNAME|) counters (indiscard-stats|outdiscard-stats) show interface cpu counters (indiscard-stats|outdiscard-stats)`

Parameter

`IFNAME` Physical Interface name.

`indiscard-stats`

Discard reasons for ingress dropped packets.

`outdiscard-stats`

Discard reasons for egress dropped packets.

`cpu` CPU Interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

This command is not available on Qumran platforms.

Examples

```
#show interface xe1/3 counters indiscard-stats
+------------------- +----------------   +---------------- +--------------------- + |
Counter Description | Count          | Last Increment | Last Increment Time | +---
------------------+---------------- +--------------+-------------------                + STP
Discards          0                0  Vlan Discards          0                0
ACL Drops             0                0  Policy Discards        0                0
 EGR Port Unavail      1092867          1092867          2016 Oct 25 19:54:58
 IBP Discards          0                0
+------------------- +----------------   +---------------- +--------------------- +

```

Table 4-48 explain the fields in the command output.

Table 4-48: indiscard statistic output details

Statistic	Description
STP Discards	Packets received when the ingress interface is not in STP forwarding state.
Port Block Drops	Packets discarded on an ingress interface where port blocking is configured.
VLAN Discards	VLAN tagged packets received on a port which is not a member of the VLAN or untagged packets received on a trunk port.
ACL/QoS Drops	Incoming packets match a field processing entry with a drop or color drop action, such as: • User-configured ACL that denies traffic • Service policy with a police action that drops the traffic received at a rate higher than the configured limit
Policy Discards	Device policies violated, such as a storm control rate violation, source or destination discards when L2 tagged traffic received on router interface.
EGR (Egress) Port Unavail	No output port can be determined for this packet. This counter increments along with other counter types in this table because it is a “catchall” for multiple types of discards as shown below: • VLAN check failed • MTU check failed • ACL/QoS drops • Policy discards • Source MAC is null • Destination IP/source IP address is null • Source MAC address and destination MAC address are the same• Forwarding lookup failure

IBP Drops	Ingress Back Pressure (ingress congestion) when the ingress packet buffer is full for an interface.
Total Discards	Total number of ingress dropped packets.

Table 4-49 explain the fields in the command output.

Table 4-49: outdiscard statistics

Statistics	Description
Port Block Drops	Packets discarded on an egress interface where port blocking is configured.
VLAN Discards	Packets discarded because an invalid VLAN tag is encountered at an egress interface.

Table 4-49: outdiscard statistics

n
scarded because the Time-To Live (TTL) of the outgoing packet has passed.
scarded for other possible reasons like ACL drop in egress or a policer drop in egress. aused by congestion at queues and drops at queues are not counted under unknown
opped in the unicast queues because of congestion.
opped in the multicast queues because of congestion.
er of egress dropped packets.

show interface counters protocol

Use this command to display protocol packets received at the CPU by the control plane.

Command Syntax `show interface (IFNAME|) counters protocol`

Parameters

`IFNAME`	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.1.

This command is not available on Qumran platforms.

Example

```
#show interface counters protocol Interface ce1/1
lacp                 : 4   icmp6                :
5
```

Table 4-50 explain the fields in the command output.

Table 4-50: show interface counters protocol output details

Field	Description
Interface	Name of the configured interface.
lacp	Total number of lacp protocol in the interface.
icmp6	Total number of icmp6 protocol in the interface.

show interface counters queue-drop-stats

Use this command to display dropped packets in the CPU queue and the last increment time.

Command Syntax `show interface cpu counters queue-drop-stats`

Parameters

`cpu`	CPU interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in SWMRE version 1.3.2.

This command is not available on Qumran platforms.

Example `show interface cpu counters queue-drop-stats`

```
+-------------------+---------------+---------------+---------------------+      |
Queue Name     |     Count      | Last Increment | Last Increment Time | +----------
---------+----------------+----------------+---------------------+               arp
169735545        9145653          2017 Oct 23 14:33:54
```

Table 4-51 explain the fields in the command output.

Table 4-51: show interface counters queue-drop-stats output details

Field	Description
Queue Name	Name of the protocol.
Count	Number of arp protocols in the interface.
Last Increment	Final increment number in the protocol.
Last Increment time	Time of the last increment in the protocol.

show interface counters queue-stats

Use this command to display transmitted and dropped packet and byte counts of individual queues.

Command Syntax `show interface (IFNAME|) counters queue-stats show interface cpu counters queue-stats`

Parameters

`IFNAME`	Interface name.
`cpu`	CPU interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in SWMRE version 1.3.1.

This command is not available on Qumran platforms.

Example

```
#show interface counters queue-stats
D - Default Queue, U - User-defined Queue
+--------+---------------+------+-----------+-----------+-----------+---------------+
|Interface|Queue/Class-map|Q-Size|Output pkts|Output bytes|Dropped pkts|Dropped bytes  | +--------+-
```

```
                +------+-----------+------------ +------------ +---------------  + xe1/1     q1
(D) 0       12            1368          0             0 xe1/1     mc-q7          (D) 0       1            82
0              0 xe25       q1            (D) 0       6           684            0             0

#show interface xe1/1 counters queue-stats

```

Table 4-52 explain the fields in the command output.

Table 4-52: queue flags detail

Flag	Meaning
D	Default queue of the port.
U	User defined queue of the port.
E	Outgoing hello packet's queue in the port.
I	Incoming hello packet's queue in the port.
Q	Hello packet's queue size in bytes.

Table 4-53 explain the fields in the command output.

Table 4-53: show interface counters queue-stats output details

Field	Description
Interface	A defined physical interface to which the queue is associated.

Queue/Class-map	Queues associated with a QoS class-map.
Q-Size	The size of a specified queue in bytes.
Output pkts	The number of out bound packets residing in the queues.
Output Bytes	The number of bytes in the outbound queue.
Dropped pkts	The number of packets dropped because of queue overflow.
Dropped bytes	The number of bytes dropped because of queue overflow.
Tx pkts	The number of transmit packets contained in the out bound queue.
Tx bytes	The number of transmit bytes contained in the out bound queue.

show interface counters rate

Use this command to display the average traffic rate over the load interval of the interface.

Command Syntax `show interface (IFNAME|) counters rate (kbps|mbps|gbps|) show interface cpu counters rate (kbps|mbps|gbps|)`

Parameter

`IFNAME`	Interface name.
`kbps`	Kilobits per second.
`mbps`	Megabits per second.
`gbps`	Gigabits per second.
`cpu`	CPU interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

This command is not available on Qumran platforms.

Example

```
#show interface counters rate
+-------------+--------------------------+-------------------------------+ |
|              Rx           |               Tx               | |  Interface  |---
-----------------------+-------------------------------| |             |
```

```

CPU Queue(%)    |     Rx bps     |    Rx pps    |     Tx bps      |    Tx pps    | +-------
           +--------------+-------------+-------------+------------         +  isis
(   0%) -               -              742            0   arp           (   0%) -
-              6              0
```

Table 4-54 explain the fields in the command output.

Table 4-54: show interface counters rate output details

scription
e particular interface.
mber of hello packets received from the neighbor.
mber hello packets transmitted to the neighbor.
tes per second.
ckets per second.
U Queues used for various functions. In the example the CPU is maintaining queues for ARP and the S routing facilities.
e length of time for which data is used to compute load statistics.
mber of hello packets received from the neighbor in bytes per second.
mber of hello packets received from the neighbor in packets per second.
mber hello packets transmitted to the neighbor in bytes per second.
mber hello packets transmitted to the neighbor in packets per second.

show interface counters summary

Use this command to display the summary of traffic counters on a specific interface or all interfaces.

Note: This command is supported for the out-of-band management (OOB) management interface.

Command Syntax `show interface (IFNAME|) counters summary`

Parameter

`IFNAME`	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show interface xe1/1 counters summary
+-----------+------------------------------+-----------------------------+-------------------------+
Rx                  |              Tx                 | | Interface |-------------------------
                                        | |            |     packets     |     bytes       |
packets     |     bytes    | +-----------+---------------+---------------+---------------+--
------------    +   xe1/1        11032977        11032960000      61               3904

#show interface counters summary
+------------+--------------------+            +--------------------+   +-------------------+  +-------------------+             + |  Interface  |
Rx packets      |       Rx bytes       |     Tx packets      |       Tx bytes       | +-------------- +--------------------
+------------------+                +----------          +-------------------+          +
 eth0              206222                  13756391                235123                  337010937   po1
809121               72989094              825221              90605534  xe1/1          0                    0
1                     114  xe3/1        43                    4730                  21                   2298
xe5/1           29                     3178                  21                     2298   xe8            10
1076                  14                   1532  xe9/1          16                    1760                 21
2298    xe11/1          0                         0                      7                        766   xe19/1

68865557   xe32/4         7                    766                   7                    766
```

Table 4-55 explain the fields in the command output.

Table 4-55: show interface counters summary output details

	Description
	The particular interface.
	Number of hello packets received from the neighbor.

Number hello packets transmitted to the neighbor.
Bytes per second.
Packets per second.
Number of hello packets received from the neighbor in bytes per second.
Number of hello packets received from the neighbor in packets per second.
Number hello packets transmitted to the neighbor in bytes per second.
Number hello packets transmitted to the neighbor in packets per second.

show ip forwarding

Use this command to display the IP forwarding status.

Command Syntax `show ip forwarding`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following is a sample output of the `show ip forwarding` command displaying the IP forwarding status.

```
#show ip forwarding
vrf (management) :IP forwarding is on
vrf (default) :IP forwarding is on #
```

show ip interface

Use this command to display brief information about interfaces and the IP addresses assigned to them. To display information about a specific interface, specify the interface name with the command.

Command Syntax `show ip interface`

`brief show ip interface IFNAME`

`brief`

Parameters

`IFNAME` Interface name. `brief` Brief summary of IP status and configuration.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following is a sample output from the `show ip interface brief` command:

```
#show ip interface brief

'*' - address is assigned by dhcp client

Interface             IP-Address      Admin-Status          Link-
Status eth0                  *10.10.26.101   up                    up
lo                    127.0.0.1       up                    up
lo.management         127.0.0.1       up                    up xe1/1
10.1.1.1        up                     up xe1/2
unassigned      down                   down xe1/3
unassigned      down                   down xe1/4
unassigned      down                   down xe2
unassigned      up                     down xe3/1
unassigned      up                     up xe3/2
unassigned      down                   down xe3/3
unassigned      down                   down
```

Table 4-56 explain the fields in the command output.

Table 4-56: show ip interface output details

Field	Description

Interface	Interface name, also specifies interface type (eth0, lo, xe1/1, and xe1/2).
IP-Address	The IP address assigned to the interface. An asterisks indicates that the IP address was provided by DHCP.

Table 4-56: show ip interface output details (Continued)

	Description
	Interface is up and functioning or down.
	Interface is connected and passing traffic.

show ip prefix-list

Use this command to display the prefix list entries for IPv4 interfaces.

Syntax Description `show ip prefix-list show ip prefix-list WORD show ip prefix-list WORD seq <1-4294967295> show ip prefix-list WORD A.B.C.D/M show ip prefix-list WORD A.B.C.D/M longer show ip prefix-list WORD A.B.C.D/M first-match show ip prefix-list summary show ip prefix-list summary WORD show ip prefix-list detail show ip prefix-list detail WORD`

Parameters

`WORD` Name of a prefix list.

`A.B.C.D/M` IP prefix <network>/<length> (for example, 35.0.0.0/8).

`first-match` First matched prefix. `longer` Lookup longer prefix.

`<1-4294967295>` Sequence number. `detail` Detail of prefix lists. `summary` Summary of prefix lists.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following is a sample output of the `show ip prefix-list` command showing prefix-list entries.

```
#show ip prefix-list
ip prefix-list myPrefixList: 3 entries    seq
5 permit 172.1.1.0/16    seq     10 permit
173.1.1.0/16    seq     15 permit 174.1.1.0/16
```

show ip route

Use this command to display the IP routing table for a protocol or from a particular table.

When multiple entries are available for the same prefix, NSM uses an internal route selection mechanism based on protocol administrative distance and metric values to choose the best route. All best routes are entered into the FIB and can be viewed using this command. To display *all* routes (selected and not selected), use the `show ip route database` command.

Command Syntax `show ip route A.B.C.D show ip route A.B.C.D/M`

`show ip route (database|) show ip route (database|)`

`(bgp|connected|database|isis|fast-`

`reroute|interface|isis|kernel|mbgp|mstatic|next-hop|ospf|rip|static)`

`show ip route summary show ip route`

`vrf WORD (database|)`

`show ip route vrf WORD (database|) (bgp|connected|isis|kernel|ospf|rip|static)`

Parameters

`A.B.C.D`	Network in the IP routing table.
`A.B.C.D/M`	IP prefix <network>/<length>, for example, 35.0.0.0/8.
`bgp`	Border Gateway Protocol.
`connected`	Connected.
`database`	Routing table database.
`fast-reroute`	Fast reroute repair paths.
`interface`	Interface.
`isis`	IS-IS.
`kernel`	Kernel.
`mbgp`	Multiprotocol BGP routes.
`mstatic`	Multicast static routes.
`next-hop`	Next hop address.
`ospf`	Open Shortest Path First.
`rip`	Routing Information Protocol.
`static`	Static routes.
`summary`	Summarize all routes.
`WORD`	Routes for a Virtual Routing/Forwarding instance.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example: Display FIB Routes

The following shows output for the best routes.

```
#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter
       area * - candidate default
Gateway of last resort is 10.30.0.11 to network 0.0.0.0
```

```
K*      0.0.0.0/0 via 10.30.0.11, eth0
O       9.9.9.9/32 [110/31] via 10.10.31.16, eth2, 00:18:56
K10.10.0.0/24 via 10.30.0.11, eth0
C10.10.31.0/24 is directly connected, eth2
S10.10.34.0/24 [1/0] via 10.10.31.16, eth2
O10.10.37.0/24 [110/11] via 10.10.31.16, eth2, 00:20:54
C10.30.0.0/24 is directly connected, eth0
S11.22.11.0/24 [1/0] via 10.10.31.16, eth2
O E214.5.1.0/24 [110/20] via 10.10.31.16, eth2, 00:18:56
S16.16.16.16/32 [1/0] via 10.10.31.16, eth2
O17.17.17.17/32 [110/31] via 10.10.31.16, eth2, 00:20:54
C45.45.45.45/32 is directly connected, lo
O55.55.55.55/32 [110/21] via 10.10.31.16, eth2, 00:20:54
C127.0.0.0/8 is directly connected, lo
```

Header

Each entry in this table has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route and K indicates that the route has been learned from the kernel. Table 4-57 shows these codes and modifiers.

Table 4-57 explain the fields in the command output.

Table 4-57: route codes and modifiers

Code	Meaning	Description
K	kernel	Routes added through means other than by using the CLI; for example by using the operating system route command. Static routes added using kernel commands and static routes added using SWMRE commands are different. The kernel static routes are not redistributed when you give the `redistribute static` command in a protocol. However, the kernel static routes can be redistributed using the `redistribute kernel` command.
C	connected	Routes directly connected to the local device that were not distributed via IGP. The device inherently knows of these networks, so there is no need to learn about these from another device. Connected routes are preferred over routes for the same network learned from other routing protocols. Routes for connected networks always exist in the kernel routing table but as an exception are not marked as kernel routes because SWMRE always calculates entries for these routes upon learning interface information from the kernel.
S	static	Routes manually configured via CLI which are not updated dynamically by IGPs.
The codes below are for routes received and dynamically learned via IGP neighbors. These networks are not directly connected to this device and were announced by some other device on the network. IGPs update these routes as the network topology changes.		
R	RIP	

B	BGP	
O	OSPF	Modifiers for OSPF: IA - OSPF inter area N1 - OSPF NSSA external type 1 N2 - OSPF NSSA external type 2 E1 - OSPF external type 1 E2 - OSPF external type 2
i	IS-IS	Modifiers for IS-IS: L1 - IS-IS level-1 L2 - IS-IS level-2 ia - IS-IS inter area
Other modifiers:		
v	vrf leaked	The device has two or more VRFs configured and each has at least one interface bound to it. While each VRF will have its own routing table, the VRFs can learn each other's routes.
*	candidate default	Route has been added to the FIB. With equal cost paths to a destination, the router does per-packet or per-destination load sharing. An asterisk ("*") means that the route is being used at that instant for forwarding packets. If you run the same `show ip route x.x.x.x` command over and over, you might see the * moving between the route entries.
>	selected route	When multiple routes are available for the same prefix, the best route. When multiple entries are available for the same prefix, SWMRE uses an internal route selection mechanism based on protocol administrative distance and metric values to choose the best route. SWMRE populates the FIB with the *best* route to each destination
p	stale info	

After the codes, the header has default gateway information:

```
Gateway of last resort is 10.12.4.1 to network 0.0.0.0
```

The "gateway of last resort", also called the default gateway, is a static route that routes IP address 0.0.0.0 (all destinations) through a single host (the gateway). The effect of setting a gateway is that if no routing table entry exists for a destination address, packets to that address will be forwarded to the gateway router.

Route Entry Fields

Table 4-58 explains the each route entry fields.

Table 4-58: route entry output details

Field	Description
Codes and modifiers	As explained in Table 4-57.

IP address	IP address of the remote network.
Administrative distance and metric	The administrative distance determines how trustworthy this route is. If there is a similar route but with a smaller administrative distance, it is used instead, because it is more “trustworthy”. The smaller the administrative distance, the more trustworthy the route. Directly connected routes have an administrative distance of 0, which makes them the most trustworthy type of route.The metric varies from protocol to protocol, and for OSPF the metric is cost, which indicates the best quality path to use to forward packets. Other protocols, like RIP, use hop count as a metric. For neighboring routers, the metric value is 1.
Next hop router IP address	This route is available through the next hop router located at this IP address. This identifies exactly where packets go when they match this route.
Outgoing interface name	Interface used to get to the next-hop address for this route.
Duration	Length of time that this route has been present in the routing table. This is also the length of time this route has existed without an update. If the route were removed and then re-added (if the cable was disconnected, for instance), this timer would begin again at 00:00:00.

Route Entry Examples

```
O       10.10.37.0/24 [110/11] via 10.10.31.16, eth2, 00:20:54
```

- This route in the network 10.10.37.0/24 was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via nexthop 10.10.31.16.
- The outgoing local interface for this route is eth2.
- This route was added 20 minutes and 54 seconds ago.

```
O E2    14.5.1.0/24 [110/20] via 10.10.31.16, eth2, 00:18:56
```

- This route is the same as the other OSPF route above; the only difference is that it is a Type 2 External OSPF route.

```
C       10.10.31.0/24 is directly connected, eth2
```

- This route is directly connected.
- Route entries for network 10.10.31.0/24 are derived from the IP address of local interface eth2.

```
K10.10.0.0/24 via 10.30.0.11, eth0
```

- This route in the network 10.10.0.0/24 was learned from the kernel routing table (route was statically added using kernel commands).
- This route is reachable via nexthop 10.30.0.11.
- The outgoing local interface for this route is eth0.

```
K*      0.0.0.0/0 via 10.30.0.11, eth0
```

- This is a default route that was learned from the kernel (route was statically added using kernel commands).
- This route is reachable via nexthop 10.30.0.11.
- The local interface for this route is eth0.

Example: Display OSPF Routes

The following is the output with the `ospf` parameter:

```
#show ip route ospf
O       1.1.1.0/24 [110/20] via  2.2.2.1, eth2, 00:00:44
O IA    4.4.4.0/24 [110/21] via  2.2.2.1, eth2, 00:00:44 #
```

Example: Display Route Summary

The following is the output with the `summary` parameter.

```
#show ip route summary
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source    Networks
kernel          1
connected       5 ospf
2 Total           8
FIB             2
```

Example: Display RIB Routes

The following shows displaying database routes.

```
#show ip route database
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF  NSSA  external  type 1, N2  -  OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter
       area > - selected route, * - FIB route, p - stale info

K    *> 0.0.0.0/0 via 10.30.0.11, eth0
O    *> 9.9.9.9/32 [110/31] via 10.10.31.16, eth2, 00:19:21
K*> 10.10.0.0/24 via 10.30.0.11, eth0
O10.10.31.0/24 [110/1] is directly connected, eth2, 00:28:20
C*> 10.10.31.0/24 is directly connected, eth2
S*> 10.10.34.0/24 [1/0] via 10.10.31.16, eth2
O10.10.34.0/24 [110/31] via 10.10.31.16, eth2, 00:21:19
O*> 10.10.37.0/24 [110/11] via 10.10.31.16, eth2, 00:21:19
K*  10.30.0.0/24 is directly connected, eth0
C*> 10.30.0.0/24 is directly connected, eth0
S*> 11.22.11.0/24 [1/0] via 10.10.31.16, eth2
O E2 *> 14.5.1.0/24 [110/20] via 10.10.31.16, eth2, 00:19:21
O16.16.16.16/32 [110/11] via 10.10.31.16, eth2, 00:21:19
S*> 16.16.16.16/32 [1/0] via 10.10.31.16, eth2
O*> 17.17.17.17/32 [110/31] via 10.10.31.16, eth2, 00:21:19
C*> 45.45.45.45/32 is directly connected, lo
O*> 55.55.55.55/32 [110/21] via 10.10.31.16, eth2, 00:21:19
K*  127.0.0.0/8 is directly connected, lo
C*> 127.0.0.0/8 is directly connected, lo
```

The codes and modifier at the start of each route entry are explained in Table 4-57.

Routes in the FIB are marked with a *. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. Unselected routes have neither the * nor the > symbol.

Route Database Entry Examples

This example shows 2 entries in the route database; one learned from the kernel and the other derived from interface information.

```
K    * 10.30.0.0/24 is directly connected, eth0
C *> 10.30.0.0/24 is directly connected, eth0
```

- Both these routes are in the same network 10.30.0.0/24.
- The first route has originated from the kernel. The * indicates that it has been added to the FIB.
- The second route is derived from the IP address of local interface eth0. It is marked as a connected route. Since a connected route has the lowest administrative distance, it is the selected route.

```
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, eth2
O       10.10.34.0/24 [110/31] via 10.10.31.16, eth2, 00:21:19
```

- The same prefix was learned from OSPF and from static route configuration.
- Static routes are preferred over OSPF routes, so the static route is selected and installed in the FIB.

  Note: If the static route becomes unavailable, SWMRE automatically selects the OSPF route and installs it in the FIB.

show ip vrf

This command displays routing information about VRFs.

Command Syntax `show ip vrf show ip vrf WORD`

Parameter

`WORD`	Virtual Routing and Forwarding name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ip forwarding vrf (management) :IP forwarding is on vrf (default)
:IP forwarding is on
```

show ipv6 forwarding

Use this command to display the IPv6 forwarding status.

Command Syntax `show ipv6 forwarding`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following is a sample output of the `show ipv6 forwarding` command displaying the IPv6 forwarding status.

```
#show ipv6 forwarding
 vrf (management) :IPv6 forwarding is on vrf
(default) :IPv6 forwarding is on#
```

show ipv6 interface brief

Use this command to display information about interfaces. To display information about a specific interface, include the interface name.

Command Syntax `show ipv6 interface brief show ipv6 interface IFNAME brief`

Parameters

`IFNAME`	Name of the interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ipv6 interface brief
Interface           IPv6-Address                Admin-Status lo

::1                          [up/up] gre0                unassigned

[admin down/down]

eth3                3ffe:abcd:104::1            [up/up]
                    3ffe:abcd:103::1

fe80::2e0:29ff:fe6f:cf0 eth1               fe80::260:97ff:fe20:f257

[up/up] eth2                  unassigned                       [admin

down/down] eth3                 unassigned                     [admin

down/down] sit0                 unassigned                     [admin

down/down] tun24                unassigned                     [admin

down/down]

tun10               unassigned                  [admin down/down]
```

Table 4-59 explains the each interface brief entry.

Table 4-59: show interface brief output details

scription

me of the interface.
v6 address. An asterisk (“*”) means the address was assigned by the DHCPv6 client.
atus of the interface: e first part of the field indicates if the interface is up. e second part indicates if the interface is running.

show ipv6 route

Use this command to display the IP routing table for a protocol or from a particular table, including database entries known by NSM. When multiple entries are available for the same prefix, NSM uses an internal route selection mechanism based on protocol administrative distance and metric values to choose the best route. The best routes in the FIB can be viewed using `show ipv6 route`.

Command Syntax `show ipv6 route vrf WORD (database|) show ipv6 route vrf WORD (database|) (bgp|connected|isis|kernel|ospf|rip|static) show ipv6 route (database) show ipv6 route (database) (bgp|connected|isis|kernel|ospf|rip|static) show ipv6 route X:X::X:X show ipv6 route X:X::X:X/M show ipv6 route summary`

Parameters

`X:X::X:X`	Network in the IP routing table.
`X:X::X:X/M`	Prefix <network>/<length>, e.g., 35.0.0.0/8
`all`	All IPv6 routes
`bgp`	Border Gateway Protocol.
`connected`	Connected.
`database`	IPv6 routing table database.
`isis`	IS-IS.
`IFNAME`	Interface name
`kernel`	Kernel.
`ospf`	Open Shortest Path First.
`rip`	Routing Information Protocol.
`static`	Static routes.
`summary`	Summarize all routes
`WORD`	Routes from a Virtual Routing and Forwarding instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

See Table 4-57 and Table 4-58 for an explanation of the codes and fields in the output.

```
    #show ipv6 route
      Codes: K - kernel route, C - connected, S - static, R - RIPng, O - OSPFv3,
        I - IS-IS, B - BGP, > - selected route, * - FIB route, p - stale info.
C> * ::1/128 is directly connected, lo
C> * 3ffe:1::/48 is directly connected, eth1
C> * 3ffe:2:2::/48 is directly connected, eth2 #
```

show ipv6 prefix-list

Use this command to display the prefix list entries for IPv6 interfaces.

Syntax Description `show ipv6 prefix-list show ipv6 prefix-list WORD show ipv6 prefix-list WORD seq <1-4294967295> show ipv6 prefix-list WORD X:X::X:X/M show ipv6 prefix-list WORD X:X::X:X/M longer show ipv6 prefix-list WORD X:X::X:X/M first-match show ipv6 prefix-list summary show ipv6 prefix-list summary WORD show ipv6 prefix-list detail show ipv6 prefix-list detail WORD`

Parameters

`WORD` Name of prefix list.

`X:X::X:X/M` IP prefix <network>/<length> (for example, 35.0.0.0/8). `first-match` First matched prefix. `longer` Look up longer prefix.

`<1-4294967295>`

Sequence number of an entry.

`detail` Detail of prefix lists. `summary` Summary of prefix lists.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following is a sample output of the `show ip prefix-list` command showing prefix-list entries.

```
#show ip prefix-list
ip prefix-list myPrefixList: 3 entries    seq
5 permit 172.1.1.0/16    seq     10 permit
173.1.1.0/16    seq     15 permit 174.1.1.0/16
```

show hosts

Use this command to display the IP domain-name, lookup style and any name server.

Command Syntax `show hosts`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show hosts
```

show running-config interface

Use this command to show the running system status and configuration for a specified interface, or a specified interface for a specified protocol.

Command Syntax `show running-config interface IFNAME show running-config interface IFNAME bridge show running-config interface IFNAME dot1x show running-config interface IFNAME ip igmp show running-config interface IFNAME ip multicast show running-config interface IFNAME ip pim show running-config interface IFNAME ipv6 ospf show running-config interface IFNAME ipv6 rip show running-config interface IFNAME ipv6 pim show running-config interface IFNAME isis show running-config interface IFNAME lacp show running-config interface IFNAME ldp show running-config interface IFNAME mpls show running-config interface IFNAME mstp show running-config interface IFNAME ospf show running-config interface IFNAME ptp show running-config interface IFNAME rip show running-config interface IFNAME rstp show running-config interface IFNAME rsvp show running-config interface IFNAME stp show running-config interface IFNAME synce show running-config interface IFNAME trill`

Parameters

`bridge`	Bridge.
`dot1x`	IEEE 802.1X port-based access control.
`ip`	IPv4 (see also show running-config interface ip).
`ipv6`	IPv6 (see also show running-config interface ipv6).
`isis`	Intermediate System to Intermediate System.
`lacp`	Link Aggregation Control Protocol.
`ldp`	Label Distribution Protocol.
`mpls`	Multi-Protocol Label Switching.
`mstp`	Multiple Spanning Tree Protocol.

`ospf` Open Shortest Path First. `ptp` Precision Time Protocol. `rip` Routing Information Protocol. `rstp` Rapid Spanning Tree Protocol. `rsvp` Resource Reservation Protocol. `stp` Spanning Tree Protocol. `synce` Synchronous Ethernet. `trill` Transparent Interconnection of Lots of Links.

Command Mode

Privileged Exec mode and Config Mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show running-config interface eth1 bridge
! interface eth1
switchport bridge-group 1
switchport mode access
user-priority 3
 traffic-class-table user-priority 2 num-traffic-classes 3 value 3 trafficclass-
table user-priority 7 num-traffic-classes 1 value 2 traffic-class-table user-
priority 7 num-traffic-classes 2 value 0 traffic-class-table userpriority 7 num-
traffic-classes 3 value 0 traffic-class-table user-priority 7 num-traffic-
classes 4 value 0 traffic-class-table user-priority 7 num-trafficclasses 5 value
0 traffic-class-table user-priority 7 num-traffic-classes 6
```

show running-config interface ip

Use this command to show the running system status and configuration for a specified IP.

Command Syntax `show running-config interface IFNAME ip (igmp|multicast|pim|)`

Parameters

`IFNAME`	Interface name.
`igmp`	Internet Group Management Protocol.
`multicast`	Multicast.
`pim`	Protocol Independent Multicast.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show running-config interface eth1 ip igmp
! interface eth1 switchport
```

show running-config interface ipv6

Use this command to show the running system status and configuration for a specified IPv6 protocol.

Command Syntax `show running-config interface IFNAME ipv6 (mld|multicast|ospf|pim|rip|)`

Parameters

`IFNAME`	Interface name.
`mld`	Multicast Listener Discovery
`multicast`	Multicast
`ospf`	Open Shortest Path First
`pim`	Protocol Independent Multicast
`rip`	Routing Information Protocol

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show running-config interface eth1 ipv6 rip
! interface
eth1 switchport
```

show running-config ip

Use this command to show the running system of IP configurations.

Command Syntax `show running-config ip (dhcp|mroute|route)`

Parameters

`dhcp`	Dynamic Host Configuration Protocol.
`mroute`	Static IP multicast route.
`route`	Static IP route.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show running-config ip route
! ip route 3.3.3.3/32 eth3 ip route 3.3.3.3/32 eth2 ip
route 200.0.0.0/16 lo !
```

show running-config ipv6

Use this command to show the running system status and configuration for IPv6.

Command Syntax `show running-config ipv6 (access-list|mroute|neighbor|prefix-list|route|)`

Parameters

`access-list`	Access list.
`mroute`	Static IPv6 Multicast route.
`neighbor`	Static IPv6 neighbor entry.
`prefix-list`	IPv6 prefix-list.
`route`	Static IPv6 route.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show running-config ipv6 access-list
!
ipv6 access-list abc permit any
!
#show running-config ipv6 prefix-list
!
ipv6 prefix-list sde seq 5 permit any
!
#show running-config ipv6 route
!
ipv6 route 3e11::/64 lo ipv6 route
3e11::/64 eth2 ipv6 route
fe80::/64 eth2 !
```

shutdown

Use this command to shut down an interface.

Use the `no` form of this command to bring up an interface.

Command Syntax `shutdown`

`no shutdown`

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following example shows the use of the `shutdown` command to shut down the interface called `eth3`.

```
#configure terminal
(config)#interface eth3
(config-if)#shutdown
```

speed

Use this command to set the link speed of the interface.

Use the `no` parameter to set the speed to its default value.

On Trident2 and Trident2+ switches, even if a fiber port is running at a variable 10M/100M/1G auto-negotiated speed, if you give this command to manually set the speed to less than 1G, the speed is always set to 1G. However, the show interface command displays the speed of such ports as set by you.

If a switch has copper ports and you set the speed using this command, the link goes down. For these switches, only use auto-negotiated port speeds.

Note: If a 1G copper SFP is inserted, auto-negotiation should be disabled and the port speed should be configured as 1G by using the command: `speed 1g`. This is necessary because even if auto-negotiation is disabled on the board, the external PHYs on 1G copper SFPs will still auto-negotiate with their peers for 1G port speed.

Command Syntax

```
speed (10m | 100m | 1g | 2.5g | 10g | 20g | 25g | 40g | 50g | 100g |
  (auto (1g | 10g | 20g | 25g | 40g | 50g | 100g |)))
no speed
```

Parameter

`10m`	10 megabits
`100m`	100 megabits
`1g`	1 gigabit
`2.5g`	2.5 gigabits
`10g`	10 gigabits
`20g`	20 gigabits
`25g`	25 gigabits
`40g`	40 gigabits

`50g`	50 gigabits
`100g`	100 gigabits
`auto`	Negotiate the speed with a connected port

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

Configure forced speed to 10G:

```
#configure terminal
(config)#interface xe0
(config-if)#speed 10g
```

Enable auto-negotiation:

```
#configure terminal
(config)#interface xe0
(config-if)#speed auto
```

Enable auto-negotiation up to 10G:

```
#configure terminal
(config)#interface xe0
(config-if)#speed auto 10g
```

switchport

Use this command to set the mode of an interface to switched.

All interfaces are configured `routed` by default. To change the behavior of an interface from switched to routed, you must explicitly give the `no switchport` command.

Note: When you change the mode of an interface from switched to routed and vice-versa, all configurations for that interface are erased.

User should be prompted for confirmation, while executing `switchport/no switchport` command. To support this requirement, please refer the command `enable/disable confirmation-dialog.`

Use the `no` form of this command to set the mode to routed.

Command Syntax

```
switchport
no
switchport
```

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth0 (config-
if)#switchport

(config)#interface eth0
(config-if)#no switchport

#configure terminal
(config)#enable confirmation-dialog
(config)#interface xe5
(config-if)#switchport
Are you sure? (y/n): y
(config-if)#
(config-if)#exit

(config)#disable confirmation-dialog
(config)#
```

```
(config)#interface xe5
(config-if)#switchport
(config-if)#
```

switchport allowed ethertype

Use this command to indicate which types of traffic will be allowed on the switchport.

Note: A maximum of 5 Ethertype values can be assigned on an interface.

Command Syntax `switchport allowed ethertype {arp|ipv4|ipv6|mpls|ETHTYPE|log}`

Parameters

`arp`	ARP traffic
`ipv4`	IPv4 traffic
`ipv6`	IPv6 traffic
`mpls`	MPLS traffic
`ETHTYPE`	Traffic of any Ethertype value (0x600 - 0xFFFF).
`log`	Log unwanted ethertype packets.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
(config)#interface xe32/1

(config-if)#switchport
(config-if)#switchport allowed ethertype ipv4
(config-if)#switchport allowed ethertype 0x800
```

CHAPTER 5 Access Control List Commands

This chapter is a reference for the Access Control List (ACL) commands:

- access-list logging cache-size
- access-list logging rate-limit
- clear access-list log-cache
- clear access-list
- clear ip access-list
- clear ipv6 access-list
- clear mac access-list
- ip access-group
- ip access-list default
- ip access-list icmp
- ip access-list filter
- ip access-list fragments
- ip access-list remark
- ip access-list resequence
- ip access-list tcp|udp
- ip access-list WORD
- ipv6 access-list default
- ipv6 access-list filter
- ipv6 access-list fragments
- ipv6 access-group
- ipv6 access-list icmpv6
- ipv6 access-list remark
- ipv6 access-list resequence
- ipv6 access-list sctp
- ipv6 access-list tcp|udp
- ipv6 access-list WORD
- mac access-group
- ip access-list default
- mac access-list filter
- mac access-list remark
- mac access-list resequence
- mac access-list WORD
- show access-lists

- show access-list log-cache
- show ip access-lists
- show ipv6 access-lists
- show mac access-lists
- show running-config aclmgr
- show running-config access-list
- show running-config ipv6 access-list

access-list logging cache-size

Use this command to set the ACL logging table size.

Use no command to set the table size to its default.

Command Syntax `access-list logging cache-size <1000-10000> no access-list logging cache-size`

Parameters

`<1000-10000>` Maximum number of cache entries

Default

By default, logging table size is 1000.

Command Mode

Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#access-list logging cache-size 2000
(config)#end
```

access-list logging rate-limit

Use this command to set the rate limit for logging ACL denied packets.

Use no command to reset the rate to default.

Command Syntax `access-list logging rate-limit <0-1000> no access-list logging rate-limit`

Parameters

`<0-1000>` Packets per second

Default

By default, rate is 200 packets per second.

Command Mode

Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#access-list logging rate-limit 500
(config)#end
```

clear access-list log-cache

Use this command to clear the access-list logging table.

Command Syntax `clear access-list log-cache`

Parameters

None

Command Mode

Exec mode and Privilege exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear access-list log-cache
```

clear access-list

Use this command to clear the access-list counters.

Command Syntax `clear access-list (WORD|) counters`

Parameters

`WORD`	Access-list name.

Command Mode

Exec mode and Privilege exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear access-list counters
```

clear ip access-list

Use this command to clear the IP access-list counters.

Command Syntax `clear ip access-list (WORD|) counters`

Parameters

`WORD`	Access-list name.

Command Mode

Exec mode and Privilege exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear ip access-list counters
```

clear ipv6 access-list

Use this command to clear the IPv6 access-list counters.

Command Syntax `clear ipv6 access-list (WORD|) counters`

Parameters

`WORD`	Access-list name.

Command Mode

Exec mode Privilege exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear ipv6 access-list counters
```

clear mac access-list

Use this command to clear the MAC access-list counters.

Command Syntax `clear mac access-list (WORD|) counters`

Parameters

`WORD`	Access-list name.

Command Mode

Exec mode Privilege exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear mac access-list counters
```

ip access-group

Use this command to attach IP access list to an interface to filter incoming or outgoing packets.

When you attach an access list to a VLAN interface or LAG interface as well as to a physical interface that is a member of that LAG and/or VLAN interface, the priority order is:

1. VLAN interface
2. LAG interface
3. Physical interface

For example, if you attach access lists to both a LAG interface and a physical interface that is a member of that LAG, matching traffic rules are applied to the LAG interface, but not to the physical interface.

Use the `no` parameter with this command to detach an IP access group.

Note: Access-group on egress direction uses the TCAM group used by QoS output service policy. Hence, actions will be unpredictable when conflicting matches are configured on same interface. It is recommended to avoid such configuration. Otherwise user need to configure priority (in QoS) / sequence number (in ACL) carefully to tackle such cases.

W
O
R
D
(
i
n
|
o
u
t
)
```

Parameters

WORD	Access list name.
in	Filter incoming packets (not supported on Qumran platform)
out	Filter outgoing packets.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip access-list mylist
(config-ip-acl)#permit ip any any
(config-ip-acl)#exit

(config)#interface eth3
(config-if)#ip access-group mylist in
(config-if)#exit

(config)#interface eth3
```

```
(config-if)#no ip access-group mylist in
(config-if)#exit
```

ip access-list default

Use this command to modify the default rule action of access-list. Default rule is applicable only when access-list is attached to interface. Default rule will have the lowest priority and only the packets not matching any of the user defined rules match default rule.

Command Syntax `default (deny-all|permit-all) (log|) (sample|)`

Parameters

`deny-all`	Drop all packets.
`permit-all`	Accept all packets.
`log`	Log the packets matching the filter (in-direction only).
`Sample`	Sample the packets matching the filter (in-direction only).

Default

No default value is specified

Command Mode

IP access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Log feature is supported only with deny rules. Sample feature is supported only with permit rules. Feature is not supported on Qumran platforms.

Examples

```
#configure terminal
(config)#ip access-list ip-acl-01
(config-ip-acl)#default permit-all sample
```

ip access-list icmp

Use this command to permit or deny ICMP packets based on the given source and destination IP address. Even DSCP, precedence and fragment number can be configured to permit or deny with the given values.

Use the no form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|)(deny|permit) (icmp) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
  (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any) (administratively-prohibited|
   alternate-address| conversion-error|dod-host-prohibited| dod-net-prohibited| echo|
echo-reply|general-parameter-problem| host-isolated| host-precedence-

  reply|mask-request| mobile-redirect| net-redirect| net-tos-redirect|net-tos-
  unreachable| net-unreachable| network-unknown| no-room-for-option|option-missing|
  packet-too-big| parameter-problem| port-unreachable|precedence-unreachable|
  protocol-unreachable| reassembly-timeout| redirect|router-advertisement| router-
  solicitation| source-quench|source-route-failed|time-exceeded| timestamp-reply|
  timestamp-request| traceroute|ttl-exceeded|unreachable|(<0-255> (<0-255>|))|)
  ("dscp (<0-63>|af11| af12| af13| af21| af22| af23| af31|af32| af33| af41| af42|
  af43| cs1| cs2| cs3| cs4| cs5|cs6| cs7| default| ef ))| (precedence (<0-7>|
  critical| flash | flashoverride|immediate| internet| network| priority|
  routine))|) (fragments|) (log|) (sample|)
```

Parameters

`<1-268435453>` IPv4 ACL sequence number. `deny` Drop the packet. `permit` Accept the packet. `icmp` Internet Control Message Protocol packet. `A.B.C.D/M` Source IP prefix and length.

`A.B.C.D A.B.C.D`

Source IP address and mask. `host A.B.C.D` A single source host IP address. `any` Match any source IP address.

`A.B.C.D/M` Destination IP prefix and length.

`A.B.C.D A.B.C.D`

Destination IP address and mask. `host A.B.C.D` A single destination host IP address. `any` Match any destination IP address.

`administratively-prohibited`

Administratively prohibited.

`alternate-address`

Alternate address.

`conversion-error`

Datagram conversion.

`dod-host-prohibited`

Host prohibited.

`dod-net-prohibited`

Net prohibited. `echo` Echo (ping). `echo-reply` Echo reply. `general-parameter-problem`

Parameter problem. `host-isolated` Host isolated. `host-precedence-unreachable`

Host unreachable for precedence. `host-redirect` Host redirect.

`host-tos-redirect`

Host redirect for ToS.

`host-tos-unreachable`

Host unreachable for ToS. `host-unknown` Host unknown.

`host-unreachable`

Host unreachable.

`information-reply`

Information replies.

`information-request`

Information requests. `mask-reply` Mask replies. `mask-request` Mask requests.

`mobile-redirect`

Mobile host redirect. `net-redirect` Network redirect.

`net-tos-redirect`

Net redirect for ToS.

`net-tos-unreachable`

Network unreachable for ToS.

`net-unreachable`

Net unreachable.

`network-unknown`

Network unknown.

`no-room-for-option`

Parameter required but no room. `option-missing` Parameter required but not present. `packet-too-big` Fragmentation needed and DF set.

`parameter-problem`

All parameter problems.

`port-unreachable`

Port unreachable.

`precedence-unreachable`

Precedence cutoff.

`protocol-unreachable`

Protocol unreachable.

`reassembly-timeout`

Reassembly timeout. `redirect` All redirects. `router-advertisement`

Router discovery advertisements.

`router-solicitation`

Router discovery solicitations. `source-quench` Source quenches.

`source-route-failed`

Source route failed. `time-exceeded` All time-exceeded messages.

`timestamp-reply`

Time-stamp replies.

`timestamp-request`

Time-stamp requests.

`traceroute`	Traceroute.
`ttl-exceeded`	TTL exceeded.
`unreachable`	All unreachables.
`<0-255>`	ICMP type.
`<0-255>`	ICMP code.
`dscp`	Match packets with given DSCP value.
`<0-63>`	Enter DSCP value between 0-63.
`af11`	AF11 DSCP (001010) decimal value 10.
`af12`	AF12 DSCP (001100) decimal value 12.
`af13`	AF13 DSCP (001110) decimal value 14.

af21	AF21 DSCP (010010) decimal value 18.
af22	AF22 DSCP (010100) decimal value
af23	AF23 DSCP (010110) decimal value 22.
af31	AF31 DSCP (011010) decimal value 26.
af32	AF32 DSCP (011100) decimal value 28.
af33	AF33 DSCP (011110) decimal value 30.
af41	AF41 DSCP (100010) decimal value 34
af42	AF42 DSCP (100100) decimal value 36.
af43	AF43 DSCP (100110) decimal value 38.
cs1	CS1 (precedence 1) DSCP (001000) decimal value 8.
cs2	CS2 (precedence 2) DSCP (010000) decimal value 16.
cs3	CS3 (precedence 3) DSCP (011000) decimal value 24.
cs4	CS4 (precedence 4) DSCP (100000) decimal value 32.
cs5	CS5 (precedence 5) DSCP (101000) decimal value 40.
cs6	CS6 (precedence 6) DSCP (110000) decimal value 48.
cs7	CS7 (precedence 7) DSCP (111000) decimal value 56.
default	Default DSCP (000000) decimal value 0.
ef	EF DSCP (101110) decimal value 46.
precedence	Match packets with given precedence value.
<0-7>	Enter precedence value 0-7.
critical	Match packets with critical precedence (5).
flash	Match packets with flash precedence
flashoverride	(3).
	Match packets with flash override precedence (4).
immediate	Match packets with immediate precedence (2).
internet	Match packets with internetwork control precedence (6).
network	Match packets with network control precedence (7).
priority	Match packets with priority precedence (1).
routine	Match packets with routine precedence (0).

`fragments`	Check non-initial fragments.
`log`	Log the packets matching the filter (in-direction only). (Only supported with deny rules)
`sample`	Sample the packets matching the filter (in-direction only). (Only supported with permit rules)

Default

No default value is specified

Command Mode

IP access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

This command is not supported on Qumran platforms.

Examples

```
#configure terminal
(config)#ip access-list ip-icmp
(config-ip-acl)#200 permit icmp any any
```

ip access-list filter

Use this command to configure access control entry in an access control list (ACL).

This determines whether to accept or drop a packet based on the configured match criteria. Use the no form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|) (deny|permit) (<0-255>|ahp|any|eigrp|esp|gre|ipip|ipcomp|ipv6ip
  |ospf|pim|rsvp|vrrp) (A.B.C.D/ M|A.B.C.D A.B.C.D|host A.B.C.D|any) (A.B.C.D/
  M|A.B.C.D A.B.C.D|host A.B.C.D|any) (dscp (<0-63>|af11| af12| af13| af21| af22|
  af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5|cs6| cs7|
  default| ef )|) (flow-label <0-1048575>|) (fragments|) (log|) (sample|)

no (<1-268435453>|)(deny|permit)(<0-255> |ahp | any | eigrp | esp | gre | ipip |
  ipcomp | ipv6ip | ospf | pim | rsvp| vrrp) (A.B.C.D/ M|A.B.C.D A.B.C.D | host
  A.B.C.D|any) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any) (dscp (<0-63> |af11|
  af12| af13| af21| af22| af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3|
  cs4| cs5|cs6| cs7| default| ef )|) (flow-label <0-1048575>|) (fragments|) (log|)
  (sample|)
```

Parameters

`<1-268435453>`	IPv4 ACL sequence number.
`deny`	Drop the packet.
`permit`	Accept the packet.
`<0-255>`	IANA assigned protocol number.
`any`	Any protocol packet.
`ahp`	Authentication Header packet.
`eigrp`	Enhanced Interior Gateway Routing Protocol packet.
`esp`	Encapsulating Security Payload packet.
`gre`	Generic Routing Encapsulation packet.
`ipip`	IPv4 over IPv4 encapsulation packet.
`ipcomp`	IP Payload Compression Protocol packet.
`ipv6ip`	IPv6 over IPv4 encapsulation packet.
`ospf`	Open Shortest Path First packet.
`pim`	Protocol Independent Multicast packet
`rsvp`	Resource Reservation Protocol packet.
`vrrp`	Virtual Router Redundancy Protocol packet.
`A.B.C.D/M`	Source IP prefix and length.
`A.B.C.D A.B.C.D`	Source IP address and mask.
`host A.B.C.D`	A single source host IP address.

any	Match any source IP address.
A.B.C.D/M	Destination IP prefix and length.

A.B.C.D A.B.C.D

Destination IP address and mask.

host A.B.C.D	A single destination host IP address.
any	Any destination address
any	Match any destination IP address.
log	Log the packets matching the filter (in-direction only).
sample	Sample the packets matching the filter (in-direction only).
dscp	Match packets with given DSCP value.
<0-63>	Enter DSCP value between 0-63.
af11	AF11 DSCP (001010) decimal value 10.
af12	AF12 DSCP (001100) decimal value 12.
af13	AF13 DSCP (001110) decimal value 14.
af21	AF21 DSCP (010010) decimal value 18.
af22	AF22 DSCP (010100) decimal value
af23	AF23 DSCP (010110) decimal value 22.
af31	AF31 DSCP (011010) decimal value 26.
af32	AF32 DSCP (011100) decimal value 28.
af33	AF33 DSCP (011110) decimal value 30.
af41	AF41 DSCP (100010) decimal value 34
af42	AF42 DSCP (100100) decimal value 36.
af43	AF43 DSCP (100110) decimal value 38.
cs1	CS1 (precedence 1) DSCP (001000) decimal value 8.
cs2	CS2 (precedence 2) DSCP (010000) decimal value 16.
cs3	CS3 (precedence 3) DSCP (011000) decimal value 24.
cs4	CS4 (precedence 4) DSCP (100000) decimal value 32.
cs5	CS5 (precedence 5) DSCP (101000) decimal value 40.
cs6	CS6 (precedence 6) DSCP (110000) decimal value 48.
cs7	CS7 (precedence 7) DSCP (111000) decimal value 56.
default	Default DSCP (000000) decimal value 0.
ef	EF DSCP (101110) decimal value 46.
precedence	Match packets with given precedence value.
<0-7>	Enter precedence value 0-7.
critical	Match packets with critical precedence (5).

`flash` Match packets with flash precedence (3).
`flashoverride`

Match packets with flash override precedence (4).

`immediate` Match packets with immediate precedence (2).

`internet`	Match packets with internetwork control precedence (6).
`network`	Match packets with network control precedence (7).
`priority`	Match packets with priority precedence (1).
`routine`	Match packets with routine precedence (0).
`fragments`	Check non-initial fragments.
`log`	Log the packets matching the filter (in-direction only).
`sample`	Sample the packets matching the filter (in-direction only).

Default

No default value is specified

Command Mode

IP access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Log feature is supported only with deny rules. Sample feature is supported only with permit rules. Feature is not supported on Qumran platforms.

Examples

```
#configure terminal
(config)#ip access-list ip-acl-01
(config-ip-acl)#11 permit any 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255
(config-ip-acl)#no 11
```

ip access-list fragments

Use this command to configure access list to deny or permit all the IP fragmented.

Use the `no` form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

`(<1-268435453>|) fragments (deny-all|permit-all) (log|) (sample|) no (<1-268435453>|) fragments (deny-all|permit-all) (log|) (sample|)` **Parameters**

`deny-all`	Drop the packet.
`permit-all`	Accept the packet.
`<1-268435453>`	IPv4 ACL sequence number.

`fragments`	Check non-initial.
`log`	Log the packets matching the filter (in-direction only.
`Sample`	Sample the packets matching the filter (in-direction only.

Default

No default value is specified

Command Mode

IP access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Log feature is supported only with deny rules. Sample feature is supported only with permit rules. Feature is not supported on Qumran platforms.

Examples

```
#configure terminal
(config)#ip access-list mylist
(config-ip-acl)#fragments deny-all
(config-ip-acl)#end
```

ip access-list remark

Use this command to add a description to a named IPv4 access control list (ACL).

Use the `no` form of this command to remove an ACL description.

Command Syntax `remark LINE no remark`

Parameters

`LINE`	ACL description up to 100 characters.

Default

No default value is specified

Command Mode

IP access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip access-list mylist (config-ip-acl)#remark
permit the inside admin address (config-ip-acl)#exit

(config)#ip access-list mylist
```

```
(config-ip-acl)#no remark
(config-ip-acl)#exit
```

ip access-list resequence

Use this command to re-sequence the IP access list.

Note: Use a non-overlapping sequence space for new sequence number sets to avoid possible unexpected rule matches during transition.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

Command Syntax `resequence <1-268435453> INCREMENT`

Parameters

`<1-268435453>` Starting sequence number.

`INCREMENT` Sequence number increment steps.

Default

None

Command Mode

IP access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip access-list mylist (config-ip-acl)#resequence 5 5
(config-ip-acl)#end
```

ip access-list tcp|udp

Use this command to define a named access control list (ACL) that determines whether to accept or drop an incoming packet based on the criteria that you specify.

This form of this command filters packets based on source and destination IP address along with protocol (TCP or UDP) and port.

This command has these main parts:

- The source that you can specify as a prefix and length, an address and mask, a host address, or `any`. Optionally, you can specify a port.
- The destination that you specify the same as the source.

An ACL is made up of one or more ACL specifications. You can repeat this command and add multiple specifications. Each time you give this command, the specification is added to the end of the list.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the

packet is denied. For this reason, place the most frequently occurring specifications at the top of the list. The device stops checking the specifications after a match occurs.

There is an implied `deny` specification for traffic that is not permitted. A single-entry ACL with only one `deny` specification is the same as denying all traffic. You must have at least one `permit` specification in an ACL or all traffic is blocked.

Use the `no` form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|) (deny|permit) tcp (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
 ((eq|gt|lt|neq) (<0-65535>|bgp|chargen|cmd|daytime|discard|domain|drip|echo

```

Parameters

`<1-268435453>` IPv4 ACL sequence number.

`deny` Drop the packet. `permit` Accept the packet.

`tcp` Transmission Control Protocol. `udp` User Datagram Protocol.

`A.B.C.D/M` Source or destination IP prefix and length.

`A.B.C.D A.B.C.D` Source or destination IP address and mask.

`host A.B.C.D` Source or destination host IP address.

`any` Any source or destination IP address.

`eq` Source or destination port equal to.

`gt` Source or destination port greater than.

`lt` Source or destination port less than.

`neq` Source or destination port not equal to.

`<0-65535>` Source or destination port number.

`range` Range of source or destination port numbers:

`<0-65535>` Lowest value in the range. `<0-65535>` Highest value in the range. `bgp` Border Gateway Protocol. `chargen` Character generator. `cmd` Remote commands. `daytime` Daytime. `discard` Discard. `domain` Domain Name Service. `drip` Dynamic Routing Information Protocol.

`echo` Echo.

`exec` EXEC.

finger	Finger.
ftp	File Transfer Protocol.
ftp-data	FTP data connections.
gopher	Gopher.
hostname	NIC hostname server.
ident	Ident Protocol.
irc	Internet Relay Chat.
klogin	Kerberos login.
kshell	Kerberos shell.
login	Login.
lpd	Printer service.
nntp	Network News Transport Protocol.
pim-auto-rp	PIM Auto-RP.
pop2	Post Office Protocol v2.
pop3	Post Office Protocol v3.
smtp	Simple Mail Transport Protocol.
ssh	Secure Shell.
sunrpc	Sun Remote Procedure Call.
tacacs	TAC Access Control System.
talk	Talk.
telnet	Telnet.
time	Time.
uucp	UNIX-to-UNIX Copy Program.
whois	WHOIS/NICNAME
www	World Wide Web.
nntp	Range of source or destination port numbers:
dscp	Match packets with given DSCP value.
<0-63>	Enter DSCP value between 0-63.
af11	AF11 DSCP (001010) decimal value 10.
af12	AF12 DSCP (001100) decimal value 12.
af13	AF13 DSCP (001110) decimal value 14.
af21	AF21 DSCP (010010) decimal value 18.
af22	AF22 DSCP (010100) decimal value
af23	AF23 DSCP (010110) decimal value 22.
af31	AF31 DSCP (011010) decimal value 26.
af32	AF32 DSCP (011100) decimal value 28.
af33	AF33 DSCP (011110) decimal value 30.
af41	AF41 DSCP (100010) decimal value 34

af42	AF42 DSCP (100100) decimal value 36.
af43	AF43 DSCP (100110) decimal value 38.
cs1	CS1 (precedence 1) DSCP (001000) decimal value 8.
cs2	CS2 (precedence 2) DSCP (010000) decimal value 16.
cs3	CS3 (precedence 3) DSCP (011000) decimal value 24.
cs4	CS4 (precedence 4) DSCP (100000) decimal value 32.
cs5	CS5 (precedence 5) DSCP (101000) decimal value 40.
cs6	CS6 (precedence 6) DSCP (110000) decimal value 48.
cs7	CS7 (precedence 7) DSCP (111000) decimal value 56.
default	Default DSCP (000000) decimal value 0.
ef	EF DSCP (101110) decimal value 46.
precedence	Match packets with given precedence value.
<0-7>	Enter precedence value 0-7.
critical	Match packets with critical precedence (5).
flash	Match packets with flash precedence (3).
flashoverride	Match packets with flash override precedence (4).
immediate	Match packets with immediate precedence (2).
internet	Match packets with internetwork control precedence (6).
network	Match packets with network control precedence (7).
priority	Match packets with priority precedence (1).
routine	Match packets with routine precedence (0).
ack	Match on the Acknowledgment (ack) bit.
established	Matches only packets that belong to an established TCP connection.
fin	Match on the Finish (fin) bit.
psh	Match on the Push (psh) bit.
rst	Match on the Reset (rst) bit.
syn	Match on the Synchronize (syn) bit.
urg	Match on the Urgent (urg) bit.
biff	Biff.
bootpc	Bootstrap Protocol (BOOTP) client.
bootps	Bootstrap Protocol (BOOTP) server.
discard	Discard.
dnsix	DNSIX security protocol auditing.
domain	Domain Name Service.
echo	Echo.
isakmp	Internet Security Association and Key Management Protocol.

mobile-ip	Mobile IP registration.
nameserver	IEN116 name service.
netbios-dgm	Net BIOS datagram service.
netbios-ns	Net BIOS name service.
netbios-ss	Net BIOS session service.
non500-isakmp	Non500-Internet Security Association and Key Management Protocol.
ntp	Network Time Protocol.
pim-auto-rp	PIM Auto-RP.
rip	Routing Information Protocol.
snmp	Simple Network Management Protocol.
snmptrap	SNMP Traps.
sunrpc	Sun Remote Procedure Call.
syslog	System Logger.
tacacs	TAC Access Control System.
talk	Talk.
tftp	Trivial File Transfer Protocol.
time	Time.
who	Who service.
xdmcp	X Display Manager Control Protocol.
Log	Log the packets matching the filter (in-direction only.
Sample	Sample the packets matching the filter (in-direction only.

Default

No default value is specified

Command Mode

IP access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Log feature is supported only with deny rules. Sample feature is supported only with permit rules. Feature is not supported on Qumran platforms.

Examples

```
#configure terminal
(config)#ip access-list ip-acl-02
(config-ip-acl)#deny udp any any eq tftp
(config-ip-acl)#deny tcp any any eq ssh
(config-ip-acl)#end
```

ip access-list WORD

Use this command to define a named access control list (ACL) that determines whether to accept or drop an incoming packet based on the source IP address, either an exact match or a range of prefixes.

An ACL is made up of one or more ACL specifications. You can repeat this command and add multiple specifications. Each time you give this command, the specification is added to the end of the list.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied `deny` specification for traffic that is not permitted. A single-entry ACL with only one `deny` specification is the same as denying all traffic. You must have at least one `permit` specification in an ACL or all traffic is blocked.

Use the `no` form of this command to remove an ACL specification.

Command Syntax `ip access-list WORD no ip access-list WORD`

Parameters

`WORD`	Access-list name.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ip-acl-01
```

ipv6 access-list default

Use this command to modify the default rule action of access-list. Default rule is applicable only when access-list is attached to interface. Default rule will have the lowest priority and only the packets not matching any of the user defined rules match default rule.

Command Syntax `default (deny-all|permit-all) (log|) (sample|)`

Parameters

`deny-all`	Drop all packets.

permit-all	Accept all packets.
log	Log the packets matching the filter (in-direction only).
Sample	Sample the packets matching the filter (in-direction only).

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Log feature is supported only with deny rules. Sample feature is supported only with permit rules. Feature is not supported on Qumran platforms.

Examples

```
#configure terminal
(config)#ip access-list ipv6-acl-01
(config-ipv6-acl)#default permit-all sample
```

ipv6 access-list filter

Use this command to define an access-control entry in an access control list (ACL) that determines whether to accept or drop a packet based on the criteria specified. This form of this command filters packets based on:

- Protocol
- Source IP address
- Destination IP address

Use the no form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|) (deny|permit)(<0-255>|ahp|any|eigrp|esp|gre|ipipv6|ipcomp
  |ipv6ipv6|ospf|pim|rsvp|vrrp) (X:X::X:X/ M|X:X::X:X X:X::X:X|host X:X::X:X|any)
  (X:X::X:X/M|X:X::X:X X:X::X:X|host X:X::X:X|any) (dscp (<0-63>|af11| af12| af13|
  af21| af22| af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5|cs6|
  cs7| default| ef )|) (flow-label<0-1048575>|) (fragments|) (log|) (sample|)

no (<1-268435453>|)(deny|permit)(<0-255>|ahp|any|eigrp|esp|gre|ipipv6|ipcomp
  |ipv6ipv6|ospf|pim|rsvp|vrrp) (X:X::X:X/ M|X:X::X:X X:X::X:X|host X:X::X:X|any)
  (X:X::X:X/M|X:X::X:X X:X::X:X|host X:X::X:X|any) (dscp (<0-63>|af11| af12| af13|
  af21| af22| af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5|cs6|
  cs7| default| ef )|) (flow-label<0-1048575>|) (fragments|) (log|) (sample|)
```

Parameters

<1-268435453>	IPv4 ACL sequence number.
deny	Drop the packet.

permit Accept the packet.
<0-255> IANA assigned protocol number.
any Any protocol packet.
ahp Authentication Header packet.
eigrp Enhanced Interior Gateway Routing Protocol packet.
esp Encapsulating Security Payload packet.
gre Generic Routing Encapsulation packet.
ipipv6 IPv4 over IPv6 Encapsulation packet.
ipcomp IP Payload Compression Protocol packet.
ipv6ipv6 IPv6 over IPv6 Encapsulation packet.
ospf Open Shortest Path First packet.
pim Protocol Independent Multicast packet
rsvp Resource Reservation Protocol packet. v
rrp Virtual Router Redundancy Protocol packet.
X:X::X:X/M Source Address with network mask length.
X:X::X:X X:X::X:X
Source Address with wild card mask.
host X:X::X:X Source Address's wild card mask (ignored bits). any Any source address.
X:X::X:X/M Destination address with network mask length.
X:X::X:X X:X::X:X
Destination address with wild card mask.
host X:X::X:X Destination address's wild card mask (ignored bits).
any Any destination address any Match any destination IP address. log Log the packets matching the filter (in-direction only). sample Sample the packets matching the filter (in-direction only).
dscp Match packets with given DSCP value.
<0-63> Enter DSCP value between 0-63. af11 AF11 DSCP (001010) decimal value 10. af12 AF12 DSCP (001100) decimal value 12. af13 AF13 DSCP (001110) decimal value 14. af21 AF21 DSCP (010010) decimal value 18. af22 AF22 DSCP (010100) decimal value af23 AF23 DSCP (010110) decimal value 22. af31 AF31 DSCP (011010) decimal value 26. af32 AF32 DSCP (011100) decimal value 28. af33 AF33 DSCP (011110) decimal value 30. af41 AF41 DSCP (100010) decimal value 34 af42 AF42 DSCP (100100) decimal value 36. af43 AF43 DSCP (100110) decimal value 38. cs1 CS1 (precedence 1) DSCP (001000) decimal value 8. cs2 CS2 (precedence 2) DSCP (010000) decimal value 16. cs3 CS3 (precedence 3) DSCP (011000) decimal value 24. cs4 CS4 (precedence 4) DSCP (100000) decimal value 32. cs5 CS5 (precedence 5) DSCP (101000) decimal value 40. cs6 CS6 (precedence 6) DSCP (110000) decimal value 48. cs7 CS7 (precedence 7) DSCP (111000) decimal value 56. default Default DSCP (000000) decimal value 0. ef EF DSCP (101110) decimal value 46.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Log feature is supported only with deny rules. Sample feature is supported only with permit rules. Feature is not supported on Qumran platforms.

Examples

```
#configure terminal
(config)#ipv6 access-list ipv6-acl-01
(config-ip-acl)#permit ipipv6 any any
(config-ip-acl)#end
```

ipv6 access-list fragments

Use this command to permit or deny all the IPv6 fragments.

Use the no form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
    (<1-268435453>|) fragments (deny-all|permit-all) (log|) (sample|) no (<1-
268435453>|) fragments (deny-all|permit-all) (log|) (sample|)
```

Parameters

`<1-268435453>`	IPv6 ACL sequence number.
`fragments`	Check non-initial fragments.
`deny-all`	Specify packets to reject.
`permit-all`	Specify packets to forward.
`log`	Log the packets matching the filter (in-direction only).
`sample`	Sample the packets matching the filter (in-direction only).

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Log feature is supported only with deny rules. Sample feature is supported only with permit rules. Feature is not supported on Qumran platforms.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#fragments deny-all
```

ipv6 access-group

Use this command to attach an IPv6 access list to an interface to filter incoming or outgoing packets.

When you attach an access list to a VLAN interface or LAG interface as well as to a physical interface that is a member of that LAG and/or VLAN interface, the priority order is:

1. VLAN interface
2. LAG interface
3. Physical interface

For example, if you attach access lists to both a LAG interface and a physical interface that is a member of that LAG, matching traffic rules are applied to the LAG interface, but not to the physical interface.

Use the `no` parameter with this command to detach an IPv6 access list.

Command Syntax `ipv6 access-group WORD (in|out) no ipv6 access-group WORD (in|out)`

Parameters

`WORD`	Access list name.
`in`	Filter incoming packets.
`out`	Filter outgoing packets (not supported on Qumran platform).

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#permit ipv6 any any
(config-ipv6-acl)#exit

(config)#interface eth3
(config-if)#ipv6 access-group mylist in

(config)#interface eth3
(config-if)#no ipv6 access-group mylist in
```

ipv6 access-list icmpv6

Use this command to permit or deny packets with the given source and destination IPv6 address, DSCP value, fragments and flow label.

Use the no form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|)(deny|permit) (icmpv6) (X:X::X:X/M|X:X::X:X X:X::X:X|any)
  (X:X::X:X/ M|X:X::X:X X:X::X:X|any) (beyond-scope| destination-unreachable| echo-
  reply| echo-request| header| hop-limit| mld-query| mld-reduction| mld-report| nd-

flow-label	IPv6 Flow-label.
<0-1048575>	IPv6 Flow-label value.
fragments	Check non-initial fragments.
log	Log the packets matching the filter (in-direction only).
sample	Sample the packets matching the filter (in-direction only).

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Log feature is supported only with deny rules. Sample feature is supported only with permit rules. Feature is not supported on Qumran platforms.

Examples

```
    #configure terminal
    (config)#ipv6 access-list mylist
(config-ipv6-acl)#200 permit icmpv6 any any fragments
```

ipv6 access-list remark

Use this command to add a description to an IPv6 access control list (ACL). Use the `no` form of this command to remove an access control list description.

Command Syntax `remark LINE no remark`

Parameters

`LINE`	ACL description up to 100 characters.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)# remark Permit the inside admin address
```

ipv6 access-list resequence

Use this command to re-sequence the IPv6 access list.

Note: Use a non-overlapping sequence space for new sequence number sets to avoid possible unexpected rule matches during transition.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

Command Syntax `resequence <1-268435453> INCREMENT`

Parameters

`<1-268435453>`	Starting Sequence number.
`INCREMENT`	Sequence number increment steps.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#resequence 15 15
```

ipv6 access-list sctp

Use this command to allow ACL to permit or deny SCTP packets based on the given source and destination IPV6 address. Even DSCP, flow label and fragment can be configured to permit or deny with the given values.

Use the `no` form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|) (deny|permit) (sctp) (X:X::X:X/M|X:X::X:X X:X::X:X|any) (X:X::X:X/
  M|X:X::X:X X:X::X:X|any) {(eq|gt|lt|neq) (<0-65535>) | (range <0-65535> <065535>)|
  (fragments)| } (dscp (<0-63>| af11| af12| af13| af21| af22| af23| af31| af32|
  af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5| cs6| cs7| default| ef)|)
  ((flow-label   <0-1048575>)|)   (log|)   (sample|)   no   (<1-268435453>|)

(deny|permit) (sctp) (X:X::X:X/M|X:X::X:X X:X::X:X|any)

  (X:X::X:X/M|X:X::X:X X:X::X:X|any) {(eq|gt|lt|neq) (<0-65535>) | (range <0-65535>
  <0-65535>)| (fragments)| } (dscp (<0-63>| af11| af12| af13| af21| af22| af23|
  af31| af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5| cs6| cs7| default|
  ef)|) ((flow-label <0-1048575>)|) (log|) (sample|)
```

Parameters

`<1-268435453>`	IPv6 ACL sequence number.
`deny`	Drop the packet.
`permit`	Accept the packet.
`sctp`	Stream Control Transmission Protocol packet.
`X:X::X:X/M`	Source address with network mask length.
`X:X::X:X`	Source address with wild card mask.
`X:X::X:X`	Source address's wild card mask (ignored bits).
`any`	Any source address.
`X:X::X:X/M`	Destination address with network mask length.
`X:X::X:X`	Destination address with wild card mask.
`X:X::X:X`	Destination address's wild card mask (ignored bits).
`any`	Any destination address.
`eq`	Source or destination port equal to.
`gt`	Source or destination port greater than.

lt	Source or destination port less than.
neq	Source or destination port not equal to.
<0-65535>	Source or destination port number.
range	Range of source or destination port numbers:
<0-65535>	Lowest value in the range.
<0-65535>	Highest value in the range.
dscp	Match packets with given DSCP value.
<0-63>	Enter DSCP value between 0-63.
af11	AF11 DSCP (001010) decimal value 10.
af12	AF12 DSCP (001100) decimal value 12.
af13	AF13 DSCP (001110) decimal value 14.
af21	AF21 DSCP (010010) decimal value 18.
af22	AF22 DSCP (010100) decimal value
af23	AF23 DSCP (010110) decimal value 22.
af31	AF31 DSCP (011010) decimal value 26.
af32	AF32 DSCP (011100) decimal value 28.
af33	AF33 DSCP (011110) decimal value 30.
af41	AF41 DSCP (100010) decimal value 34
af42	AF42 DSCP (100100) decimal value 36.
af43	AF43 DSCP (100110) decimal value 38.
cs1	CS1 (precedence 1) DSCP (001000) decimal value 8.
cs2	CS2 (precedence 2) DSCP (010000) decimal value 16.
cs3	CS3 (precedence 3) DSCP (011000) decimal value 24.
cs4	CS4 (precedence 4) DSCP (100000) decimal value 32.
cs5	CS5 (precedence 5) DSCP (101000) decimal value 40.
cs6	CS6 (precedence 6) DSCP (110000) decimal value 48.
cs7	CS7 (precedence 7) DSCP (111000) decimal value 56.
default	Default DSCP (000000) decimal value 0.
ef	EF DSCP (101110) decimal value 46.
flow-label	IPv6 Flow-label.
<0-1048575>	IPv6 Flow-label value.
fragments	Check non-initial fragments.
log	Log the packets matching the filter (in-direction only).
sample	Sample the packets matching the filter (in-direction only).

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Log feature is supported only with deny rules. Sample feature is supported only with permit rules. Feature is not supported on Qumran platforms.

Examples

```
    #configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#200 permit sctp any any fragments
```

ipv6 access-list tcp|udp

Use this command to define a named access control list (ACL) that determines whether to accept or drop an incoming packet based on the criteria that you specify. This form of this command filters packets based on source and destination IP address along with protocol (TCP or UDP) and port.

This command has these main parts:

- The source which you can specify as a prefix and length, an address and mask, a host address, or `any`. Optionally, you can specify a port.
- The destination which you specify the same as the source.

An ACL is made up of one or more ACL specifications. You can repeat this command and add multiple specifications. Each time you give this command, the specification is added to the end of the list.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied `deny` specification for traffic that is not permitted. A single-entry ACL with only one `deny` specification is the same as denying all traffic. You must have at least one `permit` specification in an ACL or all traffic is blocked.

Use the `no` form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|) (deny|permit) tcp (X:X::X:X/M|X:X::X:X X:X::X:X|any)
  ((eq|gt|lt|neq) <0-65535> |bgp|chargen|cmd|daytime|discard|domain|drip
  |echo|exec|finger|ftp |ftp- data|gopher|hostname|ident|irc|klogin|kshell

({ack|established|fin|psh|rst|syn|urg}|) (log|) (sample|)

Parameters

<1-268435453> IPv6 ACL sequence number.

deny Drop the packet. permit Accept the packet.

tcp Transmission Control Protocol. udp User Datagram Protocol.

X:X::X:X/M Source or destination IPv6 prefix and length.

X:X::X:X X:X::X:X Source or destination IPv6 address and mask. host X:X::X:X A single source or destination host IPv6 address. any Any source or destination IPv6 address. eq Source or destination port equal to. gt Source or destination port greater than.

`lt` Source or destination port less than. `neq` Source or destination port not equal to.

`<0-65535>`	Source or destination port number.
`range`	Range of source or destination port numbers:
`<0-65535>`	Lowest value in the range.
`<0-65535>`	Highest value in the range.
`ftp`	File Transfer Protocol (21).
`ssh`	Secure Shell (22).
`telnet`	Telnet (23).
`www`	World Wide Web (HTTP 80).
`tftp`	Trivial File Transfer Protocol (69).
`bootp`	Bootstrap Protocol (BOOTP) client (67).
`bgp`	Border Gateway Protocol.
`chargen`	Character generator.
`cmd`	Remote commands.
`daytime`	Daytime.
`discard`	Discard.
`domain`	Domain Name Service.
`drip`	Dynamic Routing Information Protocol.
`echo`	Echo.
`exec`	EXEC.
`finger`	Finger.
`ftp`	File Transfer Protocol.
`ftp-data`	FTP data connections.
`gopher`	Gopher.
`hostname`	NIC hostname server.
`ident`	Ident Protocol.
`irc`	Internet Relay Chat.
`klogin`	Kerberos login.
`kshell`	Kerberos shell.
`login`	Login.
`lpd`	Printer service.
`nnt`	Network News Transport Protocol.
`pim-auto-rp`	PIM Auto-RP.
`pop2`	Post Office Protocol v2.
`pop3`	Post Office Protocol v3.
`smtp`	Simple Mail Transport Protocol.

ssh	Secure Shell.
sunrpc	Sun Remote Procedure Call.
tacacs	TAC Access Control System.
talk	Talk.
telnet	Telnet.
time	Time.
uucp	UNIX-to-UNIX Copy Program.
whois	WHOIS/NICNAME
www	World Wide Web.
nntp	Range of source or destination port numbers:
dscp	Match packets with given DSCP value.
<0-63>	Enter DSCP value between 0-63.
af11	AF11 DSCP (001010) decimal value 10.
af12	AF12 DSCP (001100) decimal value 12.
af13	AF13 DSCP (001110) decimal value 14.
af21	AF21 DSCP (010010) decimal value 18.
af22	AF22 DSCP (010100) decimal value
af23	AF23 DSCP (010110) decimal value 22.
af31	AF31 DSCP (011010) decimal value 26.
af32	AF32 DSCP (011100) decimal value 28.
af33	AF33 DSCP (011110) decimal value 30.
af41	AF41 DSCP (100010) decimal value 34
af42	AF42 DSCP (100100) decimal value 36.
af43	AF43 DSCP (100110) decimal value 38.
cs1	CS1 (precedence 1) DSCP (001000) decimal value 8.
cs2	CS2 (precedence 2) DSCP (010000) decimal value 16.
cs3	CS3 (precedence 3) DSCP (011000) decimal value 24.
cs4	CS4 (precedence 4) DSCP (100000) decimal value 32.
cs5	CS5 (precedence 5) DSCP (101000) decimal value 40.
cs6	CS6 (precedence 6) DSCP (110000) decimal value 48.
cs7	CS7 (precedence 7) DSCP (111000) decimal value 56.
default	Default DSCP (000000) decimal value 0.
ef	EF DSCP (101110) decimal value 46.
precedence	Match packets with given precedence value.
<0-7>	Enter precedence value 0-7.

`critical`	Match packets with critical precedence (5).
`flash`	Match packets with flash precedence (3).
`flashoverride`	Match packets with flash override precedence (4).
`immediate`	Match packets with immediate precedence (2).
`internet`	Match packets with internetwork control precedence (6).
`network`	Match packets with network control precedence (7).
`priority`	Match packets with priority precedence (1).
`routine`	Match packets with routine precedence (0).

`ack`	Match on the Acknowledgment (ack) bit.
`established`	Matches only packets that belong to an established TCP connection.
`fin`	Match on the Finish (fin) bit.
`psh`	Match on the Push (psh) bit.
`rst`	Match on the Reset (rst) bit.
`syn`	Match on the Synchronize (syn) bit.
`urg`	Match on the Urgent (urg) bit.
`biff`	Biff.
`bootpc`	Bootstrap Protocol (BOOTP) client.
`bootps`	Bootstrap Protocol (BOOTP) server.
`discard`	Discard.
`dnsix`	DNSIX security protocol auditing.
`domain`	Domain Name Service.
`echo`	Echo.
`isakmp`	Internet Security Association and Key Management Protocol.
`mobile-ip`	Mobile IP registration.
`nameserver`	IEN116 name service.
`netbios-dgm`	Net BIOS datagram service.
`netbios-ns`	Net BIOS name service.
`netbios-ss`	Net BIOS session service.
`non500-isakmp`	Non500-Internet Security Association and Key Management Protocol.
`ntp`	Network Time Protocol.
`pim-auto-rp`	PIM Auto-RP.
`rip`	Routing Information Protocol.
`snmp`	Simple Network Management Protocol.
`snmptrap`	SNMP Traps.
`sunrpc`	Sun Remote Procedure Call.

`syslog`	System Logger.
`tacacs`	TAC Access Control System.
`talk`	Talk.
`tftp`	Trivial File Transfer Protocol.
`time`	Time.
`who`	Who service.
`xdmcp`	X Display Manager Control Protocol.
`log`	Log the packets matching the filter (in-direction only).
`sample`	Sample the packets matching the filter (in-direction only).

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#deny udp any eq tftp
(config-ipv6-acl)#deny tcp fd22:bf66:78a4:10a2::/64 fdf2:860a:746a:e49c::/64
eq ssh
```

ipv6 access-list WORD

Use this command to define a named access control list (ACL) that determines whether to accept or drop an incoming packet based on the criteria that you specify. This form of this command filters packets based on:

- Protocol
- Source IP address
- Destination IP address.

An ACL is made up of one or more ACL specifications. You can repeat this command and add multiple specifications. Each time you give this command, the specification is added to the end of the list.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied `deny` specification for traffic that is not permitted. A single-entry ACL with only one `deny` specification is the same as denying all traffic. You must have at least one `permit` specification in an ACL or all traffic is blocked.

Use the `no` form of this command to remove an ACL specification.

Command Syntax `ipv6 access-list WORD`

`no ipv6 access-list WORD`

Parameters

`WORD`	Access-list name.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list ipv6-acl-01
(config-ipv6-acl)#exit
```

mac access-group

Use this command to attach a MAC access list to an interface to filter incoming packets.

When you attach an access list to a VLAN interface or LAG interface as well as to a physical interface that is a member of that LAG and/or VLAN interface, the priority order is:

1. VLAN interface
2. LAG interface
3. Physical interface

For example, if you attach access lists to both a LAG interface and a physical interface that is a member of that LAG, matching traffic rules are applied to the LAG interface, but not to the physical interface.

Use the no parameter with this command to detach a MAC access group.

Note: Access-group on egress direction uses the TCAM group used by QoS output service policy. Hence, actions will be unpredictable when conflicting matches are configured on same interface. It is recommended to avoid such configuration. Otherwise user need to configure priority (in QoS) / sequence number (in ACL) carefully to tackle such cases.

Command Syntax `mac access-group`

`WORD in no mac access-group`

`WORD in`

Parameters

`WORD`	Access list name.
`in`	Filter incoming packets.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mylist (config-mac-
acl)#permit any any
(config-mac-acl)#exit

(config)#interface eth3
(config-if)#mac access-group mylist in
(config-if)#exit

(config)#interface eth3
(config-if)#no mac access-group mylist in
(config-if)#exit
```

mac access-list default

Use this command to modify the default rule action of access-list. Default rule is applicable only when access-list is attached to interface. Default rule will have the lowest priority and only the packets not matching any of the user defined rules match default rule.

Command Syntax `default (deny-all|permit-all) (log|) (sample|)`

Parameters

`deny-all`	Drop all packets.
`permit-all`	Accept all packets.
`log`	Log the packets matching the filter (in-direction only).
`Sample`	Sample the packets matching the filter (in-direction only).

Default

No default value is specified

Command Mode

MAC access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Log feature is supported only with deny rules. Sample feature is supported only with permit rules. Feature is not supported on Qumran platforms.

Examples

```
#configure terminal
(config)#mac access-list mac-acl-01
(config-mac-acl)#default permit-all sample
```

mac access-list filter

Use this command to define an access control entry (ACE) in a named access control list (ACL) that determines whether to permit or deny Layer2 packets with the given source and destination MAC, ether type, cos and VLAN values.

Use the no form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|)(deny|permit) (any | (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) (any | (XX-XX-XX-XX-
  XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) (aarp|appletalk|decnet-
  iv|diagnostic|etype-6000|etype-8042 |ip4|ip6|mpls|lat|lavc-sca|mop-console|mop-
  dump|vines-echo|WORD|) (cos <0-7>|)(vlan <1-4094>|) (log|) (sample|)

no (<1-268435453>|)(deny|permit) (any | (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) (any | (XX-XX-XX-XX-
  XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) (aarp|appletalk|decnet-
  iv|diagnostic|etype-6000|etype-8042 |ip4|ip6|mpls|lat|lavc-sca|mop-console|mop-
  dump|vines-echo|WORD|) (cos <0-7>|)(vlan <1-4094>|) (log|) (sample|)
```

Parameters

`deny` Drop the packet. `permit`

Accept the packet.

`<1-268435453>` IPv4 ACL sequence number.

`any` Source/Destination any.

`XX-XX-XX-XX-XX-XX`

Source/Destination MAC address (Option 1).

`XX:XX:XX:XX:XX:XX`

Source/Destination MAC address (Option 2).

`XXXX.XXXX.XXXX`

Source/Destination MAC address (Option 3).

`XX-XX-XX-XX-XX-XX`

Source/Destination wildcard (Option1).

`XX:XX:XX:XX:XX:XX`

Source/Destination wildcard (Option2).

XXXX.XXXX.XXXX	Source/Destination wildcard (Option3).
host	A single source/destination host.
aarp	Ethertype - 0x80f3.
appletalk	Ethertype - 0x809b.
decnet-iv	Ethertype - 0x6003.
diagnostic	Ethertype - 0x6005.
etype-6000	Ethertype - 0x6000.
etype-8042	Ethertype - 0x8042.
ip4	Ethertype - 0x0800.
ip6	Ethertype - 0x86dd.
mpls	Ethertype - 0x8847.
lat	Ethertype - 0x6004.
lavc-sca	Ethertype - 0x6007.
mop-console	Ethertype - 0x6002.
mop-dump	Ethertype - 0x6001.
vines-echo	Ethertype - 0x0baf.
WORD	Any Ethertype value.
cos <0-7>	Cos value.
vlan <1-4094>	VLAN value.
log	Log the packets matching the filter (in-direction only).
sample	Sample the packets matching the filter (in-direction only).

Default

No default value is specified

Command Mode

MAC access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Log feature is supported only with deny rules. Sample feature is supported only with permit rules. Feature is not supported on Qumran platforms.

Examples

```
#configure terminal
(config)#mac access-list mac-acl-01 (config-mac-acl)#permit
0000.1234.1234 0000.0000.0000 any sample
```

mac access-list remark

Use this command to add a description to an MAC access control list (ACL).

Use the `no` form of this command to remove an ACL description.

Command Syntax `remark LINE no remark`

Parameters

LINE	ACL description up to 100 characters.

Default

No default value is specified

Command Mode

MAC access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mylist
                    (config-mac-acl)# remark Permit the inside admin address
```

mac access-list resequence

Use this command to re-sequence the mac access list.

Note: Use a non-overlapping sequence space for new sequence number sets to avoid possible unexpected rule matches during transition.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

Command Syntax `resequence <1-268435453>`

`INCREMENT`

Parameters

`<1-268435453>` Starting sequence number.

`INCREMENT` Sequence number increment steps.

Default

No default value is specified

Command Mode

MAC access-list mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mylist
(config-mac-acl)#resequence 15 15
```

mac access-list WORD

Use this command to define a named access control list (ACL) that determines whether to permit or deny packets with the given source and destination MAC, ether type, cos or VLAN values.

An ACL is made up of one or more ACL specifications. You can repeat this command and add multiple specifications. Each time you give this command, the specification is added to the end of the list.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied `deny` specification for traffic that is not permitted. A single-entry ACL with only one `deny` specification is the same as denying all traffic. You must have at least one `permit` specification in an ACL or all traffic is blocked.

Use the `no` form of this command to remove an ACL specification.

Command Syntax `mac access-list WORD no mac access-list WORD`

Parameters

`WORD`	Access-list name.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mac-acl-01
(config-mac-acl)#exit
```

show access-lists

Use this command to display a list of access list

Command Syntax `show access-lists (WORD|) (expanded|summary|)`

Parameters

`WORD`	Access-list name.
`expanded`	Expanded access-list.
`summary`	Summary of access-list.

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show access-lists expanded
IP access list Iprule1
11 permit ip 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255
```

```
default deny-all MAC access list Macrule1 10 permit host
0000.1234.1234 any default deny-all IPv6 access list ipv6-
acl-01 10 deny ahp 3ffe::/64 4ffe::/64 default deny-all

© Symanitron Proprietary

show access-list log-cache

Use this command to show the ACL logging table entries

Command Syntax `show access-lists log-cache`

Parameters

None

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show access-lists log-cache
2016 Oct 26 12:08:37:xe1/1: 0000.0100.0a00 -> 0000.0100.0b00, ethertype IP
(0x800), proto tcp, vlan 2, 0.0.0.0:0 -> 0.0.0.0:0 ...suppressed 11 times

  2016 Oct 26 12:07:51:xe1/1: 0000.0100.0a00 -> 0000.0100.0b00, ethertype IP
(0x800), proto 255, vlan 2, 0.0.0.0 -> 0.0.0.0 ...suppressed 10 times
```

show ip access-lists

Use this command to display IP access list

Command Syntax `show ip access-lists (WORD|) (expanded|summary|)`

Parameters

`WORD`	Access-list name.
`expanded`	Expanded access-list.
`summary`	Summary of access-list.

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ip access-lists
IP access list Iprule2
11 permit ip 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255 12 deny ip 30.0.0.2
0.0.0.255 182.124.0.3/24 default deny-all

#show ip access-lists summary IPV4 ACL Iprule3
statistics enabled Total ACEs Configured: 4
Configured on interfaces: sa1 - ingress (Port ACL)

interfaces: sa1 - ingress (Port ACL) xe1/1 - ingress
(Port ACL) xe1/2 - ingress (Router ACL) xe1/3 -
ingress (Router ACL)
```

show ipv6 access-lists

Use this command to display IPv6 access lists.

Command Syntax `show ipv6 access-lists (WORD|) (expanded|summary|)`

Parameters

`WORD`	Access-list name.
`expanded`	Expanded access-list.
`summary`	Summary of access-list.

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ipv6 access-lists
IPv6 access list ipv6-acl-01
10 deny ahp 3ffe::/64 4ffe::/64
20 permit ahp 78fe::1/48 68fe::1/48
30 permit ahp 3333::1/64 4444::1/48 fragments 40 permit ahp 5555::1/64
4444::1/48 dscp af23 default deny-all
```

```
#show ipv6 access-lists summary IPV6 ACL ipv6-acl-01
statistics enabled Total ACEs Configured: 4 Configured
on interfaces: sa3 - ingress (Router ACL) vlan1.3 -
ingress (Router ACL) xe1/1 - ingress (Port ACL) xe1/2 -
ingress (Router ACL) xe1/3 - ingress (Router ACL) Active
on interfaces: xe1/1 - ingress (Port ACL) xe1/2 -
ingress (Router ACL) xe1/3 - ingress (Router ACL)
```

show mac access-lists

Use this command to display MAC access lists.

Command Syntax `show mac access-lists (WORD|) (expanded|summary|)`

Parameters

`WORD`	Access-list name.
`expanded`	Expanded access-list.
`summary`	Summary of access-list.

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show mac access-lists MAC
access list Macrule2 default
deny-all MAC access list
Macrule3
10 permit host 0000.1234.1234 any
20 deny host 1111.1111.AAAA any 65535
30 permit host 2222.2222.AAAA any 65535
40 permit 0000.3333.3333 0000.0000.FFFF 4444.4444.4444
0000.0000.FFFF default deny-all [match=1126931077]

# show mac access-lists summary MAC ACL
Macrule3 statistics enabled Total ACEs
Configured: 4 Configured on interfaces:
sa3 - ingress (Router ACL) sa8 -
ingress (Port ACL) vlan1.3 - ingress
(Router ACL) xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router
```

```
ACL) xe1/3 - ingress (Router ACL)
Active on interfaces:
xe1/1 - ingress (Port ACL) xe1/2 -
ingress (Router ACL) xe1/3 - ingress
(Router ACL)
```

show running-config aclmgr

Use this command to display the entire access list configurations along with the attachment to interfaces.

Command Syntax `show running-config aclmgr`

Parameters

None

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
>enable
#show running-config aclmgr ip
access-list ip-acl-01
11 permit ip 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255 12
deny ip 30.0.0.2 0.0.0.255 182.124.0.3/24 default deny-all
mac access-list mac-acl-01 10 permit host 0000.1234.1234
any 20 permit host 0000.1111.AAAA any ipv4 cos 3 vlan 3
default deny-all !
ipv6 access-list ipv6-acl-01
10 deny ipv6 3ffe::/64 4ffe::/64 dscp af43 20
permit ipv6 78fe::/64 68fe::/64 dscp cs3 default
deny-all ! interface xe1/1 ip access-group ip-
acl-01 in !
```

show running-config access-list

Use this command to show the running system status and configuration details for MAC and IP access lists.

Command Syntax `show running-config access-list`

Parameters

None

Default

None

Command Mode

Privileged Exec mode, Configure mode and Router-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show running-config access-list ip
access-list abd 10 deny any any any
! mac access-list abc
remark test
10 deny any any !
```

show running-config ipv6 access-list

Use this command to show the running system status and configuration details for IPv6 access lists.

Command Syntax `show running-config ipv6 access-list`

Parameters

None

Default

None

Command Mode

Privileged Exec mode, Configure mode and Router-map mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show running-config ipv6 access-list ipv6
access-list test 10 permit any any any !
```

© Symanitron Proprietary

CHAPTER 6 Traffic Engineering Commands

This chapter provides a reference of the NSM Traffic Engineering (TE) command. Most commands are executed in TE link mode.

This chapter includes the following commands:

- data-link
- description
- ip address
- label-switching
- remote ip address
- remote-link-id
- reservable-bandwidth
- show running-config te-link
- show te-link
- shutdown
- te-link

data-link

Use this command to associate data links with TE links. Only data-links can be associated to a TE link. Attempting to map multiple data links to the same TE link returns an error.

Use the `no` option with this command to remove an existing data link from a TE link.

Command Syntax `data-link IFNAME`

`no data-link IFNAME`

Parameter

`IFNAME`	Indicate the interface name.

Command Mode

TE Link mode

Examples

```
#configure terminal
(config)#te-link te1 local-link-id 172.1.1.1
(config-te)#data-link eth1

(config-te)#no data-link eth1
(config-te)#data-link eth2
```

description

Use this command to provide a TE Link-specific description.

Use the `no` option with this command to remove the description.

Command Syntax `description`

```
LINE no description
```

Parameters

`LINE`	Text describing the specific interface.

Command Mode

TE Link mode

Examples

```
#configure terminal
          (config)#te-link te1 local-link-id 172.1.1.1
          (config-te)#description This is for Testing
```

ip address

Use this command to set the IP address for an interface.

Use the `no` parameter with this command to remove the IP address from an interface.

Command Syntax `ip address`

```
A.B.C.D/M no ip address
(A.B.C.D/M |)
```

Parameters

`A.B.C.D/M`	Specify the IP address and prefix length of an interface.

Command Mode

Interface mode

Examples

```
(config)#interface eth0
(config-if)#ip address 10.10.10.50/24
```

label-switching

Use this command to enable label-switching on a TE link.

Use the no option with this command to disable label-switching on a TE link.

Command Syntax `label-switching` `no label-switching`

Parameters

None

Command Mode

TE Link mode

Example

```
#configure terminal
  (config)#te-link te1 local-link-id 172.1.1.1
(config-te)#label-switching
```

remote ip address

Use this command to set a remote IP address for an interface.

Use the `no` parameter with this command to remove the IP address from an interface.

Command Syntax `remote ip address`

`A.B.C.D/M no remote ip address`

`(A.B.C.D/M |)`

Parameters

`A.B.C.D/M`	Specify the IP address and prefix length of an interface.

Command Mode

Interface mode

Examples

```
(config)#interface eth0 (config-if)#remote
ip address 10.10.10.50/24
```

remote-link-id

Use this command to configure remote link id for each TE link.

Use the no option with this command to remove the remote link ID from a TE link.

Command Syntax `remote-link-id`

`A.B.C.D` `no` `remote-link-id`

`(A.B.C.D|)`

Parameters

`A.B.C.D`	Remote link ID in IPv4 address format.

Command Mode

TE Link mode

Examples

```
#configure terminal
(config)#te-link te1 local-link-id 172.1.1.1
(config-te)#remote-link-id 172.1.2.3
```

reservable-bandwidth

Use this command to specify the maximum reservable bandwidth per interface. This value can be a larger or smaller value than `max-bandwidth`. When no max-reservable-bandwidth is specified, the default is equal to the `maxbandwidth`. Use the `no` parameter to remove the maximum reservable, and use the maximum bandwidth.

Use the `no` parameter with this command to disable the configuration.

Comman

d

Syn

tax

erv
abl
e-
ban
dwi
dth
BAN
DWI
DTH
no
res
erv
abl
e-
ban
dwi
dth
```

Parameters

`BANDWIDTH`	<1-999>k for 1 to 999 kilobits/s
	<1-999>m for 1 to 999 megabits/s
	<1-100>g for 1 to 100 gigabits/s

Command Mode

Interface mode

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#reservable-bandwidth 100m
```

show running-config te-link

Use this command to show the running system status of TE-link configurations.

Command Syntax `show running-config te-link show running-config te-link TLNAME`

Parameters

`TLNAME`	Display the TE link name

Command Mode

Privileged Exec mode

Example

```
>enable
#show running-config te-link new-te-123 !
```

show te-link

This command is used to display the properties for a particular TE link.

Command Syntax `show te-link (TLNAME|)`

Parameter

`TLNAME`	Displays the name of a TE link.

Command Mode

Exec mode

Example

The following example is sample output for this command:

```
#show te-link te1 te-
link te1
        description test
  Data-link: eth1
  Local link-id: 2.3.4.5
  Remote-link-id: 3
        IP address: 10.10.10.50/24
  Remote IP address: 10.10.10.51/24
  Index 2 mtu 1500
    <UP,POINT-TO-POINT,RUNNING >
  Control Adjacency: Rtr2
         Link ID: 22.2.2.2
    Administrative Group(s): None
  TE Metric 20
  Bandwidth 100m
  Maximum reservable bandwidth 70m
  DSTE Bandwidth Constraint Mode is MAM
    Bandwidth Constraint for Class Type default is
70m
  Available b/w for TE-CLASS 0 {a2, 5} is 0
    Maximum LSP b/w at Priority 0 is 0
  Maximum LSP b/w at Priority 1 is 0
        Maximum LSP b/w at Priority 2 is 70m
        Maximum LSP b/w at Priority 3 is 70m
        Maximum LSP b/w at Priority 4 is 70m
        Maximum LSP b/w at Priority 5 is 70m
        Maximum LSP b/w at Priority 6 is 70m
        Maximum LSP b/w at Priority 7 is 70m
  Minimum LSP Bandwidth is 10m
```

```
  Switching Capability: PSC1
  Encoding Type:
Packet   Protection:
1:1   risk-group 2, 3
mtu: 1500
#
```

shutdown

Use this command to shut down the selected TE link.

Use the `no` form of this command to disable this function.

Command Syntax `shutdown`

```
no shutdown
```

Parameters

None

Command Mode

TE Link mode

Examples

```
#configure terminal
         (config)#te-link te1 local-link-id 172.1.1.1
(config-te)#shutdown
```

te-link

Use this command to create a TE (traffic engineering) link and set its local-link-id.

Use the `no` option with this command to delete an existing TE link.

Command Syntax `te-link TLNAME te-link TLNAME local-link-id A.B.C.D (numbered |) no te-link TLNAME ((local-link-id A.B.C.D (numbered |))|)`

Parameters

`TLNAME`	Name of the TE link. `local-link-id`
	Local link Identifier.
`A.B.C.D`	Local interface ID expressed in IPv4 address format.
`numbered`	The data link type is numbered.

Command Mode

Configure mode

Examples

```
#configure terminal
(config)#te-link te1 local-link-id 172.1.1.1

#configure terminal
(config)#te-link te1 local-link-id 1.2.3.4

#configure terminal
(config)#te-link te1 local-link-id 1.2.3.4 numbered
```

CHAPTER 7 Control Channel Mode Commands

The commands in this chapter are issued in the NSM Control Channel mode. It includes the following commands:

- control-channel
- description
- local-address
- show control-channel
- show running-config control-channel
- shutdown

control-channel

Use this command to create a new Control Channel. It is also used to identify a control-channel ID (`cc-id`), and designate the local and remote addresses used by the control channel. Use the `no` option with this command to delete an existing Control Channel.

Command Syntax `control-channel CCNAME`

```
control-channel CCNAME cc-id <1-4294967295> local-address A.B.C.D peer-address
  A.B.C.D no control-channel CCNAME cc-id <1-4294967295> local-address A.B.C.D
peer-address A.B.C.D
```

Parameters

`CCNAME`	Control channel name.
`cc-id`	Control channel parameters.
`<1-4294967295>`	Control channel ID value in integer format.
`local-address`	Control channel local address.
`A.B.C.D`	Control channel local address in IPv4 address format.
`peer-address`	Control channel local address.
`A.B.C.D`	Control channel peer address in IPv4 address format.

Command Mode

Configure mode

Example

```
#configure terminal
(config)#control-channel cc1 cc-id 22 local-address 2.2.2.2 peer-address
4.4.4.4
(config-cc)#

(config-cc)#description This is for Testing
```

description

Use this command to provide an Control Channel-specific description.

Use the `no` parameter to remove the description.

Command Syntax

```
description
LINE          no
description
```

Parameter

`LINE`	Characters describing this control channel.

Command Mode

Control Channel mode

Examples

```
(config)#control-channel new cc-id 123 local-address 123.4.5.67 peer-address
123.4.5.68
(config-cc)#description Connected to eth1

(config-cc)#no description
```

local-address

Use this command to set a local IP address for an interface.

Use the `no` parameter with this command to remove the IP address from an interface.

Command Syntax `local-address A.B.C.D no local-address (A.B.C.D/M |)`

Parameters

`A.B.C.D/M`	Specify the IP address and prefix length of an interface.

Command Mode

Interface mode

Examples

```
(config)#interface eth0
(config-if)#local-address 10.10.10.50/24
```

show control-channel

Use this command to display information about a control channel.

Command Syntax `show control-channel (CCNAME|)`

Parameter

`CCNAME`	Specify name of the control channel.

Command Mode

Exec mode and Privileged Exec mode

Example

The following is a sample output of this command:

```
==============================
Control-Channel : newer
  Gifindex : 20
  Local-address : 1.2.3.4
  Peer-address : 1.2.3.5
  Control-Channel ID : 12345
  Interface binding: N/A
  Belong to Control-Adjacency : N/A
  Status DOWN : admin Up   operational Down   NSM Down
  Last UP Time : 00:00:00
  Last Down Time : 20:17:55
==============================
Control-Channel : new
  Description Control Channel specific description :
  Gifindex : 18
  Local-address : 1.2.3.4
  Peer-address : 1.2.3.4
  Control-Channel ID : 123
  Interface binding: N/A
  Belong to Control-Adjacency : N/A
  Status DOWN : admin Up   operational Down   NSM Down
  Last UP Time : 18:49:31
```

```
                                                                    Last Down
    Time : 18:49:27
    ================================
    #
```

show running-config control-channel

Use this command to show the complete status and configuration of a control channel configuration.

Command Syntax `show running-config control-channel show running-config control-channel CCNAME`

Parameters

`CC_NAME`	Specify name of the control-channel.

Command Mode

Privileged Exec mode, Configure mode, Router mode

Example

```
(config)#show running-config control-channel no
shutdown

 !
!
(config)#
```

shutdown

Use this command to shut down the selected control channel.

Use the `no` form of this command to disable this function.

Command

Syntax

```
shutdown
no
shutdown
```

Parameters

None

Command Mode

Control Channel mode

Examples

The following example shows the use of the `shutdown` command.

```
(config)#control-channel new cc-id 123 local-address 123.4.5.67 peer-
address 123.4.5.68
(config-cc)#shutdown

(config-cc)#no shutdown
```

© Symanitron Proprietary

CHAPTER 8 Control Adjacency Commands

The commands in this chapter are issued in the Control Adjacency mode. It includes the following commands:

- control-adjacency
- description
- show control-adjacency
- show running-config control-adjacency
- te-link

control-adjacency

Use this command to create a new Control Adjacency with a neighbor router. The command also configures a peer address for the control adjacency, and provides the option to specify whether it is statically configured or should be managed using LMP.

Use the `no` option with this command to remove an existing control adjacency.

Command Syntax `control-adjacency CADJNAME peer-address A.B.C.D (static |using-lmp |) no control-adjacency CADJNAME ((peer-address A.B.C.D (static |using-lmp|))|)` **Parameters**

`CADJNAME`	Control adjacency name in text format.
`A.B.C.D`	Control adjacency peer address in IPv4 address format.
`peer-address`	Control Adjacency Parameters.
`static`	Static configuration of control adjacency.
`using-lmp`	Control adjacency is managed using Link Management Protocol (LMP).

Command Mode

Configure mode

Example

```
#configure terminal
(config)#control-adjacency rtr2 peer-address 4.4.4.4
static (config-ca)#
```

description

Use this command to provide a control adjacency-specific description.

Use the `no` parameter to remove the description.

Command Syntax `description LINE no description`

Parameter

`LINE`	Characters describing this control adjacency.

Command Mode

Control Adjacency mode

Examples

```
                (config)#control-adjacency new peer-address 1.2.3.4 static
(config-ca)#description Connected to eth1

(config-ca)#no description
```

show control-adjacency

This command is used to display the properties for a particular Control Adjacency.

Command Syntax `show control-adjacency (CANAME|)`

Parameter

`CANAME`	Name of the control adjacency

Command Mode

Exec Mode

Example

The following example is sample output for this command:

```
#show control-adjacency ca2 Control-channel
Rtr2 description test Control Channels:
cc1, cc2
Primary Control Channel : cc1 TE Links: te1, te2
peer-address 3.3.3.3 index 2 <UP, RUNNING>
LMP is in USE
```

show running-config control-adjacency

Use this command to show the running system status and details for any control adjacency configuration.

Command Syntax `show running-config control-adjacency show running-config control-adjacency CANAME`

Parameter

`CANAME`	Indicate the control adjacency name.

Command Mode

Privileged Exec mode

Example

```
>enable
#show running-config control-adjacency !
```

te-link

Use this command to configure a TE link name.

Use the `no` parameter to remove a TE link name.

Command Syntax `te-link TELNAME no te-link TELNAME`

Parameters

None

Command Mode

Control Adjacency mode

Examples

```
#configure terminal
(config)#control-adjacency new peer-address 1.2.3.4 static (config-ca)#te-link new-link

                (config)#control-adjacency new peer-address 1.2.3.4 static (config-ca)#no te-link new-link
```

CHAPTER 9 Tunneling Commands

This chapter contains commands for IP tunneling.

- interface tunnel
- tunnel checksum
- tunnel destination
- tunnel dmac
- tunnel mode
- tunnel mode ipv6ip
- tunnel path-mtu-discovery
- tunnel source
- tunnel tos
- tunnel ttl

interface tunnel

Use this command to create a new tunnel interface.

Use the `no` parameter to destroy the tunnel interface.

Command Syntax `interface tunnel <0-2147483647> no interface tunnel <0-2147483647>`

Parameter

`<0-2147483647>` Specify a tunnel interface number.

Default

Disabled

Command Mode

Configure mode

Example

```
#configure terminal
(config)#interface tunnel 100
(config-if)#
```

tunnel checksum

Use this command to enable a checksum feature for the tunnel. When configuring the tunnel checksum, make sure to:

- configure the tunnel checksum feature before configuring the tunnel source and destination.
- configure the tunnel checksum on both ends of the tunnel.

Use the `no` parameter to disable the feature.

Command Syntax `tunnel`

```
checksum no tunnel
checksum
```

Parameters

None

Default

Disabled

Command Mode

Interface mode

Examples

```
#configure terminal
(config)#interface tunnel 0
(config-if)#tunnel mode gre
(config-if)#tunnel checksum
(config-if)#tunnel source 192.168.1.1
```

```
(config-if)#tunnel destination 192.168.254.2
```

tunnel destination

Use this command to specify a tunnel destination address in an IPv4 portion.

Use the `no` parameter to undo the address.

Command Syntax `tunnel destination A.B.C.D no tunnel destination`

Parameter

`A.B.C.D`	Specify a tunnel destination IPv4 address.

Command Mode

Interface mode

Examples

```
#configure terminal
(config)#interface tunnel 200
(config-if)#tunnel mode ipip
(config-if)#tunnel source 10.10.0.1
(config-if)#tunnel destination 10.11.0.1
```

tunnel dmac

Use this command to set a destination MAC address for tunneled packets. This command supports IP-in-IP tunneling on Broadcom.

Use the `no` option with this command to remove the destination MAC address.

Command Syntax `tunnel`

`dmac/mac MAC no`

`tunnel dmac`

Parameter

`MAC`	Destination address in MAC format.

Default

If a specific MAC address is not set with this command, all tunneled packets are sent with a destination address of 0.

Command Mode

Interface mode

Examples

```
broadcom(config)#interface tunnel 7
broadcom(config-if)#tunnel dmac 1213.2322.123
```

tunnel mode

Use this command to configure an IPv4 tunnel mode. This command specifies a tunnel encapsulation mode for either GRE and IPIP mode The GRE tunnel mode is used for IPv4-to-IPv4 tunneling.

Use the `no` parameter to remove the configuration from a mode.

Command Syntax `tunnel mode (ipip|gre) no tunnel mode`

Parameters

`ipip` IPIP tunnel mode. `gre` Generic Routing Encapsulation (GRE)

tunnel mode.

Command Mode

Interface mode

Example

```
#configure terminal
(config)#interface tunnel 2
(config-if)#tunnel source 192.168.1.1
(config-if)#tunnel destination 192.168.2.1
(config-if)#tunnel mode gre
```

tunnel mode ipv6ip

Use this command to configure an IPv6 tunnel mode. This command specifies a tunnel encapsulation mode for either GRE and IPIP mode The GRE tunnel mode is used for IPv6-to-IPv6 tunneling.

Use the `no` parameter to remove the configuration from a mode.

Command Syntax `tunnel mode ipv6ip (6to4|isatap|) no tunnel mode`

Parameters

`6to4` IPv6 automatic tunnelling using 6to4. `isatap` IPv6 automatic tunnelling using ISATAP.

Command Mode

Interface mode

Examples

```
#configure terminal
(config)#interface tunnel 0
(config-if)#tunnel source 10.10.1.1
(config-if)#tunnel destination 10.10.2.1
(config-if)#tunnel mode ipv6ip 6to4
```

tunnel path-mtu-discovery

Use this command to enable path Maximum Transmission Unit (MTU) discovery in the underlying tunnel interface.

Use the `no` parameter to disable this feature.

Command Syntax `tunnel path-mtu-discovery` `no tunnel path-mtu-discovery`

Parameters

None

Default

Disabled

Command Mode

Interface mode

Examples

```
#configure terminal
(config)#interface tunnel 0
(config-if)#tunnel mode gre
(config-if)#tunnel source 192.168.0.1
(config-if)#tunnel destination 10.0.0.1
(config-if)#tunnel path-mtu-discovery
```

tunnel source

Use this command to specify a tunnel source address in a IPv4 portion.

Use the `no` parameter to undo the tunnel source address.

Command Syntax `tunnel source A.B.C.D no tunnel source`

Parameter

A.B.C.D	IPv4 tunnel source address.

Command Mode

Interface mode

Examples

```
#configure terminal
(config)#interface tunnel 0
(config-if)#tunnel mode gre
(config-if)#tunnel destination 10.10.1.1
(config-if)#tunnel source 10.11.2.1
```

tunnel tos

Use this command to specify a value of Type of Service (TOS) in the tunnel IPv4 encapsulation header.

Use the `no` parameter to make `0` the default value.

Command Syntax `tunnel tos <0-255>`

`no tunnel tos`

Parameter

`<0-255>`	Specify a type of service integer.

Default

The default TOS value is 0.

Command Mode

Interface mode

Examples

```
#configure terminal
(config)#interface tunnel 0
(config-if)#tunnel mode gre
(config-if)#tunnel destination 192.168.10.2
(config-if)#tunnel source 192.168.11.1
(config-if)#tunnel tos 10
```

tunnel ttl

Use this command to specify a value of Time to Live (TTL) in the tunnel IPv4 encapsulation header. Enable the `pathmtu-discovery` before setting the TTL value. However, the first time you set the TTL value, and the `path-mtudiscovery` is not set, the system automatically enables the `path-mtu-discovery`.

Use the `no` parameter to inheriting the underlying physical interface value by default.

Command Syntax `tunnel`

`ttl <1-255> no tunnel`

`ttl <1-255>`

Parameter

`<1-255>`	Specify a Time to Live integer.

Default

By default, physical interface value is inherited.

Command Mode

Interface mode

Example

```
#configure terminal
(config)#interface tunnel 0
(config-if)#tunnel mode gre
(config-if)#tunnel destination 192.168.128.1
(config-if)#tunnel source 192.168.0.1
```

```
(config-if)#tunnel ttl 255
```

CHAPTER 10 Remote Monitoring Commands

This chapter provides an alphabetized reference for each Remote Monitoring (RMON) CLI command. It includes the following commands:

- rmon alarm
- rmon clear
- rmon collection history
- rmon collection stats
- rmon debug
- rmon event
- show rmon alarm
- show rmon event
- show rmon history
- show rmon statistics
- snmp restart rmon

rmon alarm

Use this command to configure alarm parameters, such as, alarm type, thresholds, and corresponding events on crossing the threshold for a particular variable.

Use the `no` form of this command to remove the alarm configuration.

Command Syntax

```
rmon alarm <1-65535> (WORD) interval <1-4294967295> (delta | absolute) rising-threshold
            event <1-65535> falling-threshold event <1-65535> (owner WORD|)
  no rmon alarm <1-65535>
```

Parameters

`<1-65535>`	Alarm entry index value.
`WORD`	Variable Object Identifier (OID) name to be monitored.
`interval`	Polling interval in seconds <1-4294967295>.
`delta`	Alarm sample type of delta.
`absolute`	Alarm sample type of absolute.
`rising-threshold`	Rising threshold value of the alarm entry.
`event`	Event corresponding to the alarm crossing the rising threshold value of the alarm entry <165535>.
`falling-threshold`	Falling threshold value of the alarm entry.
`event`	Event corresponding to the alarm crossing the falling threshold value of the alarm entry <1-65535>.
`owner`	Owner name to identify entry.

Default

No default alarm is created.

Command Mode

Configure mode

Examples

```
#configure terminal
(config)#rmon alarm 229 etherStatsEntry.1.5 interval 50 delta rising-threshold
400 event 70 falling-threshold 600 event 1 owner new
```

rmon clear

Use this command to clear RMON counters.

Command Syntax `rmon clear counters`

Parameters `counters` Clears RMON counters.

Command Mode

Interface mode

Example

```
(config-if)#rmon clear counters
```

rmon collection history

Use this command to configure a history statistics control group. History statistics parameters can be requested buckets, interval and owner name on a particular interface. The number of history statistics buckets, and the interval to collect them, can be specified. The system based on the available memory configures the granted buckets. The granted buckets are same as the requested buckets.

Use the `no` form of this command to remove the history control configuration.

Command Syntax

```
rmon collection history <1-65535> (buckets <1-65535>|)(interval <1-3600>|)
(owner

  WORD|)   no   rmon   collection

history <1-65535>
```

Parameters

`<1-65535>`	Alarm entry index value.
`interval`	Polling interval in seconds <1-4294967295>.
`buckets`	Number of requested buckets <1-65535>.
`owner`	Owner name to identify entry.

Default

No default alarm is created.

Command Mode

Interface mode

Example

```
#configure terminal
(config)#interface eth1
```

```
(config-if)#rmon collection history 200 buckets 500 interval 600 owner
herbert
```

rmon collection stats

Use this command to configure an Ethernet statistics parameter, such as, index and owner name, on a particular interface.

Use the `no` form of this command to remove the collection statistics configuration.

Command Syntax `rmon collection stats <1-65535> (owner WORD|) no rmon collection stats <1-65535>`

Parameters

`<1-65535>` Specify buckets history index <1-65535>. Default is 50. `owner`

Owner name to identify entry.

Default

Ethernet statistics probe is not running.

Command Mode

Interface mode

Example

```
#configure terminal
(config)#interface eth1
(config-if)#rmon collection stats 200 owner herbert
```

rmon debug

Use this command to specify the set of debug options for RMON.

Use the `no` parameter with this command to disable the debugging option.

Command Syntax `rmon debug no rmon debug`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode Example

```
#rmon debug
```

rmon event

Use this command to configure event parameters, such as, event type, description, and the community string corresponding to the trap if the event type is trap. The configured trap community does not take effect as the trap sending is handled by the SNMP daemon.

Use the `no` form of this command to remove the event configuration.

Command Syntax `rmon event <1-65535> (log |)(trap WORD |) (description WORD|) (owner WORD|) no rmon event <1-65535>`

Parameters

`<1-65535>`	Event entry index value.
`log`	Log event type
`trap`	Trap event type
`description`	Event entry description
`owner`	Owner name to identify entry.
`WORD`	Community string corresponding to the trap

Default

No default event is created.

Command Mode

Configure mode

Example

```
#configure terminal
(config)#rmon event 299 log description cond3 owner alfred
```

show rmon alarm

Use this command to display the alarms and threshold configured for the RMON probe.

Command Syntax `show rmon alarm`

Parameters

None

Command Mode

Exec and Privileged Exec modes

Example

```
#show rmon alarm
```

show rmon event

Use this command to display the events configured for the RMON probe.

Command Syntax `show rmon event`

Parameters

None

Command Mode

Exec and Privileged Exec modes

Example

```
#show rmon event
```

show rmon history

Use this command to display the history Ethernet statistics collected on a particular interface.

Command Syntax `show rmon history`

Parameters

None

Command Mode

Exec and Privileged Exec modes

Example

```
#show rmon history
```

show rmon statistics

Use this command to display the Ethernet statistics collected on a particular interface.

Command Syntax `show rmon statistics`

Parameters

None

Command Mode

Exec and Privileged Exec modes

Example

```
#show rmon statistics
```

snmp restart rmon

Use this command to restart SNMP in Remote Monitoring (RMON).

Command Syntax `snmp restart rmon`

Parameters

None

Command Mode

Configure mode

Examples

```
(config)#snmp restart rmon
```

CHAPTER 11 Unicast Reverse Path Forwarding Check

This chapter provides an alphabetized reference for each of the Unicast Reverse Path Forwarding (uRPF) commands. It includes the following commands:

- ip verify unicast source reachable-via
- ipv6 verify unicast source reachable-via

ip verify unicast source reachable-via

Use this command to enable Unicast Reverse Path Forwarding (uRPF) checking on the interface for IPv4. The interface should be a Layer 3 type.

Use the no form of this command to disable uRPF checking.

Command Syntax `ip verify unicast source reachable-via {any [allow-default] | rx} no ip verify unicast source reachable-via`

Parameters `any` Loose mode: source is reachable via any interface; the source IP address for a packet must appear in the routing table

`allow-default`
Allow default route to match when checking source address; otherwise, a default route is not considered in loose mode

`rx` Strict mode: source is reachable via the interface on which the packet was received

Command Mode

Interface mode

Examples

```
(config-if)#ip verify unicast source reachable-via rx
```

```
(config-if)#ip verify unicast source reachable-via any (config-if)#no ip
verify unicast source reachable-via
```

ipv6 verify unicast source reachable-via

Use this command to enable Unicast Reverse Path Forwarding (uRPF) checking on the interface for IPv6. The interface should be a Layer 3 type.

Use the no form of this command to disable uRPF checking.

Command Syntax `ipv6 verify unicast source reachable-via {any [allow-default] | rx} no ipv6 verify unicast source reachable-via`

Parameters `any` Loose mode: source is reachable via any interface; the source IP address for a packet must appear in the routing table

`allow-default` Allow default route to match when checking source address; otherwise, a default route is not considered in loose mode

`rx` Strict mode: source is reachable via the interface on which the packet was received

Command Mode

Interface mode

Examples

```
(config-if)#ipv6 verify unicast source reachable-via rx (config-
if)#ipv6 verify unicast source reachable-via any (config-if)#no

ipv6 verify unicast source reachable-via
```

© Symanitron Proprietary

CHAPTER 12 Internet Protocol Security Commands

This chapter is a reference for the Internet Protocol Security (IPsec) commands.

- address
- authentication
- clear crypto isakmp
- clear crypto sa
- clear crypto sa entry
- clear crypto sa map
- clear crypto sa peer
- crypto ipsec security-association lifetime
- crypto ipsec transform-set
- crypto isakmp enable
- crypto isakmp policy
- crypto key generate rsa
- crypto map (Configure Mode)
- crypto map (Interface Mode)
- crypto map local-address
- encryption
- group
- hash
- ike-version
- ipv6-address
- lifetime
- match address
- mode
- peer
- peer public-key
- psk key
- rsa key
- set ipv6 peer
- set peer
- set security-association lifetime

- set session-key
- set transform-set
- show crypto ipsec transform-set
- show crypto isakmp policy
- show crypto-map interface
- show ipsec status

address

Use this command to set the IPv4 address of an peer in an IKE (Internet Key Exchange) policy created with the crypto isakmp policy command.

Use the `no` form of this command to remove a peer address.

Command Syntax

```
address A.B.C.D no
address A.B.C.D
```

Parameters

`A.B.C.D`	IPv4 address.

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1
(config-isakmp)#address 10.1.1.2
```

authentication

Use this command to set the authentication method in an IKE (Internet Key Exchange) policy created with the crypto isakmp policy command.

Use the `no` form of this command to reset the authentication method to its default (pre-share).

Command Syntax

```
authentication  pre-share
no authentication
```

Parameters `pre-share` Preshared keys specified manually

Defaults

Pre-share

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1
(config-isakmp)#authentication pre-share
```

clear crypto isakmp

Use this command to clear active IKE (Internet Key Exchange) connections.

Command Syntax `clear crypto isakmp`

Parameters

None

Command Mode

Exec mode

Example

```
#clear crypto isakmp
```

clear crypto sa

Use this command to clear and reinitialize (if appropriate) IPSec security associations at the router. If the security associations are manually established, the security associations are deleted and reinitialized.

If you make configuration changes to security associations, the changes do not apply to existing security associations but to negotiations for future security associations. Use this command to restart all security associations so they use the most recent configuration settings. For manually established security associations, if you make changes that affect security associations you must give this command before the changes take effect.

Command Syntax

```
clear crypto sa
```

Parameters

None

Command Mode

Exec mode

Example

```
#clear crypto sa
```

clear crypto sa entry

Use this command to delete IPSec security associations for a given IP address, protocol, and security parameter index.

If you make configuration changes to security associations, these changes do not apply to existing security associations but to negotiations for future security associations. Use this command to restart all security associations so they use the most recent configuration settings. For manually established security associations, if you make changes that affect security associations you must give this command before the changes take effect.

Command Syntax `clear crypto sa entry destination-address A.B.C.D protocol (ah|esp) spi SPI`

Parameters

`A.B.C.D`	Destination address
`ah`	Authentication Header protocol
`esp`	Encapsulating Security Payload protocol
`SPI`	Security parameter index (0-4096)

Command Mode

Exec mode

Example

```
(config)#clear crypto sa entry destination-address 10.1.1.2 protocol esp
spi 100
```

clear crypto sa map

Use this command to delete IPSec security associations for a given name.

If you make configuration changes to security associations, these changes do not apply to existing security associations but to negotiations for future security associations. Use this command to restart all security associations so they use the most recent configuration settings. For manually established security associations, if you make changes that affect security associations you must give this command before the changes take effect.

Command Syntax `clear crypto sa map MAP_NAME`

Parameter

`MAP_NAME`	Name of IP security associations (maximum length 127).

Command Mode

Exec mode

Example

```
(config)#clear crypto sa map New-map
```

clear crypto sa peer

Use this command to delete IPSec security associations for a given peer.

If you make configuration changes to security associations, these changes do not apply to existing security associations but to negotiations for future security associations. Use this command to restart all security associations so they use the most current configuration settings. In the case of manually established security associations, if you make changes that affect security associations you must give this command before the changes take effect.

Command Syntax `clear crypto sa ipv4 peer A.B.C.D clear crypto sa ipv6 peer X:X::X:X`

Parameter

`A.B.C.D`	IPv4 address of the peer.
`X:X::X:X`	IPv4 address of the peer.

Command Mode

Exec mode

Example

```
(config)#clear crypto sa ipv4 peer 123.12.12.123
```

crypto ipsec security-association lifetime

Use this command to change global lifetime values used when negotiating IPSec security associations. IPSec security associations use shared secret keys. These keys and their security associations time out together.

Assuming that a crypto map entry does not have lifetime values configured, when the router requests new security associations during negotiation, it specifies its global lifetime value in the request to the peer. When the router receives a negotiation request from the peer, it uses the smaller of the lifetime value proposed by the peer or the locally configured lifetime as the lifetime of the new security associations.

If you change a global lifetime, the change is only applied when the crypto map entry does not have a lifetime value specified. The change is not applied to existing security associations, but is used in future negotiations to establish new security associations. If you want the new settings to take effect sooner, you can clear all or part of the security association database by using the clear crypto sa command. The lifetime values are ignored for manually established security associations.

Use the `no` form of the command to reset the lifetime to its default value (3600 seconds).

Command Syntax `crypto ipsec security-association lifetime seconds LIFETIME no crypto ipsec security-association lifetime seconds`

Parameters

`LIFETIME`	Duration of the security association before expiring (120-2592000 seconds).

Default

3600 seconds (one hour)

Command Mode

Configure mode

Example

```
(config)#crypto ipsec security-association lifetime seconds 2000
```

crypto ipsec transform-set

Use this command to configure a transform set that defines protocols and algorithm settings to apply to IPSec protected traffic.

During security association negotiation, peers use a transform set when protecting data flows. Multiple sets can be configured, with one or more specified in a crypto map entry. When IKE is not used to establish security associations, one transform set must be used. The transform set is not negotiated.

A transform set specifies one or two IPSec security protocols (either ESP or AH or both) and algorithms. If one or more transforms are specified in this command for an existing transform set, the specified transforms replace the existing transforms.

If you change a transform set definition, the change is only applied to crypto map entries that reference the transform set. The change is not applied to existing security associations, but is used in future negotiations to establish new security associations. If you want the new settings to take effect sooner, you can clear all or part of the security association database using the clear crypto sa command. Use the `no` form of the command to delete a transform set.

Command Syntax `crypto ipsec transform-set NAME ah (none|ah-md5|ah-sha1) crypto ipsec transform-set NAME esp-auth (none|esp-md5|esp-sha1) esp-enc (esp-null|esp-3des|esp-aes|esp-aes192|esp-aes256|esp-blf|esp-blf192|esp-blf256|espcast)`

`no crypto ipsec transform-set NAME`

Parameters

`NAME`	Name of the transform set.
`ah`	Authentication Header protocol
`none`	No authentication.
`ah-md5`	Authentication Header with Message Digest 5 (MD5) Hashed Message Authentication Code (HMAC) variant.
`ah-sha1`	Authentication Header with Secure Hash Algorithm 1 (SHA-1) Hashed Message Authentication Code (HMAC) variant.
`esp-auth`	Encapsulating Security Payload authentication protocol
`none`	No authentication.
`esp-md5`	Encapsulating Security Payload with Message Digest 5 (MD5) Hashed Message Authentication Code (HMAC) variant.
`esp-sha1`	Encapsulating Security Payload with Secure Hash Algorithm 1 (SHA-1) Hashed Message Authentication Code (HMAC) variant.
`esp-enc`	Encapsulating Security Payload encryption protocol
`esp-null`	Encapsulating Security Payload null encryption.
`esp-3des`	Encapsulating Security Payload with 168-bit DES encryption (3DES or Triple DES).
`esp-aes`	Alternative AES.
`esp-aes192`	Alternative AES192.
`esp-aes256`	Alternative AES256.

`esp-blf` Alternative Blowfish. `esp-blf192` Alternative Blowfish192. `esp-blf256` Alternative Blowfish256. `esp-cast` Alternative Cast (IKEv1 not supported).

Command Mode

Configure mode

Example

```
(config)#crypto ipsec transform-set TS1 esp-auth esp-md5 esp-enc esp-
3des (config-transform)#
```

crypto isakmp enable

Use this command to globally enable IKE (Internet Key Exchange) for a peer router.

If you do not want IKE to be used in your IPSec implementation, disable IKE at all IPSec peers. If you disable IKE at one peer, you must disable it at all IPSec peers.

Use the `no` form of this command to disable IKE at the peer.

Command Syntax `crypto isakmp enable`

`no crypto isakmp enable`

Parameters

None

Default

IKE is disabled by default. IKE does not have to be enabled for individual interfaces, but is enabled globally for all interfaces at the router.

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1
(config-isakmp)#crypto isakmp enable
```

crypto isakmp policy

Use this command to define an IKE (Internet Key Exchange) policy and enter ISAKMP (Internet Security Association and Key Management Protocol) policy configuration mode.

IKE policies define a set of parameters to use during the IKE negotiation. These parameters are used to create IKE security associations.

You can configure multiple IKE policies for each peer participating in IPSec. When the IKE negotiation begins, it tries to find a common policy configured on both peers, starting with the highest priority policies as specified on the remote peer.

Use the `no` form of this command to delete an IKE policy.

Command Syntax `crypto isakmp policy`

`PRIORITY no crypto isakmp policy`

`PRIORITY`

Parameter

`PRIORITY`	Identifier/priority of the policy (<1-10000>).

Command Mode

Configure mode

Example

```
(config)#crypto isakmp policy 10
(config-isakmp)#
```

crypto key generate rsa

Use this command to generate a local RSA (Rivest-Shamir-Adleman) key.

Note: All keys are suffixed by `*.der`.

Use the `no` form of this command to delete a local RSA key.

Command Syntax `crypto key generate rsa KEYLABEL dn DNNAME (length <360-2048>|) no crypto key generate rsa KEYLABEL`

Parameters

`KEYLABEL`	Local key identifier for RSA key
`DNNAME`	Distinguished name of the RSA key-pair. Use the same name on the remote peer.
`<360-2048>`	Key length in bits (default 2048).

Command Mode

Configure mode

Example

```
(config)#crypto key generate rsa k1 dn moon
```

crypto map (Configure Mode)

Use this command to create or change a crypto map entry and enter crypto map configuration mode.

Once a crypto map entry has been created, you cannot change its setting at the global configuration level because these parameters determine which of the configuration commands are valid at the crypto map level. For example, once a map entry has been created as `ipsec-isakmp`, you cannot change it to `ipsec-manual`; you must delete and reenter the map entry.

A single crypto map set can contain a combination of `ipsec-isakmp` and `ipsec-manual` crypto map entries.

After you define crypto map entries, you can assign the crypto map set to interfaces using the crypto map (Interface Mode) command.

Use the `no` form of this command to delete a crypto map entry or set.

Command Syntax `crypto map MAP-NAME SEQ-NUM`

`ipsec-manual crypto map MAP-NAME SEQ-NUM`

`ipsec-isakmp no crypto map MAP-NAME`

`(SEQ-NUM|)`

Parameters

`MAP-NAME`	Name of the crypto map set (maximum length 127).
`SEQ-NUM`	Number of the crypto map entry <1-65535>.
`ipsec-manual`	Do not use IKE to establish IPSec security associations. `ipsec-isakmp` Use IKE to establish the IPSec security associations.

Command Mode

Configure mode

Example

```
(config)#crypto map MAP1 5 ipsec-isakmp
(config-crypto)#
```

crypto map (Interface Mode)

Use this command to apply a crypto map set to an interface.

Only one crypto map set can be assigned to an interface. If multiple crypto map entries have the same map name but a different `SEQ-NUM`, they are considered to be part of the same set and all are applied to the interface. The crypto map entry with the lowest `SEQ-NUM` is considered the highest priority and is evaluated first.

Use the `no` form of this command to remove a crypto map set from an interface.

Command Syntax `crypto map`

`MAP-NAME no crypto map`

`MAP-NAME`

Parameter

`MAP-NAME`Name of the crypto map set (maximum length 127).

Command Mode

Interface mode

Example

```
(config)#interface eth1
(config-if)#crypto map MAP1
```

crypto map local-address

Use this command to specify an interface to use for this crypto map to identify itself to peers.

If you apply the same crypto map to two interfaces and do not use this command, two separate security associations (with different local IP addresses) could be established to the same peer for similar traffic. If you use the second interface as redundant to the first interface, it might be preferable to have a single security association (with a single local IP address) created for traffic sharing the two interfaces. Having a single security association decreases overhead and makes administration simpler.

Use the `no` form of this command to remove the configuration.

Command Syntax `crypto map MAP-NAME local-address IFNAME no crypto map MAP-NAME local-address`

Parameters

`MAP-NAME`	Name of the crypto map set (maximum length 127).
`IFNAME`	Interface name.

Command Mode

Configure mode

Example

```
(config)#crypto map MAP1 local-address eth1
```

encryption

Use this command to set the encryption algorithm in an IKE (Internet Key Exchange) policy created with the crypto isakmp policy command.

Use the `no` form of this command to set the encryption algorithm to its default value (3DES).

Command Syntax `encryption (aes|3des) no encryption`

Parameters

`aes`	Use 56-bit AES-CBC as the encryption algorithm.
`3des`	Use 168-bit DES (3DES or triple DES) as the encryption algorithm.

Default

3DES

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1
(config-isakmp)#encryption 3des
```

group

Use this command to set a Diffie-Hellman group identifier (length of the modulus) in an IKE (Internet Key Exchange) policy created with the crypto isakmp policy command.

Use the `no` form of this command to set the group identifier to its default value (group 14: 2048 bits).

Command Syntax

```
group (1|2|14)
no group
```

Parameters

`1`	Group 1: 768 bits (modp768)
`2`	Group 2: 1024 bits (modp1024)
`14`	Group 14: 2048 bits (modp2048) (default)

Defaults

Group 14: 2048 bits (modp2048)

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1
(config-isakmp)#group 1
```

hash

Use this command to specify the hash algorithm in an IKE (Internet Key Exchange) policy created with the crypto isakmp policy command.

Use the `no` form of this command to set the hash algorithm to its default (SHA-1).

Command Syntax

```
hash (md5|sha)
no hash
```

Parameters `md5` Message Digest 5 (MD5) Hashed Message Authentication Code (HMAC) variant `sha`

Secure Hash Algorithm 1 (SHA-1) Hashed Message Authentication Code (HMAC) variant

Default

SHA-1 hash algorithm.

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1
(config-isakmp)#hash md5
```

ike-version

Use this command to set the version of IKE (Internet Key Exchange). Use the `no` form of this command to set the default (version 1 and 2).

Command Syntax `ike-version (1|2|both) no ike-version`

Parameters

`1`	IKE version 1
`2`	IKE version 2
`both`	IKE version 1 and 2 (default)

Default

SHA-1 hash algorithm.

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1
(config-isakmp)#ike-version 2
```

ipv6-address

Use this command to set the IP address of an peer in an IKE (Internet Key Exchange) policy created with the crypto isakmp policy command.

Use the `no` form of this command to remove a peer address.

Command Syntax `ipv6-address`

`X:X::X:X no ipv6-address`

`X:X::X:X`

Parameters

`X:X::X:X`	IPv6 address.

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1
(config-isakmp)#ipv6-address 2001:db8:0:1
```

lifetime

Use this command to set the lifetime of an IKE (Internet Key Exchange) security association.

When IKE begins negotiations, it first agrees upon the security parameters for its own session. The agreed-upon parameters are then referenced by an security association at each peer. The security association is retained by each peer until the security association's lifetime expires. Before a security association expires, it can be reused by subsequent IKE negotiations, which can save time when setting up new IPSec security associations. New IPSec security associations are negotiated before current IPSec security associations expire.

To save setup time for IPSec, configure a longer IKE security association lifetime. However, shorter lifetimes limit the exposure to attackers of this security association. The longer an security association is used, the more encrypted traffic can be gathered by an attacker and possibly used in an attack.

Note: When your local peer starts an IKE negotiation with a remote peer, an IKE policy can be selected only if the lifetime of the remote peer's policy is longer than or equal to the lifetime of the local peer's policy. Then, if the lifetimes are not equal, the shorter lifetime is selected. To restate this behavior: If the two peer's policies' lifetimes are not the same, the initiating peer's lifetime must be shorter and the responding peer's lifetime must be longer, and the shorter lifetime is used.

Use the `no` form of this command to reset the SA lifetime to its default value (10,800 seconds).

Command Syntax

```
lifetime
LIFETIME        no
lifetime
```

Parameters

`LIFETIME`	Duration of a security association before expiring (<60-86400> seconds).

Defaults

10,800 seconds

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1
(config-isakmp)#lifetime 20000
```

match address

Use this command to match an access list name for traffic which is protected by IPSec.

Use the `no` form of this command to remove an ACL from IPsec protection.

Command Syntax `match address ACCESSLIST-ID match ipv6-address ACCESSLIST-NAME no match address ACCESSLIST-ID no match ipv6-address ACCESSLIST-NAM`

Parameter

ACCESSLIST-ID

ACCESSLIST-NAME

Access-list name.

Command Mode

Crypto map configuration mode

Example

```
(config)#crypto map MAP1 5 ipsec-isakmp
(config-crypto)#match address ACL-25
```

mode

Use this command to set the mode of negotiation for a transform set.

Use the `no` form of this command to reset the mode to its default (tunnel).

Command Syntax `mode`

```
(tunnel|transport) no mode
```

Parameter

`tunnel`	The entire original IP packet is protected (default).
`transport`	The payload (data) of the original IP packet is protected.

Defaults

Tunnel mode

Command Mode

Transform set mode

Example

```
(config)#crypto ipsec transform set t1 esp-auth esp-sha1 esp-enc espaes192
(config-transform)#mode transport
```

peer

Use this command to set the IPSec peer name.

Use the `no` form of this command to remove the peer name.

Command Syntax `peer`

```
NAME   no   peer
NAME
```

Parameters

`NAME`	Peer name. This name should be same as the `DNNAME` parameter in the crypto key generate rsa command on the remote peer during RSA key generation.

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1
(config-isakmp)#peer SUN
```

peer public-key

Use this command to set an RSA (Rivest-Shamir-Adleman) public key for the peer. You must configure this key when you specify authentication as `rsa-sig` in an IKE policy.

This command enters ISAKMP public key mode, where you enter the public key from the RSA peer. You can enter up to four “chunks” of key data separated by spaces per line, on multiple lines. Use the `exit-key` command to terminate public key mode. The strings you enter are concatenated into a single key string.

Use the `no` form of this command to remove a public key.

Command Syntax `peer`

```
public-key no peer
public-key
```

Parameters

None

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1 (config-
isakmp)#peer public-key (config-isakmp-
pubkey)#abcd 1w22w ssss2 sskk3 (config-
isakmp-pubkey)#ddjjj 33 ddddd22 kkff (config-
isakmp-pubkey)#ffff eeqq (config-isakmp-
pubkey)#exit-key (config-isakmp)#
```

psk key

Use this command to configure a preshared authentication key. You must configure this key when you specify preshared keys in an IKE policy and at both peers.

If an IKE policy includes preshared keys as the authentication method, these preshared keys must be configured at both peers. Otherwise, the policy cannot be used and the policy is not submitted for matching by the IKE process.

Use the `no` form of this command to remove a preshared authentication key.

Command Syntax `psk`

```
key  KEY  no  psk
key KEY
```

Parameters

`KEY`	Preshared key; any combination of alphanumeric characters up to 128 bytes.

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto isakmp policy 1
(config-isakmp)#psk key myKey123
```

rsa key

Use this command to configure a local RSA (Rivest-Shamir-Adleman) key. You must configure this key when you specify authentication as `rsa-sig` in an IKE policy.

Use the `no` form of this command to remove a local RSA key.

Command Syntax `rsa`

```
key LABEL no rsa
key LABEL
```

Parameters

`LABEL`	Local RSA key identifier. This should be same as specified when generating a local RSA key.

Command Mode

ISAKMP policy configuration mode

Example

```
(config)#crypto key generate rsa k1 dn moon
(config)#crypto isakmp policy 1 (config-
isakmp)#authentication rsa-sig (config-
isakmp)#rsa key k1
```

set ipv6 peer

Use this command to specify an IPSec IPv6 peer in a crypto map entry created by the crypto map (Configure Mode) command.

For `ipsec-isakmp` crypto map entries, you can specify multiple peers by repeating this command. The peer to which packets are actually sent is determined by the last peer from which the router received either traffic or a negotiation request for a given data flow. If the attempt fails with the first peer, IKE tries the next peer on the crypto map list.

For `ipsec-manual` crypto map entries, you can only specify one IPSec peer per crypto map. If you want to change the peer, you must first delete the old peer and then specify the new peer.

Use the `no` form of this command to remove an IPSec peer from a crypto map entry.

Command Syntax `set ipv6 peer`

`X:X::X:X no set ipv6 peer`

`X:X::X:X`

Parameters

`X:X::X:X` IPv6 address.

Command Mode

Crypto map configuration mode

Example

```
(config)#crypto map MAP1 5 ipsec-isakmp (config-
crypto)#set ipv6 peer fe80::200:f8ff:fe21:67cf
```

set peer

Use this command to specify an IPSec IPv4 peer in a crypto map entry created by the crypto map (Configure Mode) command.

For `ipsec-isakmp` crypto map entries, you can specify multiple peers by repeating this command. The peer to which packets are actually sent is determined by the last peer from which the router received either traffic or a negotiation request for a given data flow. If the attempt fails with the first peer, IKE tries the next peer on the crypto map list.

For `ipsec-manual` crypto map entries, you can only specify one IPSec peer per crypto map. If you want to change the peer, you must first delete the old peer and then specify the new peer.

Use the `no` form of this command to remove an IPSec peer from a crypto map entry.

Command Syntax `set`

`peer A.B.C.D no set`

`peer A.B.C.D`

Parameters

`A.B.C.D` IPv4 address.

Command Mode

Crypto map configuration mode

Example

```
(config)#crypto map MAP1 5 ipsec-isakmp
(config-crypto)#set peer 1.1.1.1
```

set security-association lifetime

Use this command to override the global lifetime value for a crypto map entry created by the crypto map (Configure Mode) command. The global lifetime value is used when negotiating IPSec security associations.

This command is only available for `ipsec-isakmp` crypto map entries and dynamic crypto map entries.

IPSec security associations use shared secret keys. These keys and their security associations time out together.

Assuming that a crypto map entry has lifetime values configured, when the router requests new security associations during negotiation, it specifies its crypto map lifetime value in the request to the peer. When the router receives a negotiation request from the peer, it uses the smaller of the lifetime value proposed by the peer or the locally configured lifetime value as the lifetime of the new security associations.

Use the `no` form of this command to reset a crypto map entry's lifetime value to the global value.

Command Syntax `set security-association lifetime seconds LIFETIME` `no set security-association lifetime seconds`

Parameters

`LIFETIME`	Duration of a security association before expiring (<120-2592000> seconds)

Defaults

The crypto map's security associations are negotiated according to the global lifetimes.

Command Mode

Crypto map configuration mode

Example

```
(config)#crypto map MAP1 5 ipsec-isakmp (config-
crypto)#set security-association lifetime 20000
```

set session-key

Use this command to define IPSec keys for security associations with `ipsec-manual` crypto map entries created by the crypto map (Configure Mode) command.

If the crypto ipsec transform-set command specifies an AH protocol, an ESP encryption protocol, or an ESP authentication protocol, you must define IPSec keys for both inbound and outbound traffic with this command.

When you define multiple IPSec session keys within a single crypto map, you can assign the same security parameter index (SPI) number to all the keys. The SPI identifies the security association used with the crypto map. You must coordinate SPI assignment with your peer's operator, making certain that the same SPI is not used more than once for the same destination address/protocol combination.

Security associations created with this command do not expire (unlike security associations established via IKE). Session keys at one peer must match the session keys at the remote peer. If you change a session key, the security association using the key is deleted and reinitialized.

For `ipsec-isakmp` crypto map entries, the security associations with their corresponding keys are automatically established via the IKE negotiation.

Use the `no` form of this command to remove a session key from a crypto map entry.

Command Syntax `set session-key (inbound|outbound) ah SPI`

`HEX-KEY-DATA`

`set session-key (inbound|outbound) esp SPI cipher HEX-KEY-DATA authenticator HEX_KEY_DATA no set session-key`

`(inbound|outbound) ah no set session-key`

`(inbound|outbound) esp`

Parameters

`inbound` Inbound IPSec session key.

`outbound` Outbound IPSec session key.

`ah` Session key for the Authentication Header protocol.

`SPI` Security parameter index that uniquely identifies a security association (0-4096).

`HEX-KEY-DATA`

Session key in hexadecimal format. Use an appropriate session key length for the encryption/authentication algorithm:

AES: 128 bits

AES-192: 192 bits

AES-256: 256 bits

3des: 192 bits blf:

32-256 bits cast:

96 or 128 bits

SHA1/MD5: 32-128 bits

`esp` Session key for the Encapsulating Security Payload protocol.

`SPI` Security parameter index that uniquely identifies a security association (0-4096).

`cipher` Encryption key.

`HEX-KEY-DATA`

Encryption key in hexadecimal format (maximum length 128).

`authenticator` Authentication key. `HEX-KEY-DATA`

Authentication key in hexadecimal format (maximum length 32).

Command Mode

Crypto map configuration mode

Example

```
(config)#crypto map MAP2 10 ipsec-manual (config-
crypto)#set session-key inbound ah SPI cipher
```

set transform-set

Use this command to specify the transform sets to use with a crypto map entry created by the crypto map (Configure Mode) command.

For an `ipsec-isakmp` crypto map entry, you can list multiple transform sets with this command. List the higher priority transform sets first. If the local router starts the negotiation, the transform sets are presented to the peer in the order specified in the crypto map entry. If the peer starts the negotiation, the local router accepts the first transform set that matches one of the transform sets specified in the crypto map entry.

The first matching transform set that is found at both peers is used for the security association. If no match is found, IPSec does not establish a security association. The traffic is dropped because there is no security association to protect the traffic.

For an `ipsec-manual` crypto map entry, you can specify only one transform set. If the transform set does not match the transform in the remote peer's crypto map, the two peers fail to communicate because they are using different rules to process the traffic.

To change the list of transform sets, specify a new list of transform sets to replace the old list. This change is only applied to crypto map entries that reference this transform set. The change is not applied to existing security associations, but is used in future negotiations to establish new security associations. If you want the new settings to take effect sooner, clear all or part of the security association database by using the clear crypto sa command.

Any transform sets included in a crypto map must have been defined using the crypto ipsec transform-set command.

Use the `no` form of this command to remove all transform sets from a crypto map entry.

Command

Synta

x `set trans form-set NAME`

`no set trans`

```
form-
set
NAME
```

Parameter

NAME	Name of the crypto map set (maximum length 127).

Command Mode

Crypto map configuration mode

Example

```
(config)#crypto map MAP1 5 ipsec-isakmp
(config-crypto)#set transform-set new
```

show crypto ipsec transform-set

Use this command to display one or all transform sets.

Command Syntax `show crypto ipsec transform-set (NAME|)`

Parameter

NAME	Name of the transform set (maximum length 127)

Command Mode

Exec mode

Example

```
#show crypto ipsec transform-set t1
Transform set t1
  Mode is Tunnel
  Algorithm esp-aes esp-md5
```

show crypto isakmp policy

Use this command to display the parameters for all IKE (Internet Key Exchange) policies.

Command Syntax `show crypto isakmp policy`

Parameters

None

Command Mode

Exec mode

Example

```
#show  crypto  isakmp  policy  Protection
suite priority 1
  encryption algorithm: 3DES - Data Encryption Standard
hash algorithm: Message Digest 5    authentication method:
preshared Key   Diffie-Hellman Group: #14 (modp2048)
lifetime: 15000
psk key: v+NkxY9LLZvwj4qCC2o/gGrWDF2d21jL
peer address: 11.11.11.2
```

show crypto-map interface

Use this command to display the crypto map configuration for an interface.

Command Syntax `show crypto-map interface IFNAME`

Parameter

`IFNAME`	Interface name.

Command Mode

Exec mode

Example

```
#show crypto-map interface p7p1
Interface p7p1
Crypto-map MAP1
Crypto-spi 0
Crypto-access-list-name
Crypto-Transform set t1
Crypto-map peer: 11.11.11.2
```

show ipsec status

Use this command to display the status of IPsec.

Command

Syntax

```
show
ipsec
status
```

Parameter

None

Command Mode

Exec mode

Example

```
#show ipsec status
Security Associations (1 up, 0 connecting):
map1-1[1]: ESTABLISHED 5 minutes ago,
11.11.11.1[11.11.11.1]...11.11.11.2[11.11.11.
2]
       map1-1{6}: INSTALLED, TUNNEL, ESP SPIs: c492556c_i
ccf5790f_o       map1-1{6}: 11.11.11.1/32 === 11.11.11.2/32
       map1-1{6}: INSTALLED, TUNNEL, ESP SPIs: cb43a379_i
cedc90fc_o       map1-1{6}: 11.11.11.1/32 === 11.11.11.2/32
```

Chassis Monitoring Module Command Reference

CHAPTER 1 Chassis Management Module Commands

This chapter provides a description, syntax, and examples of CMM feature commands:

- debug cmm
- locator led
- show hardware-information
- show system-information

You can retrieve the same set of information through SNMP that these commands display. This MIB is defined in `CMMCHASSIS-MIB.txt`:

Symanitron. enterprise identifier	36673
Chassis MIB identifier	100

The MIB definition is available at:

debug cmm

Use this command to enable or disable debugging for CMM.

Command Syntax `debug cmm (enable|disable)`

Parameters

`enable` Enable debugging. `disable` Disable debugging.

Default

By default, debug command is disabled.

Command Mode

Configuration mode and exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#debug cmm enable
(config)#debug cmm disable
```

locator led

Use this command to turn on the locator LED.

Use the no form of this command to turn off the locator LED.

Command Syntax `locator-led on no locator-led`

Parameters

None

Default

By default, locator LED is turned off.

Command Mode

Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#locator-led on
(config)#no locator-led
```

show hardware-information

Use this command to display hardware information.

Command Syntax `show hardware-information (memory|fan|temperature|led|power|transceiver|all)` **Parameter**

`all`	Hardware details of all modules.
`fan`	Fan status of the boards.
`led`	LED status of the boards.
`memory`	Memory information of the boards.
`power`	PSU information.
`temperature`	Temperature sensor information of the boards.
`transceiver`	Transceiver presence status and supported list of transceivers.

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show hardware-information all
-------------------------------------------------------
                RAM INFORMATION
-------------------------------------------------------

```

Table 1-60 explains the show command output fields.

Table 1-60: show hardware-information all output

Entry	Description
Ram Information	Displays the used memory, free memory, shared, buffers, total swap, and free swap memory.
Hard Disk Information	Displays hard drive serial number, model, firmware revision, cylinders, heads, and sectors, as well as revision number and total size.
Fans	Displays the fan tray numbers, numbers of fans per tray, and their speed in RPM.
Board Temp Sensors Temperature	Displays sensor type, current temperature, and operating range.
BCM Chip Internal Temperature	Displays broadcom chips current internal temperature, Operating range and average temperature.
System Power Information	Displays system power Information. Shows Voltage on all rails, and whether the power is up or has failed.
PSU	Show main power supply statistics – Volts in, Volts out, current in and out Amperes, power in and out in Watts, temperature of each power supply, and fan speed in RPM.
LED	Shows a list of what the LEDs represent, what state the LEDs mean, and a description of what the LEDs current color means.

Transceiver DDM support list	Show a list of transceivers that support Digital Diagnostic Monitoring (DDM) – type, vendor name, part number, and whether DDM is supported.
Port Number	Displays a list of the port numbers, port type (SFP,QSFP, etc) and whether a transceiver is or is not in the port.

show system-information

Use this command to display system information.

Command Syntax `show system-information (all|fan|psu|os|cpu|bios|cpu-load|board-info)`

Parameter

`all`	System information of all modules.
`bios`	BIOS information.
`board-info`	Board EEPROM details.
`cpu`	Processor information.
`cpu-load`	CPU load information.
`fan`	Fan Field Replaceable Units (FRU) EEPROM information.
`os`	OS and Kernel version information.
`psu`	Power Supply Field Replaceable Units (FRU) EEPROM information.

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show system-information psu
System PSU FRU Information
==========================
PSU 2 Country of Origin          : CN
PSU 2 PPID Part Number           : 0T9FNW
PSU 2 PPID Part Number Rev       : A00
PSU 2 Manufacturer ID            : 28298
PSU 2 Date Code                  : 52R
PSU 2 Serial Number              : 0298
PSU 2 Part Number                : 0T9FNW
PSU 2 Part Number Revision       : A00
PSU 2 Number of Fans in the tray : 1
PSU 2 Type                       : AC Normal
PSU 2 Service Tag                : AEIOU
```

The following tables explain the show command output fields.

Table 1-61: show system-information topics

Topic	Description
all	Show all topics of system information..
bios	Display BIOS information.
board-info	Display information related to the board.
cpu	Displays Central Processing Unit information
cpu-load	Displays the load on the system's CPU.
fan	Displays fan information contain in the EEPROM.
os	Displays information regarding the host operating system
psu	Displays information regarding Field Replaceable Units (FRU).

Table 1-62: Show fan topic displays

System Fan FRU Information	Description
Fan Tray "#" PPID Part Number	The vendor's part number for the fan.
Fan Tray Serial Number	As stated
Service Tag	The Service Tag can help identify your device for on-line support and upgrading drivers
Vendor Name	As stated

Table 1-63: Show system BIOS information

BIOS Information	Description
# dmidecode	The dmidecode is a tool for dumping a computer's DMI table contents in a humanreadable format. This table contains a description of the system's hardware components, as well as other useful pieces of information such as serial numbers and BIOS revisions.

SMBIOS	The System Management BIOS (SMBIOS) defines data structures (and access methods) that can be used to read management information produced by the BIOS of a computer. Also, it is involved with the DMI Address –
Handle 0x0000, DMI type 0, 24 bytes	Handle of the Desktop Management Interface (DMI) and the DMI type, where type value identifies what the DMI contains. DMI = 0 indicates the following information is specific to BIOS properties, and is 24 bytes long.
BIOS Physical Information	• Vendor – The manufacture of the BIOS. • Version – The Version number. • Release Date – as stated. • Address – starting address (in memory) of the BIOS.

Table 1-63: Show system BIOS information (Continued)

BIOS Information	Description
Characteristics	• Is PCI supported. • Is BIOS upgradeable. • Is boot from a CD supported. • Is selectable boot devices supported. • Is BIOS ROM socketed. • Is Enhanced Disk Drive (EDD) vectoring supported. • Is 5.25"/1.2 MB floppy services supported (int 13h)• Is 3.5"/720 kB floppy services supported (int 13h) • Is 3.5"/2.88 MB floppy services supported (int 13h) • Is Print screen service supported (int 5h) • Is 8042 keyboard services supported (int 9h) • Is Serial services supported (int 14h) • Is Printer services supported (int 17h) • Is Advanced Configuration and Power Interface (ACPI) supported • Is USB legacy supported • Is BIOS boot specification supported • Is Targeted content distribution supported • Is Unified Extensible Firmware Interface (UEFI) supported
BIOS Revision	The BIOS revision number.
Handle 0x0043, DMI type 13, 22 bytes	Handle of the Desktop Management Interface (DMI) and the DMI type, where type value identifies what the DMI contains. DMI = 13 indicates the following information is specific to BIOS language information, and is 22 bytes long.
BIOS Language Informantion	• Language Description Format – A term that describes the number of bits used to represent the BIOS Language information parameters. • Installable Languages – The number of languages that can be used by the BIOS at any time. • Currently Installed Language – United States English (or Latin-1) as described by the ISO standard, en|US|iso8859-1.

Load Information	Description
Load Average for past 15 min	As stated in percent.
CPU Usage at this instant	As stated in percent.
Max threshold for CPU-usage	As stated in percent.

Table 1-64: Show CPU information

System CPU Information	Description
processor	The processor number of each CPU
model name	Details about each CPU. For example, Intel(R) Atom(TM) CPU C2538 @ 2.40GHz.

Table 1-65: Show system CPU load information

Load Information	Description
Uptime	As stated in days, hours, minutes, and seconds.
Load Average for past 1min	As stated in percent.
Load Average for past 5 min	As stated in percent.

Table 1-65: (Continued)Show system CPU load information

Table 1-66: Show system board information

System Information	Description
Product Name	Model number of the device.
Serial Number	As stated
Base MAC Address	As stated
Manufacture Date	As state
Platform Name	The platform on which the product is based.
ONIE Version	The version of the Open Network Install Environment (ONIE).

MAC addresses	Number of MAC addresses related to the device.
Manufacture	As stated
Country Code	The code that represents the country of manufacture. For example, US = United States, TW = Taiwan, and so on.
Diag Version	As stated
CRC-32	Cyclic Redundancy Check value.
Switch Chip Revision	As stated
MAIN BOARD REVISION	As stated
CPU CPLD VERSION	The version of the Complex Programmable Logic Device (CPLD) use by the CPU.
SW CPLD VERSION	The version of the Complex Programmable Logic Device (CPLD) use by the switch.
MAIN BOARD TYPE	An identifying string for the main board.
CPU BOARD ID	An identifying string for the CPU board.
CPU BOARD VERSION	As stated
SW BOARD ID	NA
SW BOARD VERSION	As stated
VCC 5V	The state of the VCC 5V power rail (Enabled \ Disabled)
MAC 1V	The state of the MAC 1V power rail Enabled \ Disabled

Table 1-66: (Continued)Show system board information

System Information	**Description**
VCC 1.8V	The state of the VCC 1.8V power rail (Enabled \ Disabled)
MAC AVS 1V	The state of the MAC AVS 1V power rail (Enabled \ Disabled)
HOT SWAP1	Enabled \ Disabled

HOT SWAP2	Enabled \ Disabled

Table 1-67: Show host system details

Host Information	Description
OS Distribution	The operating system on which the device is to run.
Kernel Version	A string that identifies the operating kernel.

CHAPTER 2 Digital Diagnostic Monitoring Commands

This chapter provides a description, syntax, and examples of DDM feature commands:

- clear ddm transceiver alarm
- ddm monitor
- ddm monitor all
- ddm monitor interval
- ddm monitor interval
- service unsupported-transceiver
- show controller details
- show supported-transceiver
- show interface transceiver details

clear ddm transceiver alarm

Use this command to clear the transceiver alarm in the DDM monitor interface.

Command Syntax `clear ddm transceiver alarm (PORTNUM|)`

Parameters

`PORTNUM` Port number. If this parameter is not specified, this command clears the transceiver alarms for all interfaces.

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear ddm transceiver alarm
```

ddm monitor

Use this command to enable DDM monitoring for interfaces which have a supported transceiver.

Use the `no` form of this command to disable DDM monitoring for all transceivers.

Command Syntax `ddm monitor`

`no ddm monitor`

Parameters

None

Default

By default, DDM monitoring is disabled.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#ddm monitor (config-if)#exit

(config)#interface xe1
(config-if)#no ddm monitor
(config-if)#exit
```

ddm monitor all

Use this command to enable DDM monitoring for all transceiver.s

Use the `no` form of this command to disable DDM monitoring for all transceivers.

Command Syntax `ddm monitor all no ddm monitor all`

Parameters

None

Default

By default, DDM monitoring is disabled.

Command Mode

Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#ddm monitor all

(config)#no ddm monitor all
```

ddm monitor interval

Use this command to set the monitoring interval for the transceiver.

Use no form with this command to set the monitoring interval to its default.

Command Syntax `ddm monitor interval <60-3600> no ddm monitor interval`

Parameters

`<60-3600>`	Interval period in seconds.

Default

The default monitoring interval is 60 seconds.

Command Mode

Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#ddm monitor interval 60
```

debug ddm

Use this command to enable/disable debugging for DDM.

Command Syntax `debug ddm (enable|disable)`

Parameters

`enable`	Enable debugging.
`disable`	Disable debugging.

Default

By default, debug command is disabled.

Command Mode

Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#debug ddm enable
(config)#debug ddm disable
```

service unsupported-transceiver

Use this command to allow an unsupported transceiver to be enabled for DDM monitoring.

Use the `no` form of this command to disable DDM on an unsupported transceiver.

Command Syntax `service unsupported-transceiver`

`no service unsupported-transceiver`

Parameters

None

Default

By default, DDM on an unsupported transceiver is disabled.

Command Mode

Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#service unsupported-transceiver

(config)#no service unsupported-transceiver
```

show controller details

Use this command to display the EEPROM details of transceiver.s

Command Syntax `show interface`

`(IFNAME|) controllers`

Parameters

`IFNAME`	Interface name. If not specified, this command displays details of all connected transceivers.

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show interface xe52/1 controllers

Port Number             : 52
Vendor oui              : 0x0 0x17 0x6a
Vendor name             : AVAGO

```

show supported-transceiver

Use this command to display supported transceivers.

Command Syntax `show supported-transceiver`

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#show supported-transceiver
-----------------------------------------------------
```

```
            Transceiver DDM support list
-----------------------------------------------------
Type                        :SFP
Vendor Name                 :FINISAR CORP
Vendor Part Number          :FTLF8519P2BNL
DDM Supported               :Yes

Type                        :SFP
Vendor Name                 :EVERTZ
Vendor Part Number          :SFP10G-TR13S
DDM Supported               :Yes

Type                        :QSFP
Vendor Name                 :AVAGO
Vendor Part Number          :AFBR-79E4Z
DDM Supported               :Yes
```

show interface transceiver details

Use this command to display details of transceivers and threshold violations.

Command Syntax `show interface (IFNAME|) transceiver (detail|threshold violation|)`

Parameters

`IFNAME`	Interface name. If not specified, this command displays details of all connected transceivers.
`detail`	Transceiver information such as voltage, temperature, power, and current.
`threshold violation`	Transceiver threshold violations.

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show interface transceiver detail

```

Table 2-68 explains the output fields.

Table 2-68: show interface transceiver details output

Field	Description
Port	The number of the transceiver port.
Temp	Temperature in degrees Celsius of the transceiver.
Voltage	Voltage in Volts on the transceiver.
Current	Current in Milliamperes used by the transceiver.
Rx Power	Power received in Decibel-milliwatts (dBm) by the transceiver.
Tx Power	Power being transmitted in milliWatts by the transceiver.
High Alarm	The level that is needed to be reached to trigger a high alarm.
High Warn	The level that is needed to be reached to trigger a high warning.
Low Warn	The level that is needed to be reached to trigger a low warning.
Low Alarm	The level that is needed to be reached to trigger a low alarm.

Layer 2 Configuration Guide

Contents

This guide contains these chapters:

- Chapter 1, *Spanning Tree Protocol Configuration*
- Chapter 2, *RSTP Configuration*
- Chapter 3, *MSTP Configuration*
- Chapter 4, *Disable Spanning Tree Configuration*
- Chapter 5, *RPVST+ Configuration*
- Chapter 6, *VLAN Configuration*
- Chapter 7, *802.1X Configuration*
- Chapter 8, *LACP Configuration*
- Chapter 9, *MC-LAG Configuration*
- Chapter 10, *Traffic Mirroring Configuration*
- Chapter 11, *Maximum MST Instances Configuration*
- Chapter 12, *MC-LAG Configuration*

CHAPTER 1 Spanning Tree Protocol Configuration

This chapter contains a complete sample STP configuration. STP prevents duplication of packets by eliminating loops in the network.

Topology

The following example is a simple multi-bridge topology.

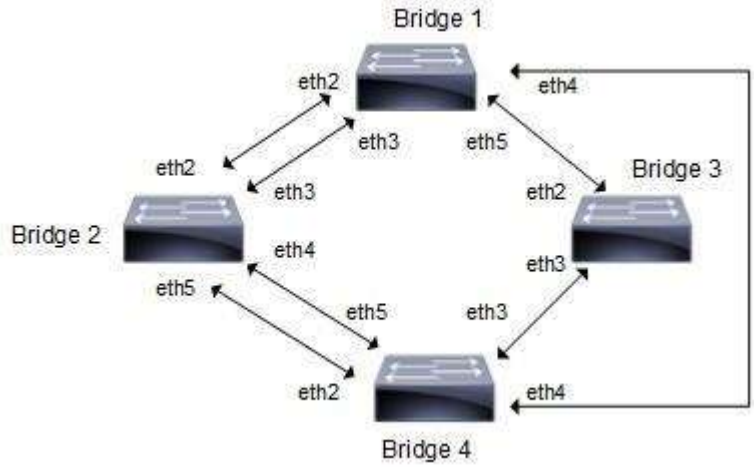

Figure 1-50: STP Topology

Note: Run the `switchport` command on each port to change to Layer-2 mode.

Configurations

Bridge 1

`Bridge1#configure terminal`	Enter configure mode.
`Bridge1(config)#bridge 1 protocol ieee`	Add a bridge `(1)` to the spanning tree table
`Bridge1(config)#interface eth2`	Enter interface mode.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group `1`.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth3`	Enter interface mode.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group `1`.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth4`	Enter interface mode.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group `1`.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth5`	Enter interface mode
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group `1`.

Bridge 2

`Bridge2#configure terminal`	Enter configure mode.
`Bridge2(config)#bridge 2 protocol ieee`	Add a bridge (`2`) to the spanning tree table
`Bridge2(config)#interface eth2`	Enter interface mode.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group `2`.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth3`	Enter interface mode.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group `2`.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth4`	Enter interface mode.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group `2`.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth5`	Enter interface mode
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group `2`.

Bridge 4

`Bridge4#configure terminal`	Enter configure mode.
`Bridge4(config)#bridge 4 protocol ieee`	Add a bridge (`4`) to the spanning tree table
`Bridge4(config)#interface eth2`	Enter interface mode.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group `4`.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth3`	Enter interface mode.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group `4`.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth4`	Enter interface mode.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group `4`.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth5`	Enter interface mode
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group `4`.

Bridge 3

`Bridge3#configure terminal`	Enter configure mode.
`Bridge3(config)#bridge 3 protocol ieee`	Add a bridge `(3)` to the spanning tree table
`Bridge3(config)#interface eth2`	Enter interface mode.
`Bridge3(config-if)#bridge-group 3`	Associate the interface with bridge group `3`.
`Bridge3(config-if)#exit`	Exit interface mode.
`Bridge3(config)#interface eth3`	Enter interface mode.
`Bridge3(config-if)#bridge-group 3`	Associate the interface with bridge group `3`.

CHAPTER 2 RSTP Configuration

This chapter contains a complete sample Rapid Spanning Tree Protocol (RSTP) configuration. RSTP provides rapid convergence of a spanning tree. It speeds up the reconfiguration of the tree after a change by using alternate ports.

Topology

The following example is a simple multi-bridge topology.

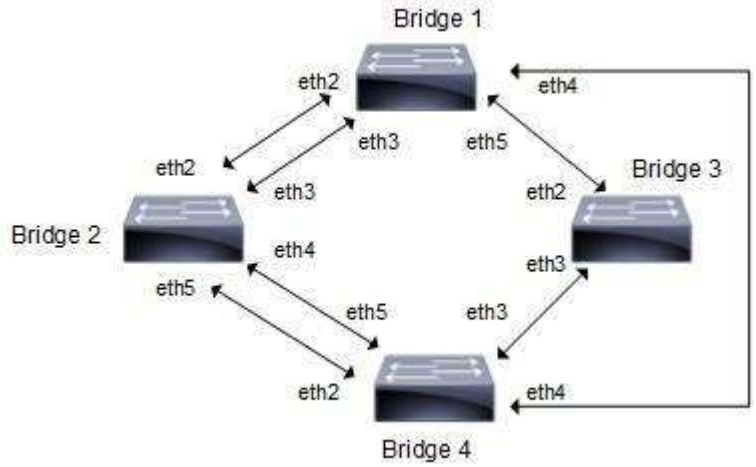

Figure 2-51: RSTP Topology

Note: Run the `switchport` command on each port to change to Layer-2 mode.

Configuration

Bridge 1

`Bridge1#configure terminal`	Enter configure mode.
`Bridge1(config)#bridge 1 protocol rstp`	Add a bridge (`1`) to the rapid spanning tree table
`Bridge1(config)#interface eth2`	Enter interface mode.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth3`	Enter interface mode.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group `1`.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth4`	Enter interface mode.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group `1`.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth5`	Enter interface mode
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group `1`.

Bridge 2

`Bridge2#configure terminal`	Enter configure mode.
`Bridge2(config)#bridge 2 protocol rstp`	Add a bridge (`2`) to the rapid spanning tree table
`Bridge2(config)#interface eth2`	Enter interface mode.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group `2`.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth3`	Enter interface mode.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group `2`.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth4`	Enter interface mode.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group `2`.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth5`	Enter interface mode
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group `2`.

Bridge 3

`Bridge3#configure terminal`	Enter configure mode.
`Bridge3(config)#bridge 3 protocol rstp`	Add a bridge `(3)` to the rapid spanning tree table
`Bridge3(config)#interface eth2`	Enter interface mode.
`Bridge3(config-if)#bridge-group 3`	Associate the interface with bridge group `3`.
`Bridge3(config-if)#exit`	Exit interface mode.
`Bridge3(config)#interface eth3`	Enter interface mode.
`Bridge3(config-if)#bridge-group 3`	Associate the interface with bridge group `3`.

Bridge 4

`Bridge4#configure terminal`	Enter configure mode.
`Bridge4(config)#bridge 4 protocol rstp`	Add a bridge `(4)` to the rapid spanning tree table
`Bridge4(config)#interface eth2`	Enter interface mode.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group `4`.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth3`	Enter interface mode.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group `4`.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth4`	Enter interface mode.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group `4`.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth5`	Enter interface mode
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group `4`.

CHAPTER 3 MSTP Configuration

This chapter contains a complete sample Multiple Spanning Tree Protocol (MSTP) configuration. MSTP allows multiple VLANs to be grouped into one spanning-tree instance. Every MST instance has a spanning-tree that is independent of other spanning-tree instances providing multiple forwarding paths for data traffic.

Topology

This example gives a simple multi-bridge topology and its configuration.

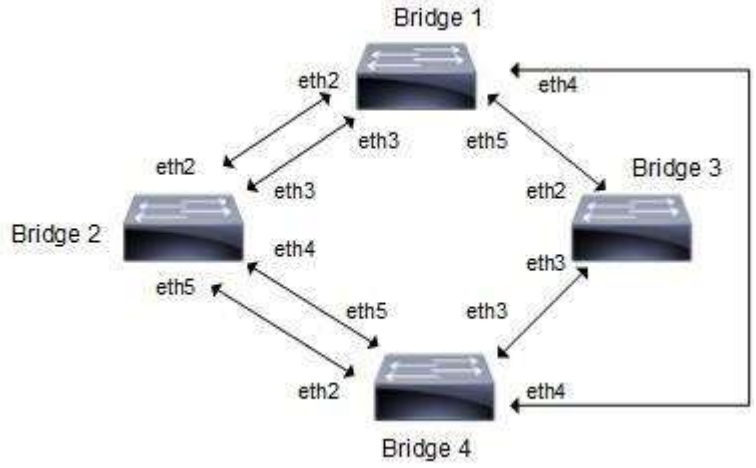

Figure 3-52: MSTP Topology

Note: Run the `switchport` command on each port to change to Layer-2 mode.

Configuration

Bridge 1

`Bridge1#configure terminal`	Enter configure mode.
`Bridge1(config)#bridge 1 protocol mstp`	Add a bridge (1) to the multiple spanning tree table.
`Bridge1(config)#vlan database`	Enter the VLAN configuration mode.
`Bridge1(config-vlan)#vlan 2 bridge 1 state enable`	Enable the state of VLAN 2 on bridge 1. Specifying an enable state allows forwarding of frames over VLAN 2 on bridge 1.
`Bridge1(config-vlan)#vlan 3 bridge 1 state enable`	Enable the state of VLAN 3 on bridge 1. Specifying an enable state allows forwarding of frames over VLAN 3 on bridge 1.
`Bridge1(config-vlan)#vlan 4 bridge 1 state enable`	Enable the state of VLAN 4 on bridge 1. Specifying an enable state allows forwarding of frames over VLAN 4 on bridge 1.
`Bridge1(config-vlan)#vlan 5 bridge 1 state enable`	Enable the state of VLAN 5 on bridge 1. Specifying an enable state allows forwarding of frames over VLAN 5 on bridge 1.
`Bridge1(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge1(config)#spanning-tree mst configuration`	Enter the Multiple Spanning Tree

`Bridge1(config-mst)#bridge 1 instance 2 vlan 2`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge1(config-mst)#bridge 1 instance 3 vlan 3`	Create another instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge1(config-mst)#bridge 1 instance 4 vlan 4`	same as mention above.
`Bridge1(config-mst)#bridge 1 instance 5 vlan 5`	same as mention above.
`Bridge1(config-mst)#exit`	Exit MST Configuration mode.
`Bridge1(config)#interface eth2`	Enter the Interface mode for eth2
`Bridge1(config-if)#bridge-group 1`	Associating the interface to bridge-group 1
`Bridge1(config-if)#bridge-group 1 instance 2`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 3`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 4`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 5`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth3`	Enter the Interface mode for eth3.
`Bridge1(config-if)#bridge-group 1`	Associating the interface to bridge-group 1
`Bridge1(config-if)#bridge-group 1 instance 2`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 3`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 4`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 5`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth4`	Enter the Interface mode for eth4.
`Bridge1(config-if)#bridge-group 1`	Associating the interface to bridge-group 1
`Bridge1(config-if)#bridge-group 1 instance 2`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 3`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 4`	Assigning bridge-group 1 to this instance

`Bridge1(config-if)#bridge-group 1 instance 5`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth5`	Enter the Interface mode for eth5.
`Bridge1(config-if)#bridge-group 1`	Associating the interface to bridge-group 1
`Bridge1(config-if)#bridge-group 1 instance 2`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 3`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 4`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 5`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#exit`	Exit interface mode.

Bridge 2

`Bridge2#configure terminal`	Enter configure mode.
`Bridge2(config)#bridge 2 protocol mstp`	Add a bridge (2) to the multiple spanning
`Bridge2(config)#bridge 2 priority 4096`	Assign priority to this bridge.
`Bridge2(config)#vlan database`	Enter the VLAN configuration mode.
`Bridge2(config-vlan)#vlan 2 bridge 2 state enable`	Enable the state of VLAN 2 on bridge 2. Specifying an enable state allows forwarding of frames over VLAN 2 on bridge 2.
`Bridge2(config-vlan)#vlan 3 bridge 2 state enable`	Enable the state of VLAN 3 on bridge 2. Specifying an enable state allows forwarding of frames over VLAN 3 on bridge 2
`Bridge2(config-vlan)#vlan 4 bridge 2 state enable`	Enable the state of VLAN 4 on bridge 2. Specifying an enable state allows forwarding of frames over VLAN 4 on bridge 2
`Bridge2(config-vlan)#vlan 5 bridge 2 state enable`	Enable the state of VLAN 5 on bridge 2. Specifying an enable state allows forwarding of frames over VLAN 5 on bridge 2
`Bridge2(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge2(config)#spanning-tree mst configuration`	Enter the Multiple Spanning Tree configuration mode
`Bridge2(config-mst)#bridge 2 instance 2 vlan 2`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge2(config-mst)#bridge 2 instance 3 vlan 3`	same as mention above.
`Bridge2(config-mst)#bridge 2 instance 4 vlan 4`	same as mention above.
`Bridge2(config-mst)#bridge 2 instance 5 vlan 5`	same as mention above.
`Bridge2(config-mst)#exit`	Exit MST Configuration mode.
`Bridge2(config)#interface eth2`	Enter the Interface mode for eth2
`Bridge2(config-if)#bridge-group 2`	Associating the interface to bridge-group 2

`Bridge2(config-if)#bridge-group 2 instance 2`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 3`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 4`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 5`	Assigning bridge-group 2 to this instance

`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth3`	Enter the Interface mode for eth3
`Bridge2(config-if)#bridge-group 2`	Associating the interface to bridge-group 2
`Bridge2(config-if)#bridge-group 2 instance 2`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 3`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 3 priority 16`	Assign bridge-group 2 to this instance and set a port priority in order of 16 for it. MSTP uses port priority as a tiebreaker to determine which port should forward frames for a particular instance on a LAN, or which port should be the root port for an instance. A lower value implies better priority.
`Bridge2(config-if)#bridge-group 2 instance 4`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 4 priority 16`	Assign bridge-group 2 to this instance and set a port priority in order of 16 for it. MSTP uses port priority as a tiebreaker to determine which port should forward frames for a particular instance on a LAN, or which port should be the root port for an instance. A lower value implies better priority
`Bridge2(config-if)#bridge-group 2 instance 5`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#exit`	Exit interface mode
`Bridge2(config)#interface eth4`	Enter the Interface mode for eth4
`Bridge2(config-if)#bridge-group 2`	Associating the interface to bridge-group 2
`Bridge2(config-if)#bridge-group 2 instance 2`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 3`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 4`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 5`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth5`	Enter the Interface mode for eth5
`Bridge2(config-if)#bridge-group 2`	Associating the interface to bridge-group 2

`Bridge2(config-if)#bridge-group 2 instance 2`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 3`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 4`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 5`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#exit`	Exit interface mode.

Bridge 3

`Bridge3#configure terminal`	Enter configure mode.
`Bridge3(config)#bridge 3 protocol mstp`	Add a bridge (3) to the multiple spanning tree table
`Bridge3(config)#vlan database`	Enter the VLAN configuration mode.
`Bridge3(config-vlan)#vlan 2 bridge 3 state enable`	Enable the state of VLAN 2 on bridge 3. Specifying an enable state allows forwarding of frames over VLAN 2 on bridge 3.
`Bridge3(config-vlan)#vlan 3 bridge 3 state enable`	Enable the state of VLAN 3 on bridge 3. Specifying an enable state allows forwarding of frames over VLAN 3 on bridge 3.
`Bridge3(config-vlan)#vlan 4 bridge 3 state enable`	Enable the state of VLAN 4 on bridge 3. Specifying an enable state allows forwarding of frames over VLAN 4 on bridge 3.
`Bridge3(config-vlan)#vlan 5 bridge 3 state enable`	Enable the state of VLAN 5 on bridge 3. Specifying an enable state allows forwarding of frames over VLAN 5 on bridge 3.
`Bridge3(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge3(config)#spanning-tree mst configuration`	Enter the Multiple Spanning Tree Configuration mode.
`Bridge3(config-mst)#bridge 3 instance 2 vlan 2`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge3(config-mst)#bridge 3 instance 3 vlan 3`	same as mention above.
`Bridge3(config-mst)#bridge 3 instance 4 vlan 4`	same as mention above.
`Bridge3(config-mst)#bridge 3 instance 5 vlan 5`	same as mention above.
`Bridge3(config-mst)#exit`	Exit MST Configuration mode.
`Bridge3(config)#interface eth2`	Enter the Interface mode for eth2
`Bridge3(config-if)#bridge-group 3`	Associating the interface to bridge-group 3

`Bridge3(config-if)#bridge-group 3 instance 2`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 3`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 4`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 5`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#exit`	Exit interface mode.
`Bridge3(config)#interface eth3`	Enter the Interface mode for eth3
`Bridge3(config-if)#bridge-group 3`	Associating the interface to bridge-group 3
`Bridge3(config-if)#bridge-group 3 instance 2`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 3`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 4`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 5`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#exit`	Exit interface mode.

Bridge 4

`Bridge4#configure terminal`	Enter configure mode.
`Bridge4(config)#bridge 4 protocol mstp`	Add a bridge (4) to the multiple spanning tree table
`Bridge4(config)#vlan database`	Enter the VLAN configuration mode.
`Bridge4(config-vlan)#vlan 2 bridge 4 state enable`	Enable the state of VLAN 2 on bridge 4. Specifying an enable state allows forwarding of frames over VLAN 2 on bridge 4.
`Bridge4(config-vlan)#vlan 3 bridge 4 state enable`	Enable the state of VLAN 3 on bridge 4. Specifying an enable state allows forwarding of frames over VLAN 3 on bridge 4.
`Bridge4(config-vlan)#vlan 4 bridge 4 state enable`	Enable the state of VLAN 4 on bridge 4. Specifying an enable state allows forwarding of frames over VLAN 4 on bridge 4.
`Bridge4(config-vlan)#vlan 5 bridge 4 state enable`	Enable the state of VLAN 5 on bridge 4. Specifying an enable state allows forwarding of frames over VLAN 5 on bridge 4.
`Bridge4(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge4(config)#spanning-tree mst configuration`	Enter the Multiple Spanning Tree Configuration mode.
`Bridge4(config-mst)#bridge 4 instance 2 vlan 2`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge4(config-mst)#bridge 4 instance 3 vlan 3`	same as mention above.
`Bridge4(config-mst)#bridge 4 instance 4 vlan 4`	same as mention above.
`Bridge4(config-mst)#bridge 4 instance 5 vlan 5`	same as mention above.

Bridge4(config-mst)#exit	Exit MST Configuration mode.
Bridge4(config)#interface eth2	Enter the Interface mode for eth2
Bridge4(config-if)#bridge-group 4	Associating the interface to bridge-group 4
Bridge4(config-if)#bridge-group 4 instance 2	Assigning bridge-group 4 to this instance
Bridge4(config-if)#bridge-group 4 instance 3	Assigning bridge-group 4 to this instance
Bridge4(config-if)#bridge-group 4 instance 4	Assigning bridge-group 4 to this instance
Bridge4(config-if)#bridge-group 4 instance 5	Assigning bridge-group 4 to this instance
Bridge4(config-if)#exit	Exit interface mode.
Bridge4(config)#interface eth3	Enter the Interface mode for eth3
Bridge4(config-if)#bridge-group 4	Associating the interface to bridge-group 4
Bridge4(config-if)#bridge-group 4 instance 2	Assigning bridge-group 4 to this instance
Bridge4(config-if)#bridge-group 4 instance 3	Assigning bridge-group 4 to this instance
Bridge4(config-if)#bridge-group 4 instance 4	Assigning bridge-group 4 to this instance
Bridge4(config-if)#bridge-group 4 instance 5	Assigning bridge-group 4 to this instance
Bridge4(config-if)#exit	Exit interface mode.
Bridge4(config)#interface eth4	Enter the Interface mode for eth4
Bridge4(config-if)#bridge-group 4	Associating the interface to bridge-group 4
Bridge4(config-if)#bridge-group 4 instance 2	Assigning bridge-group 4 to this instance
Bridge4(config-if)#bridge-group 4 instance 3	Assigning bridge-group 4 to this instance
Bridge4(config-if)#bridge-group 4 instance 4	Assigning bridge-group 4 to this instance
Bridge4(config-if)#bridge-group 4 instance 5	Assigning bridge-group 4 to this instance
Bridge4(config-if)#exit	Exit interface mode.
Bridge4(config)#interface eth5	Enter the Interface mode for eth5
Bridge4(config-if)#bridge-group 4	Associating the interface to bridge-group 4
Bridge4(config-if)#bridge-group 4 instance 2	Assigning bridge-group 4 to this instance
Bridge4(config-if)#bridge-group 4 instance 3	Assigning bridge-group 4 to this instance
Bridge4(config-if)#bridge-group 4 instance 4	Assigning bridge-group 4 to this instance

Bridge4(config-if)#bridge-group 4 instance 5	Assigning bridge-group 4 to this instance
Bridge4(config-if)#exit	Exit interface mode.

CHAPTER 4 Disable Spanning Tree Configuration

This chapter describes disabling spanning tree operation on a per Multiple Spanning Tree Instance (MSTI) basis.

Topology

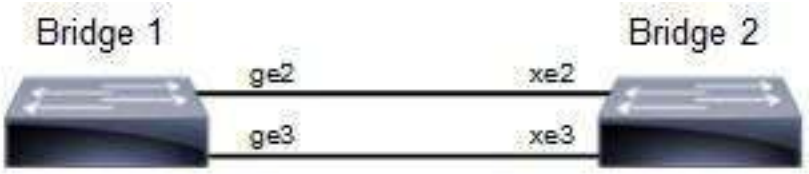

Figure 4-53: Disable Spanning Tree Topology Note:

Run the `switchport` command on each port to change to Layer-2 mode.

Disabling MSTP Configuration

Bridge 1

Disabling MSTP per instance

`Bridge1(config-mst)#no bridge 1 instance 2`	Disable spanning tree for MSTP on instance 2
`Bridge1(config-mst)#no bridge 1 instance 2`	Disable spanning tree for MSTP on instance 3

Disabling MSTP globally

`Bridge1(config)#no bridge 1 multiplespanning-tree enable bridge-forward`	Disable spanning tree globally for MSTP and keeping the ports in forwarding state.

Disabling MSTP per port

`Bridge1(config)#interface ge2`	Enter the Interface mode for ge2.
`Bridge1(config-if)#bridge-group 1 spanningtree disable`	Disable spanning tree per port for MSTP and put port on forwarding state [This command disable any type of STP on the port].

Bridge 2

Disabling MSTP per instance

`Bridge1(config-mst)#no bridge 1 instance 2`	Disable spanning tree for MSTP on instance 2
`Bridge1(config-mst)#no bridge 1 instance 2`	Disable spanning tree for MSTP on instance 3

Disabling MSTP globally

`Bridge1(config)#no bridge 1 multiplespanning-tree`	Disable spanning tree globally for MSTP.

Disabling MSTP per port

`Bridge1(config)#interface xe2`	Enter the Interface mode for xe2.
`Bridge1(config-if)#bridge-group 1 spanningtree disable`	Disable spanning tree per port for MSTP and put port on forwarding state [This command disable any type of STP on the port].

Validation

show spanning-tree mst detail, show spanning-tree mst instance<instance_id>, show spanning-tree **Bridge 1**

Verify MSTP details when applying "`show spanning-tree mst detail`" command

```
#show spanning-tree mst detail

```

- MSTP global configurations
- Verify MSTP configurations when MSTP is enabled globally

```
#show running-config
!
bridge 1 protocol mstp !
```

- Verify MSTP configurations when MSTP is disabled globally

```
#show running-config
! bridge 1 protocol mstp
no bridge 1 multiple-spanning-tree enable bridge-forward !
```

- MSTP per instance configurations
- Verify MSTP configurations when MSTP instance 2 and 3 is enabled.

```
#show running-config spanning-tree
! spanning-tree mst configuration bridge 1 instance 2
bridge 1 instance 2 vlan 2 bridge 1 instance 3 bridge
1 instance 3 vlan 3
! interface xe2 bridge-group 1 instance 2
! interface xe3 bridge-group 1 instance 3 !
```

- Verify MSTP configurations when MSTP instance 2 is disabled

```
#show running-config spanning-tree
! spanning-tree mst configuration bridge 1 instance
3 bridge 1 instance 3 vlan 3
! interface ge3 bridge-group 1 instance 3 !
```

- MSTP interface configurations
- Verify MSTP configurations when spanning-tree is enabled on interface.

```
#show running-config interface ge2
! interface ge2 switchport bridge-group 1
switchport mode access switchport access vlan
2 bridge-group 1 instance 2 !
```

- Verify MSTP configurations when spanning-tree is disabled on interface.

```
#show running-config interface ge2
! interface ge2 switchport
bridge-group 1 spanning-tree disable
switchport mode access switchport
access vlan 2 bridge-group 1
instance 2
```

- Verify MSTP details after disabling spanning-tree on interface ge2 by applying “show spanning-tree mst details” command.

```
#show spanning-tree mst detail

STP Configuration

Bridge 1

Disabling STP globally

`Bridge1(config)#no bridge 1 spanning-tree enable bridge-forward`	Disable spanning tree globally for STP.

Disabling STP per port

`Bridge1(config)#interface ge2`	Enter the Interface mode for ge2.
`Bridge1(config-if)#bridge-group 1 spanningtree disable`	Disable spanning tree per port for STP and put port on forwarding state [This command disable any type of STP on the port]

Bridge 2

Disabling STP globally

`Bridge1(config)#no bridge 1 spanning-tree enable bridge-forward`	Disable spanning tree globally for STP.

Disabling STP per port

`Bridge1(config)#interface xe2`	Enter the Interface mode for xe2.
`Bridge1(config-if)#bridge-group 1 spanningtree disable`	Disable spanning tree per port for STP and put port on forwarding state [This command disable any type of STP on the port]

Validation

show spanning-tree, show spanning-tree <interface name> **Bridge 1**

- Verify STP details when stp is enabled globally and ge2 and ge3 are part of the bridge using “show spanningtree” command.

```
#show spanning-tree

RSTP Configuration

Bridge 1

Disabling RSTP globally

`Bridge1(config)#no bridge 1 rapid-spanningtree enable bridge-forward`	Disable spanning tree globally for RSTP.

Disabling RSTP per port

`Bridge1(config)#interface ge2`	Enter the Interface mode for ge2.
`Bridge1(config-if)#bridge-group 1 spanningtree disable`	Disable spanning tree per port for RSTP and put port on forwarding state [This command disable any type of STP on the port]

Bridge 2

Disabling RSTP globally

`Bridge1(config)#no bridge 1 rapid-spanningtree enable bridge-forward`	Disable spanning tree globally for RSTP.

Disabling RSTP per port

`Bridge1(config)#interface xe2`	Enter the Interface mode for xe2.
`Bridge1(config-if)#bridge-group 1 spanningtree disable`	Disable spanning tree per port for RSTP and put port on forwarding state [This command disable any type of STP on the port]

Validation

show spanning-tree, show spanning-tree <interface name>

Bridge 1

• Verify RSTP details when rstp is enabled globally and ge2 and ge3 are part of the bridge using “show spanningtree” command.

```
#show spanning-tree

CHAPTER 5 RPVST+ Configuration

This chapter contains a complete example of an RPVST+ configuration.

Topology

Figure 5-54: RPVST+ configuration

Configuration

Switch 2

`#configure terminal`	Enter configure mode for the switch.
`(config)#bridge 1 protocol rpvst+`	Configure bridge 1 as an RPVST+ bridge.
`(config)#vlan 2-3 bridge 1`	Configure VLAN 2 and 3 and associate it to bridge 1.
`(config)#spanning-tree rpvst+ configuration`	Enter Rapid Per-VLAN Spanning Tree configuration mode.
`(config-rpvst+)#bridge 1 vlan 2`	Associate a configured VLAN with bridge 1.
`(config-rpvst+)#bridge 1 vlan 3`	Associate a configured VLAN with bridge 1,.
`(config-rvpst+)#exit`	Exit RPVST+ configuration mode.
`(config)#interface eth1`	Enter the interface mode for `eth1`.
`(config-if)#switchport`	Configure `eth1` as a Layer 2 port.
`(config-if)#bridge-group 1`	Associate bridge to interface.
`(config-if)#switchport mode trunk`	Configure port as trunk.
`(config-if)#switchport trunk allowed vlan add 2,3`	Configure VLAN 2 and VLAN 3 on interface.
`(config-if)#bridge-group 1 vlan 2`	Configure bridge group to interface with VLAN 2.
`(config-if)#bridge-group 1 vlan 3`	Configure bridge group to interface with VLAN 3.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode for `eth2`.
`(config-if)#switchport`	Configure `eth2` as a Layer 2 port.
`(config-if)#bridge-group 1`	Associate bridge to interface/
`(config-if)#switchport mode trunk`	Configure port as trunk
`(config-if)#switchport trunk allowed vlan add 2,3`	Configure VLAN 2 and VLAN 3 on interface.
`(config-if)#bridge-group 1 vlan 2`	Configure bridge group to interface with VLAN 2.

(config-if)#bridge-group 1 vlan 3	Configure bridge group to interface with VLAN3.
(config-if)#exit	Exit interface mode.

Switch 1

#configure terminal	Enter configure mode for the switch.
(config)#bridge 1 protocol rpvst+	Configure bridge 1 as an rpvst+ bridge.
(config)#vlan 2-3 bridge 1	Configure VLAN 2 and 3 and associate it to bridge 1.
(config)#interface eth1	Enter the Interface mode for `eth1`.
(config-if)#switchport	Configure `eth1` as a Layer 2 port.
(config-if)#bridge-group 1	Associate bridge to interface.
(config-if)#switchport mode trunk	Configure port as trunk.
(config-if)#switchport trunk allowed vlan add 2,3	Configure VLAN 2 and VLAN 3 on interface.
(config-if)#bridge-group 1 vlan 2	Configure bridge group to interface with VLAN 2.
(config-if)#bridge-group 1 vlan 3	Configure bridge group to interface with VLAN3.
(config-if)#exit	Exit interface mode.

Switch 3

#configure terminal	Enter configure mode for the switch.
(config)#bridge 1 protocol rpvst+	Configure bridge 1 as an rpvst+ bridge
(config)#vlan 2-3 bridge 1	Configure VLAN 2 and 3 and associate it to bridge 1.
(config)#interface eth1	Enter the Interface mode for `eth1`.
(config-if)#switchport	Configure `eth1` as a Layer 2 port.
(config-if)#bridge-group 1	Associate bridge to interface.
(config-if)#switchport mode trunk	Configure port as trunk.
(config-if)#switchport trunk allowed vlan add 2,3	Configure VLAN 2 and VLAN 3 on interface.
(config-if)#exit	Exit interface mode.

CHAPTER 6 VLAN Configuration

This chapter contains a complete VLAN configuration.

Configuring VLAN Tags

Topology

This shows configuring a spanning tree bridge with VLAN tags on forwarding frames. VLAN port access is configured on port `eth2` on bridge 2, port `eth2` and `eth4` on bridge 1 and port `eth4` on bridge 4. Incoming tagged packets to bridge 2 will be forwarded only on these ports configured with VLAN port access.

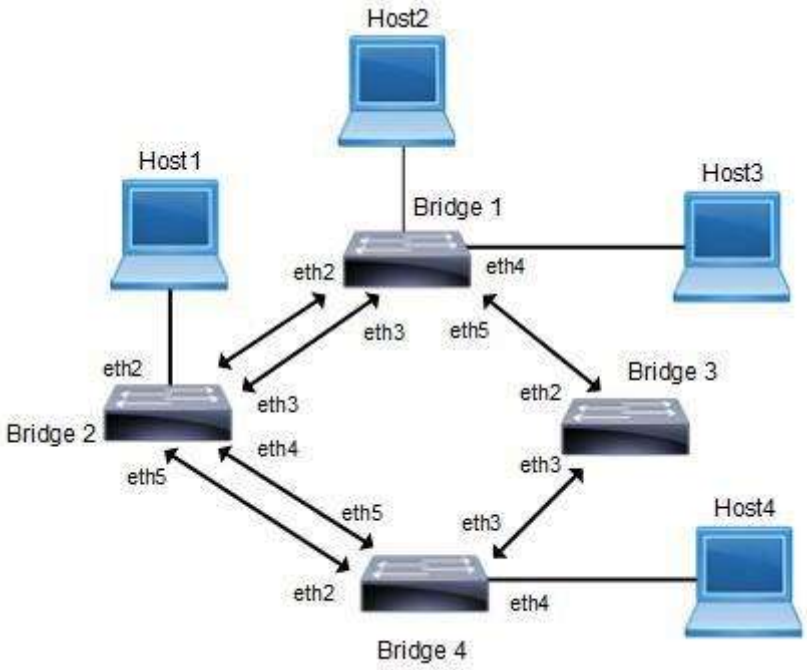

Figure 6-55: VLAN Topology

Note: Run the `switchport` command on each port to change to Layer-2 mode.

Bridge 1

`Bridge1#configure terminal`	Enter configure mode.
`Bridge1(config)#bridge 1 protocol ieee vlanbridge`	Specify VLAN for bridge `1`.
`Bridge1(config)#vlan database`	Enter the `VLAN` configuration mode.
`Bridge1(config-vlan)#vlan 5 bridge 1 state enable`	Enable VLAN `(5)` on bridge `1`. Specifying the `enable` state allows forwarding of frames on this VLAN-aware bridge.
`Bridge1(config-vlan)#exit`	Exit the `VLAN` configuration mode.
`Bridge1(config)#interface eth2`	Enter interface mode.

`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group `1`.
`Bridge1(config-if)#switchport mode access`	Set the switching characteristics of this interface to access mode.
`Bridge1(config-if)#switchport access vlan 5`	Enable VLAN port access by specifying the VLAN ID `5` on this interface.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth3`	Enter interface mode.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group `1`.
`Bridge1(config-if)#switchport mode access`	Set the switching characteristics of this interface to access mode.
`Bridge1(config-if)#switchport access vlan 5`	Enable all VLAN IDs on this port.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth4`	Enter interface mode.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group `1`.
`Bridge1(config-if)#switchport mode access`	Set the switching characteristics of this interface to access mode.
`Bridge1(config-if)#switchport access vlan 5`	Enable VLAN port access by specifying the VLAN ID `5` on this interface.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth5`	Enter interface mode
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group `1`.
`Bridge1(config-if)#switchport mode access`	Set the switching characteristics of this interface to access mode.
`Bridge1(config-if)#switchport access vlan 5`	Enable all VLAN IDs on this port.

Bridge 2

`Bridge2#configure terminal`	Enter configure mode.
`Bridge2(config)#bridge 2 protocol ieee vlanbridge`	Specify VLAN for bridge `2`.
`Bridge2(config)#vlan database`	Enter the `VLAN` configuration mode.
`Bridge2(config-vlan)#vlan 5 bridge 2 state enable`	Enable VLAN `(5)` on bridge `2`. Specifying the `enable` state allows forwarding of frames on this VLAN-aware bridge.
`Bridge2(config-vlan)#exit`	Exit the `VLAN` configuration mode.
`Bridge2(config)#interface eth2`	Enter interface mode.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group `2`.
`Bridge2(config-if)#switchport mode access`	Set the switching characteristics of this interface to access mode.
`Bridge2(config-if)#switchport access vlan 5`	Enable VLAN port access by specifying the VLAN ID `5` on this interface.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth3`	Enter interface mode.

Bridge2(config-if)#bridge-group 2	Associate the interface with bridge group 2.
Bridge2(config-if)#switchport mode access	Set the switching characteristics of this interface to access mode.
Bridge2(config-if)#switchport access vlan 5	Enable all VLAN IDs on this port.
Bridge2(config-if)#exit	Exit interface mode.
Bridge2(config)#interface eth4	Enter interface mode.
Bridge2(config-if)#bridge-group 2	Associate the interface with bridge group 2.
Bridge2(config-if)#switchport mode access	Set the switching characteristics of this interface to access mode.
Bridge2(config-if)#switchport access vlan 5	Enable all VLAN IDs on this port.
Bridge2(config-if)#exit	Exit interface mode.
Bridge2(config)#interface eth5	Enter interface mode
Bridge2(config-if)#bridge-group 2	Associate the interface with bridge group 2.
Bridge2(config-if)#switchport mode access	Set the switching characteristics of this interface to access mode.
Bridge2(config-if)#switchport access vlan 5	Enable all VLAN IDs on this port.

Bridge 4

Bridge4#configure terminal	Enter configure mode.
Bridge4(config)#bridge 4 protocol ieee vlanbridge	Specify VLAN for bridge 4.
Bridge4(config)#vlan database	Enter the VLAN configuration mode.
Bridge4(config-vlan)#vlan 5 bridge 4 state enable	Enable VLAN (5) on bridge 4. Specifying the enable state allows forwarding of frames on this VLAN-aware bridge.
Bridge4(config-vlan)#exit	Exit the VLAN configuration mode.
Bridge4(config)#interface eth2	Enter interface mode.
Bridge4(config-if)#bridge-group 4	Associate the interface with bridge group 4.
Bridge4(config-if)#switchport mode access	Set the switching characteristics of this interface to access mode.
Bridge4(config-if)#switchport access vlan 5	Enable all VLAN IDs on this port.
Bridge4(config-if)#exit	Exit interface mode.
Bridge4(config)#interface eth3	Enter interface mode.
Bridge4(config-if)#bridge-group 4	Associate the interface with bridge group 4.
Bridge4(config-if)#switchport mode access	Set the switching characteristics of this interface to access mode.
Bridge4(config-if)#switchport access vlan 5	Enable all VLAN IDs on this port.
Bridge4(config-if)#exit	Exit interface mode.
Bridge4(config)#interface eth4	Enter interface mode.
Bridge4(config-if)#bridge-group 4	Associate the interface with bridge group 4.

`Bridge4(config-if)#switchport mode access`	Set the switching characteristics of this interface to access mode.
`Bridge4(config-if)#switchport access vlan 5`	Enable VLAN port access by specifying the VLAN ID `5` on this interface.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth5`	Enter interface mode
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group `4`.
`Bridge4(config-if)#switchport mode access`	Set the switching characteristics of this interface to access mode.
`Bridge4(config-if)#switchport access vlan 5`	Enable all VLAN IDs on this port.

Bridge 3

`Bridge3#configure terminal`	Enter configure mode.
`Bridge3(config)#bridge 3 protocol ieee vlanbridge`	Specify VLAN for bridge `3`.
`Bridge3(config)#vlan database`	Enter the `VLAN` configuration mode.
`Bridge3(config-vlan)#vlan 5 bridge 3 state enable`	Enable VLAN `(5)` on bridge `3`. Specifying the `enable` state allows forwarding of frames on this VLAN-aware bridge.
`Bridge3(config-vlan)#exit`	Exit the `VLAN` configuration mode.
`Bridge3(config)#interface eth2`	Enter interface mode.
`Bridge3(config-if)#bridge-group 3`	Associate the interface with bridge group `3`.
`Bridge3(config-if)#switchport mode access`	Set the switching characteristics of this interface to access mode.
`Bridge3(config-if)#switchport access vlan 5`	Enable all VLAN IDs on this port.
`Bridge3(config-if)#exit`	Exit interface mode.
`Bridge3(config)#interface eth3`	Enter interface mode.
`Bridge3(config-if)#bridge-group 3`	Associate the interface with bridge group `3`.
`Bridge3(config-if)#switchport mode access`	Set the switching characteristics of this interface to access mode.
`Bridge3(config-if)#switchport access vlan 5`	Enable all VLAN IDs on this port.

CHAPTER 7 802.1X Configuration

IEEE 802.1x restricts unauthenticated devices from connecting to a switch. Only after authentication is successful, traffic is allowed through the switch.

Topology

In this example, a radius server keeps the client information, validating the identity of the client and updating the switch about the authentication status of the client. The switch is the physical access between the two clients and the server. It requests information from the client, relays information to the server and then back to the client. To configure 802.1x authentication, enable authentication on ports eth1 and eth and specify the radius server IP address and port.

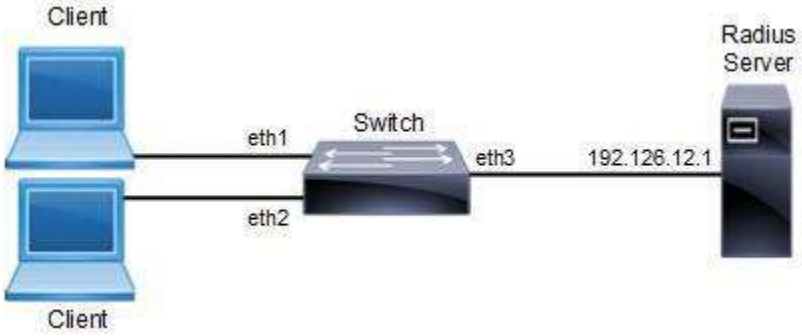

Figure 7-56: 802.1x Topology

Switch Configuration

`Switch#configure terminal`	Enter configure mode.
`Switch(config)#dot1x system-auth-ctrl`	Enable authentication globally.
`Switch(config)#interface eth2`	Enter interface mode.
`Switch(config-if)#dot1x port-control auto`	Enable authentication (via Radius) on port (`eth2`).
`Switch(config-if)#exit`	Exit interface mode.
`Switch(config)#interface eth1`	Enter interface mode.
`Switch(config-if)#dot1x port-control auto`	Enable authentication (via Radius) on port (`eth1`).
`Switch(config-if)#exit`	Exit interface mode.
`Switch(config)#radius-server host 192.126.12.1 auth-port 1812`	Specify the Radius Server address (`192.126.12.1`) and port.
`Switch(config)#radius-server key myKey`	Specify the shared key `myKey` between the radius server and the client.
`Switch(config)#interface eth3`	Enter interface mode.
`Switch(config-if)#ip address 192.126.12.0/24`	Set the IP address on interface `eth3`.

CHAPTER 8 LACP Configuration

This chapter contains a complete sample Link Aggregation Control Protocol (LACP) configuration.

LACP is based on the 802.3ad IEEE specification. It allows bundling of several physical interfaces to form a single logical channel providing enhanced performance and redundancy. The aggregated interface is viewed as a single link to each switch. The spanning tree views it as one interface and not as two or three interfaces. When there is a failure in one physical interface, the other interfaces stay up and there is no disruption. The SWMRE LACP implementation support physical Ethernet links into a single logical channel is depend on Hardware support.

Topology

In this example, 3 links are configured between the two switches S1 and S2. These three links are assigned the same administrative key (1) so that they aggregate to form a single channel 1. They are viewed by the STP as one interface.

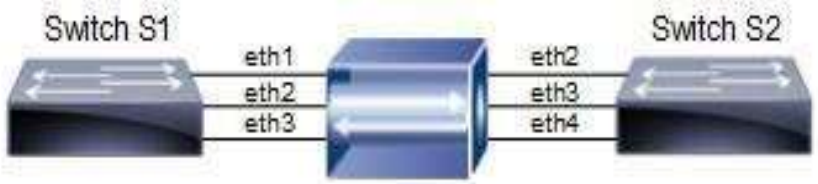

Figure 8-57: LACP Topology

Note: Run the `switchport` command on each port to change to Layer-2 mode.

Configuration

S1

`S1#configure terminal`	Enter configure mode.
`S1(config)#lacp system-priority 20000`	Set the system priority of this switch. This priority is used for determining the system that is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.
`S1(config)#interface eth1`	Enter interface mode.
`S1(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`S1(config-if)#exit`	Exit interface mode.
`S1(config)#interface eth2`	Enter interface mode.
`S1(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`S1(config-if)#exit`	Exit interface mode.

S1(config)#interface eth3	Enter interface mode.
S1(config-if)#channel-group 10 mode active	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.

LACP Configuration

S2

S2#configure terminal	Enter configure mode.
S2(config)#lacp system-priority 20000	Set the system priority of this switch. This priority is used for determining the system that is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.
S2(config)#interface eth2	Enter interface mode.
S2(config-if)#channel-group 10 mode active	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
S2(config-if)#exit	Exit interface mode.
S2(config)#interface eth3	Enter interface mode.
S2(config-if)#channel-group 10 mode active	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
S2(config-if)#exit	Exit interface mode.
S2(config)#interface eth4	Enter interface mode.
S2(config-if)#channel-group 10 mode active	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.

CHAPTER 9 MC-LAG Configuration

This chapter contains a complete example of Multi-Chassis Link Aggregation (MC-LAG) configuration.

MC-LAG (also called DRNI, Distributed Resilient Network Interconnect) expands the concept of link aggregation so that it provides node-level redundancy by allowing two or more nodes to share a common LAG endpoint. It emulates multiple nodes to represent as a single logical node to the remote node running Link aggregation. As a result even if one of the nodes is down there exists a path to reach the destination through the other nodes.

Note: MC-LAG is only compatible with RSTP.

Topology

In the below example Switch 3 and Switch 4 forms a MLAG domain.

As shown in Figure 9-58, switch 3 and switch 4 are a single logical switches to switch 1 and switch 2. Even if either switch 3 or switch 4 is down, there exists a path to reach other destinations.

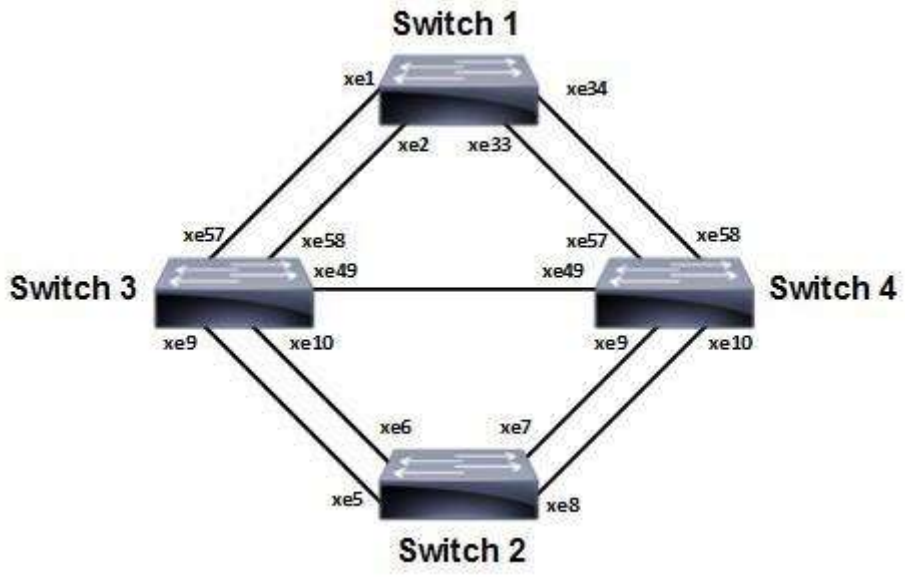

Figure 9-58: MC-LAG Topology

Configuration

Switch 1

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol rstp vlan-bridge`	Create RSTP bridge 1.
`(config)#vlan 2 bridge 1 state enable`	Create VLAN 2.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#switchport`	Configure the interface as Layer 2
`(config-if)#bridge-group 1`	Associate the interface with bridge group 1.

(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe33	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe34	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface po2	Enter interface mode.
(config-if)#exit	Exit interface mode.

Switch 2

#configure terminal	Enter configure mode.

(config)#bridge 1 protocol rstp vlan-bridge	Create RSTP bridge 1.
(config)#vlan 2 bridge 1 state enable	Create VLAN 2.
(config)#interface xe5	Enter interface mode.

(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe6	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe7	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe8	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.

(config-if)#exit	Exit interface mode.
(config)#interface po1	Enter interface mode.
(config-if)#exit	Exit interface mode.

Switch 3

#configure terminal	Enter configure mode.
(config)#bridge 1 protocol rstp vlan-bridge	Create RSTP bridge 1.
(config)#vlan 2 bridge 1 state enable	Create VLAN 2.
(config)#interface xe9	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe57	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe58	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe10	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.

(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 1 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface po1	Enter interface mode.
(config-if)#mlag 1	Enabling Mlag group number
(config-if)#exit	Exit interface mode.
(config)#interface po2	Enter interface mode.
(config-if)#mlag 2	enabling Mlag group number
(config-if)#exit	Exit interface mode.
(config)#mcec domain configuration	Entering MCEC mode
(config-mcec-domain)#domain-address 1111.2222.3333	Domain address for the mlag domain
(config-mcec-domain)#intra-domain link xe49	Intra domain line between mlag domain
(config-mcec-domain)#domain-system-number 1	Number to identify the node in a domain
(config-mcec-domain)#exit	Exit MCEC mode

Switch 4

#configure terminal	Enter configure mode.
(config)#bridge 1 protocol rstp vlan-bridge	Create RSTP bridge 1.
(config)#vlan 2 bridge 1 state enable	Create VLAN 2.
(config)#interface xe9	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe10	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.

(config-if)#channel-group 1 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe57	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe58	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface po1	Enter interface mode.
(config-if)#mlag 1	Enabling Mlag group number
(config-if)#exit	Exit interface mode.
(config)#interface po2	Enter interface mode.
(config-if)#mlag 2	Enabling Mlag group number
(config-if)#exit	Exit interface mode.
(config)#mcec domain configuration	Entering MCEC mode
(config-mcec-domain)#domain-address 1111.2222.3333	Domain address for the Mlag domain
(config-mcec-domain)#intra-domain link xe49	Intra domain Link between Mlag domains
(config-mcec-domain)#domain-system-number 2	Number to identify the node in domain
(config-mcec-domain)#exit	Exit MCEC mode

CHAPTER 10 Traffic Mirroring Configuration

This chapter contains a sample Local and Remote switched port analyzer feature configuration.

SPAN Overview

Switched Port Analyzer (SPAN) refers to selecting network traffic for analysis by a network analyzer. SPAN feature is introduced on switches as the switch forwards traffic that is destined for a MAC address directly to the corresponding port leaving no scope to analyze the traffic.

SPAN monitors the traffic on source port and sends a copy of the traffic to a destination port. The network analyzer, which is attached to the destination port, analyzes the received traffic. Source port can be a single port or multiple ports. A replication of the packets is sent to the destination port for analysis

SPAN is originally referred to port mirroring or port monitoring where all the network traffic on the source port is mirrored to destination port. Port mirroring has three subdivisions.

- Ingress mirroring - Traffic received on the source port will be monitored
- Egress mirroring - Traffic transmitted from the source port will be monitored
- Ingress and egress mirroring - Both received and transmitted traffic on the source port will be monitored. With enhancement to SPAN, mirroring can be classified into three categories

Port Mirroring

In port mirroring, source will be a port which could be a physical interface or a port channel. All the traffic on the source port will be mirrored to destination port. Either traffic received on the source port or traffic transmitted from the source port or both can be monitored.

VLAN Mirroring

In vlan mirroring, source will be a vlan ID and the traffic received on all ports with the vlan ID matching source vlan ID will be mirrored to destination port.

Rule Based Mirroring

In rule based mirroring, there will be a set of matching criteria for the ingress traffic such as matching destination mac address or matching frame type, etc. The traffic matching the rules will be mirrored to the destination port

Topology

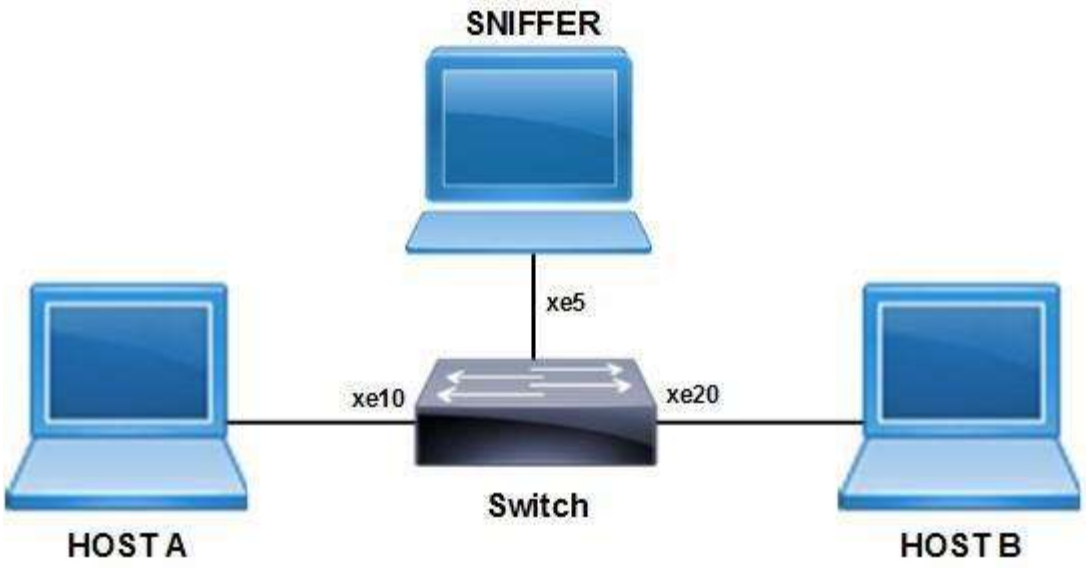

Figure 10-59: SPAN Topology

Port Mirroring Configuration

This example shows detailed configuration of port mirroring.

`#configure terminal`	Enter configure mode.
`(config)# bridge 1 protocol mstp`	Configure bridge 1 as MSTP bridge.
`(config)# vlan 101-110 bridge 1 state enable`	Configure VLANs.
`(config)#interface xe10`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)# bridge-group 1`	Associate bridge to an interface.
`(config-if)# switchport mode trunk`	Configure port as a trunk.
`(config-if)# switchport trunk allowed vlan add 101-110`	Allow VLANs 101-110 on the interface.
`(config-if)# no shutdown`	Make interface admin up.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe20`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)# bridge-group 1`	Associate bridge to an interface.
`(config-if)# switchport mode trunk`	Configure port as a trunk.
`(config-if)# switchport trunk allowed vlan add 101-110`	Allow VLANs 101-110 on the interface.
`(config-if)# no shutdown`	Make interface admin up.
`(config-if)#exit`	Exit interface mode.

(config)#interface xe5	Enter interface mode.
(config-if)# switchport	Configure interface as a layer 2 port.
(config-if)#exit	Exit interface mode.
(config)# monitor session 1	Enter monitor session configuration mode
(config-monitor)# destination interface xe5	Configure the interface as destination port
(config-monitor)# source interface xe10 both	Configure the source interface to mirror ingress as well as egress direction traffic
(config-monitor)# no shut	Activate monitor session
(config-monitor)#end	Exit monitor session configuration mode

Validation

Enter the below commands to confirm the configurations.

```
#show running-config monitor ! monitor session 1  source
interface xe10 both  destination interface xe5  no shut

#show monitor session all    session 1 --------------type
: local state             : up source intf       :     tx
: xe10     rx            : xe10     both          : xe10
source VLANs      :     rx            : destination ports :
xe5 filter count      :

Legend: f = forwarding enabled, l = learning enabled
```

VLAN and Rule Based Mirroring

This example shows detailed configuration of VLAN with rule based mirroring.

#configure terminal	Enter configure mode.
(config)# bridge 1 protocol mstp	Configure bridge 1 as MSTP bridge.
(config)# vlan 101-110 bridge 1 state enable	Configure VLANs
(config)#interface xe10	Enter interface mode.
(config-if)# switchport	Configure interface as a layer 2 port.
(config-if)# bridge-group 1	Associate bridge to an interface.
(config-if)# switchport mode trunk	Configure port as a trunk.
(config-if)# switchport trunk allowed vlan add 101-110	Allow VLANs 101-110 on the interface.
(config-if)# no shutdown	Make interface admin up
(config-if)#exit	Exit interface mode.
(config)#interface xe20	Enter interface mode.
(config-if)# switchport	Configure interface as a layer 2 port.
(config-if)# bridge-group 1	Associate bridge to an interface.

(config-if)# switchport mode trunk	Configure port as a trunk.
(config-if)# switchport trunk allowed vlan add 101-110	Allow VLANs 101-110 on the interface.
(config-if)# no shutdown	Make interface admin up
(config-if)#exit	Exit interface mode.
(config)#interface xe5	Enter interface mode.
(config-if)# switchport	Configure interface as a layer 2 port.
(config-if)#exit	Exit interface mode.
(config)# monitor session 1	Enter monitor session configuration mode
(config-monitor)# destination interface xe5	Configure the interface as destination port
(config-monitor)# source vlan 101	Configure source VLAN to be mirrored
(config-monitor)# filter src-mac host 0000.0000.0005	Configure the rule to match the source MAC
(config-monitor)# no shut	Activate monitor session
(config-monitor)#end	Exit monitor session configuration mode

Validation

Enter the below commands to confirm the configurations.

```
#show running-config monitor ! monitor session 1 source
vlan 101 destination interface xe5 filter src-mac host
0000.0000.0005 no shut
```

```
#show  monitorsession all     session 1 -------------    type                : local state
: up source intf        :     tx              :     rx            :     both          :
source VLANs      :     rx            : 101 destination ports : xe5 filter count      :
1 Legend: f = forwarding enabled, l = learning enabled
```

```
#show monitor session 1 filter    session 1 -------------- filter
count      : 1

--------------    match set 1    ---------------
  source mac address : 0000.0000.0005 (host)
```

RSPAN Overview

When several switches need to be analyzed with a single centralized sniffer, remote switched port analyzer (RSPAN) is used. In RSPAN, all the mirrored traffic will be tagged with a RSPAN VLAN ID and forwarded to remote destination via a port called reflector port. Reflector port will have the same characteristics of a local destination port. RSPAN VLAN ID will be a dedicated VLAN for the monitoring purpose and will not participate in bridging. RSPAN destination switch will strip the RSPAN VLAN tag and send it the sniffer for analysis. RSPAN will have the same sub-categories as SPAN except that the mirrored traffic will be tagged with RSPAN VLAN header and forwarded to destination switch for analysis.

Topology

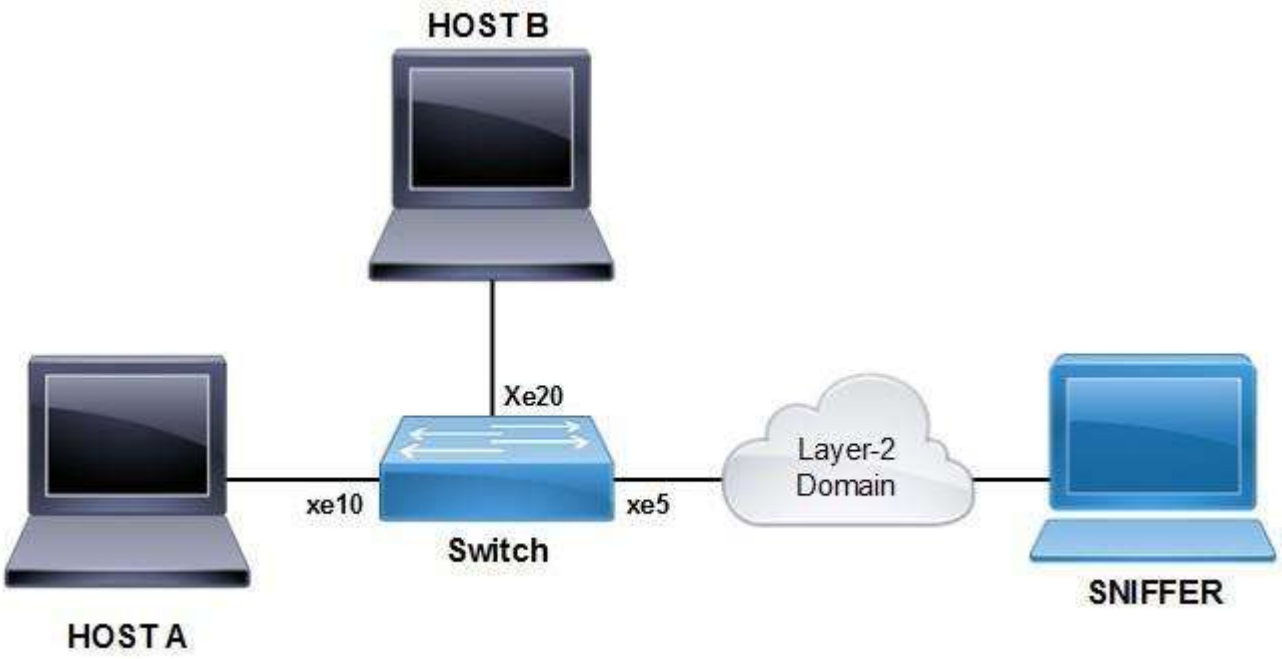

Figure 10-60: RSPAN Topology

Port Mirroring Configuration

This example shows detailed configuration of port mirroring.

`#configure terminal`	Enter configure mode.
`(config)# bridge 1 protocol mstp`	Configure bridge 1 as MSTP bridge.
`(config)# vlan 101-110 bridge 1 state enable`	Configure VLANs.
`(config)#interface xe10`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)# bridge-group 1`	Associate bridge to an interface.
`(config-if)# switchport mode trunk`	Configure port as a trunk.
`(config-if)# switchport trunk allowed vlan add 101-110`	Allow VLANs 101-110 on the interface.
`(config-if)# no shutdown`	Make interface admin up.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe20`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)# bridge-group 1`	Associate bridge to an interface.
`(config-if)# switchport mode trunk`	Configure port as a trunk.

(config-if)# switchport trunk allowed vlan add 101-110	Allow VLANs 101-110 on the interface.
(config-if)# no shutdown	Make interface admin up.
(config-if)#exit	Exit interface mode.
(config)#interface xe5	Enter interface mode.
(config-if)# switchport	Configure interface as a layer 2 port.
(config-if)#exit	Exit interface mode.
(config)# monitor session 1 type remote	Enter monitor session configuration mode.
(config-monitor)# destination remote vlan 100 reflector-port xe5	Configure the interface as remote destination port
(config-monitor)# source interface xe10 both	Configure the source interface to mirror ingress as well as egress direction traffic.
(config-monitor)# no shut	Activate monitor session.
(config-monitor)#end	Exit monitor session configuration mode.

Validation

Enter the commands below to confirm the configurations

```
#show running-config monitor ! monitor session 1 type remote source interface xe10
both destination remote vlan 100 reflector-port xe5 no shut
```

```
#show monitor session all     session 1 ---------------type
: remote state              : up source  intf       :     tx
: xe10     rx            : xe10      both          : xe10 source
VLANs      :     rx             : rspan  VLAN        : 100
reflector ports   : xe5 filter count       :

Legend: f = forwarding enabled, l = learning enabled
```

VLAN and Rule Based Mirroring Configuration

This example shows detailed configuration of VLAN with rule based mirroring.

`#configure terminal`	Enter configure mode.
`(config)# bridge 1 protocol mstp`	Configure bridge 1 as MSTP bridge.
`(config)# vlan 101-110 bridge 1 state enable`	Configure VLANs.
`(config)#interface xe10`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)# bridge-group 1`	Associate bridge to an interface.
`(config-if)# switchport mode trunk`	Configure port as a trunk.
`(config-if)# switchport trunk allowed vlan add 101-110`	Allow VLANs 101-110 on the interface.
`(config-if)# no shutdown`	Make interface admin up.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe20`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)# bridge-group 1`	Associate bridge to an interface.
`(config-if)# switchport mode trunk`	Configure port as a trunk.
`(config-if)# switchport trunk allowed vlan add 101-110`	Allow VLANs 101-110 on the interface.
`(config-if)# no shutdown`	Make interface admin up.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe5`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)#exit`	Exit interface mode.
`(config)# monitor session 1 type remote`	Enter monitor session configuration mode.
`(config-monitor)# destination remote vlan 100 reflector-port xe5`	Configure the interface as remote destination port.
`(config-monitor)# source vlan 101`	Configure source VLAN to be mirrored.
`(config-monitor)# filter src-mac host 0000.0000.0005`	Configure the rule to match the source MAC.
`(config-monitor)# no shut`	Activate monitor session.
`(config-monitor)#end`	Exit monitor session configuration mode.

Validation

Enter the commands below to confirm the configuration.

```
#show running-config monitor !
monitor session 1 type remote  source vlan 101
```

```
 destination remote vlan 100 reflector-port xe5 filter src-mac host
0000.0000.0005 no shut

#show monitor session all     session 1 --------------    type                : remote state

CHAPTER 11 Maximum MST Instances Configuration

This chapter describes the configuration support for extending the maximum number of Multiple Spanning Tree instances from 16 to 64.

Topology

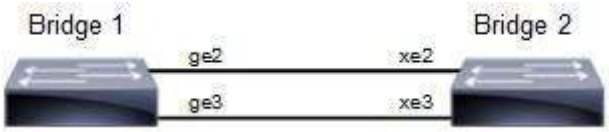

Figure 12-64: Maximum Spanning Tree Topology

Note: This configuration sample assumes that you are running the SWMRE Layer-2 module. If you are using the SWMRE Hybrid Layer-2/Layer-3 module, run the `switchport` command on each port to change to Layer-2 mode.

Configuration

Bridge 1

`Bridge1#configure terminal`	Enter configure mode.
`Bridge1(config)#bridge 1 protocol mstp`	Add `bridge (1)` to the multiple spanning tree table.
`Bridge1(config)#vlan database`	Enter the `VLAN configuration` mode.
`Bridge1(config-vlan)#vlan 2 bridge 1 state enable`	Enable the state of VLAN 2 on bridge 1. This allows forwarding of frames over VLAN 2 on bridge 1.
`Bridge1(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge1(config)#spanning-tree mst configuration`	Enter the Multiple Spanning Tree Configuration mode.
`Bridge1(config-mst)#bridge 1 instance 63 vlan 2`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified, the MSTI is not created.
`Bridge1(config-te-msti)#exit`	Exit `te-msti configuration` mode.
`Bridge1(config)#interface eth1`	Enter the `Interface` mode for `eth1`.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with `bridge-group 1`
`Bridge1(config-if)#switchport mode access`	Set the switching characteristics of this interface to `access` mode.
`Bridge1(config-if)#switchport access vlan 2`	Enable VLAN port access by specifying VLAN ID 2 on this interface.
`Bridge1(config-if)#bridge-group 1 instance 63`	Assign `bridge-group 1` to this instance.

`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth2`	Enter the `Interface` mode for `eth2`
`Bridge1(config-if)#bridge-group 1`	Associate the interface with `bridge-group 1`
`Bridge1(config-if)#switchport mode access`	Set the switching characteristics of this interface to `access` mode.

Maximum MST Instances Configuration

`Bridge1(config-if)#switchport access vlan 2`	Enable VLAN port access by specifying VLAN ID 2 on this interface.
`Bridge1(config-if)#bridge-group 1 instance 63`	Assign `bridge-group 1` to this instance.
`Bridge1(config-if)#exit`	Exit interface mode.

Bridge 2

`Bridge2#configure terminal`	Enter configure mode.
`Bridge2(config)#bridge 1 protocol mstp`	Add `bridge 1` to the multiple spanning tree table.
`Bridge2(config)#vlan database`	Enter the `VLAN configuration` mode.
`Bridge2(config-vlan)#vlan 2 bridge 1 state enable`	Enable the state of VLAN 2 on `bridge 1`. This allows forwarding of frames over `VLAN 2` on `bridge 1`.
`Bridge2(config-vlan)#exit`	Exit the `VLAN configuration` mode.
`Bridge2(config)#spanning-tree mst configuration`	Enter the Multiple Spanning Tree Configuration mode.
`Bridge2(config-mst)#bridge 1 instance 63 vlan 2`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified, the MSTI is not created.
`Bridge2(config-te-msti)#exit`	Exit `te-msti configuration` mode.
`Bridge2(config)#interface eth1`	Enter the `Interface` mode for `eth1`.
`Bridge2(config-if)#bridge-group 1`	Associate the interface with `bridge-group 1`.
`Bridge2(config-if)#switchport mode access`	Set the switching characteristics of this interface to access mode.
`Bridge2(config-if)#switchport access vlan 2`	Enable VLAN port access by specifying the VLAN ID 2 on this interface.
`Bridge2(config-if)#bridge-group 1 instance 63`	Assign `bridge-group 1` to this instance.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth2`	Enter the `Interface` mode for `eth2`.
`Bridge2(config-if)#bridge-group 1`	Associate the interface with `bridge-group 1`.
`Bridge2(config-if)#switchport mode access`	Set the switching characteristics of this interface to `access` mode.
`Bridge2(config-if)#switchport access vlan 2`	Enable VLAN port access by specifying the VLAN ID 2 on this interface.
`Bridge2(config-if)#bridge-group 1 instance 63`	Assign `bridge-group 1` to this instance.

`Bridge2(config-if)#exit`	Exit interface mode.

CHAPTER 12 MC-LAG Configuration

This chapter contains a complete example of Multi-Chassis Link Aggregation (MC-LAG) configuration.

MC-LAG (also called DRNI, Distributed Resilient Network Interconnect) expands the concept of link aggregation so that it provides node-level redundancy by allowing two or more nodes to share a common LAG endpoint. It emulates multiple nodes to represent as a single logical node to the remote node running Link aggregation. As a result even if one of the nodes is down there exists a path to reach the destination via other nodes.

Topology

As shown in Figure 14-66, switch s1 and switch s2 share a common endpoint in switch s3. Switches s1 and s2 are a single logical switch to switch s3. Even if switch s1 or switch s2 is down, there exists a path from switch s3 to reach other destinations.

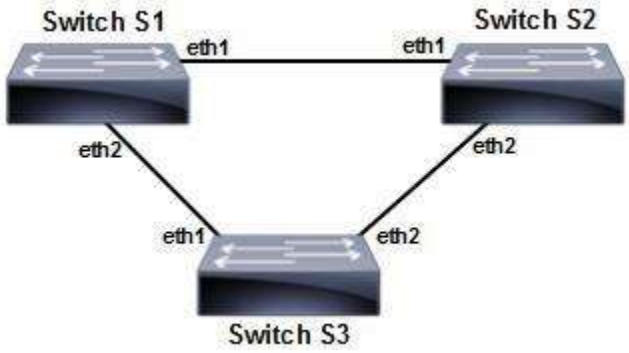

Figure 14-66: MC-LAG Topology

Configuration

S1

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol ieee vlan-bridge`	Create STP bridge 1.
`(config)#vlan 2-100 bridge 1 state enable`	Create VLANs 2 to 100.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#switchport`	Configure the interface as Layer 2
`(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to access mode.
`(config-if)#switchport trunk allowed vlan all`	Enable all VLAN identifiers on this interface.
`(config-if)#channel-group 1 mode active`	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
`(config-if)#exit`	Exit interface mode.

(config)#interface po1	Enter interface mode.
(config-if)#mlag 1	Assign an MLAG-ID to the port channel. One port-channel interface can be bound with an MLAG instance.
(config-if)#exit	Exit interface mode.
(config)#mlag configuration 1	Enters MLAG configuration mode to configure Multi chassis Link aggregation features.
(config-mlag)#portal-system-number 1	Assign the portal system number used to configure portal address, which helps to identify the MLAG domain.
(config-mlag)#portal-name test1	Specify a locally significant name for distributed relay.
(config-mlag)#portal-priority 1	Specify the priority value associated with the portal system.
(config-mlag)#portal-address 0000.0000.0001	Set the portal address, which helps to identify the MLAG domain.
(config-mlag)#portal-topology 2-portal	Set the portal topology.
(config-mlag)#conversation alloc-mode auto	Set5 the conversation allocation mode to automatic.
(config-mlag)#intra-portal-link eth1 neighbor-portal-system 2	Configure the interface that connects two portal systems and a neighbor portal system connected through the IPP.
(config-mlag)#exit	Enter configure mode.

S2

#configure terminal	Enter configure mode.
(config)#bridge 1 protocol ieee vlan-bridge	Create STP bridge 1.
(config)#vlan 2-100 bridge 1 state enable	Create VLANs 2 to 100.
(config)#interface eth2	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2.
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to access mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this port.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface po1	Enter interface mode.
(config-if)#mlag 1	Assigns an MLAG-ID to a port channel. One port-channel interface can be bound with an MLAG instance.
(config-if)#exit	Exit interface mode.
(config)#mlag configuration 1	Enters MLAG configuration mode to configure Multi chassis Link aggregation features.
(config-mlag)#portal-system-number 2	Assigns portal system number used to configure portal address, which helps to identify the MLAG domain
(config-mlag)#portal-name test1	Set a locally significant name for distributed relay.

(config-mlag)#portal-priority 1	Set the priority value associated with the portal system.
(config-mlag)#portal-address 0000.0000.0001	Set the portal address, which helps to identify the MLAG domain.
(config-mlag)#portal-topology 2-portal	Set the portal topology.
(config-mlag)#conversation alloc-mode auto	Set the conversation allocation mode to automatic.
(config-mlag)#intra-portal-link eth1 neighbor-portal-system 1	Configure the interface that connects two portal systems and neighbor portal system connected through the IPP.
(config-mlag)#exit	Enter configure mode.

S3

#configure terminal	Enter configure mode.
(config)#bridge 1 protocol ieee vlan-bridge	Create STP bridge 1.
(config)#vlan 2-100 bridge 1 state enable	Create VLANs 2 to 100.
(config)#interface eth1	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2.
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to access mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this port.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2.
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to access mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this port.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it may be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.

Topology

S1

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol ieee vlan-bridge`	Create STP bridge 1.
`(config)#vlan 2-40 bridge 1 state enable`	Create VLANs 2 to 40.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#switchport`	Configure the interface as Layer 2.
`(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to access mode.

(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this port.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to access mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this port.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it may be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface po1	Enter interface mode.
HOST-1(config-if)#no switchport	Configure the interface as Layer 3.
(config-if)#bridge-group 1	Associate the interface po1 with bridge group 1.
(config-if)#port-conv-id 1 20 port-priority 32768 port-number 7 portal-system 0 priority 1 port-priority 32768 port-number 8 portalsystem 0 priority 2	Configure port conversation identifiers 1 to 20 to the aggregation port which has port 7 and set the priority as 1. Assign the same port conversation identifiers to port 8 with the priority as 2.
(config-if)#port-conv-id 21 40 port-priority 32768 port-number 8 portal-system 0 priority 1 port-priority 32768 port-number 7 portalsystem 0 priority 2	Configure port conversation identifiers 21 to 40 to the aggregation port which has port 8 and set the priority as 1. Assign the same port conversation identifiers to port 7 with the priority as 2.

S2

#configure terminal	Enter configure mode.
(config)#bridge 1 protocol ieee vlan-bridge	Create STP bridge 1.
(config)#vlan 2-40 bridge 1 state enable	Create VLANs 2 to 40.
(config)#interface eth1	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to access mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this port.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.

(config-if)#switchport trunk allowed vlan all	Enable all VLAN IDs on this port.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface po1	Enter interface mode.
HOST-1(config-if)#no switchport	Configure the interface as Layer 3.
(config-if)#bridge-group 1	Associate the interface po1 with bridge group 1.
(config-if)#port-conv-id 1 20 port-priority 32768 port-number 2 portal-system 0 priority 1 port-priority 32768 port-number 3 portalsystem 0 priority 2	Configure port conversation identifiers 1 to 20 to the aggregation port which has port 2 and set the priority as 1. Assign the same port conversation identifiers to port 3 with the priority as 2.
(config-if)#port-conv-id 21 40 port-priority 32768 port-number 3 portal-system 0 priority 1 port-priority 32768 port-number 2 portalsystem 0 priority 2	Configure port conversation identifiers 21 to 40 to the aggregation port which has port 3 and set the priority as 1. Assign the same port conversation identifiers to port 2 with the priority as 2.

CHAPTER 1 Common Commands

This chapter provides a description, the syntax, and examples of common Layer 2 commands.

- flowcontrol
- hardware register get
- hardware register set
- show flowcontrol
- show interface capabilities
- snmp restart mstp

flowcontrol

Use this command to enable or disable flow control.

Flow control enables connected Ethernet ports to control traffic rates during periods of congestion by allowing congested nodes to pause link operations at the other end. If one port experiences congestion and cannot receive any more traffic, it notifies the other port to stop sending until the condition clears. When a local device detects congestion at its end, it notifies the remote device by sending a pause frame. On receiving a pause frame, the remote device stops sending data packets, which prevents loss of data packets during the period of congestion.

Use the `no` parameter with this command to disable flow control.

Command Syntax `flowcontrol`

```
both flowcontrol send
on flowcontrol send off
flowcontrol receive on
flowcontrol receive off
no flowcontrol
```

Parameters `both` Specify flow control mode for sending or receiving.

`send` Specify flow control mode for sending. `receive`

Specify the flow control mode for receiving. `off` Turn off flow control.

`on` Turn on flow control.

Default

The flow control is enabled globally and auto-negotiation is on, flow control is enabled and advertised on 10/100/1000M ports. If auto-negotiation is off or if the port speed was configured manually, flow control is neither negotiated with nor advertised to the peer.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
    #configure terminal
    (config)#interface eth1
    (config-if)#flowcontrol receive off

    #configure terminal
    (config)#interface eth1
    (config-if)#flowcontrol receive on
(config)#interface eth1
(config-if)#no flowcontrol
```

hardware register get

Use this command to get the value of a chip register.

Command Syntax `hardware register get ADDR`

Parameters

`ADDR`	Register address in 0xhhhh format

Default

By default, hello time is 2 seconds

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#hardware register get 0x3000
```

hardware register set

Use this command to set the value of a chip register.

Command Syntax `hardware register set ADDR VALUE`

Parameters

`ADDR`	Register address in 0xhhhh format
`VALUE`	Value

Default

By default, hello time is 2 seconds

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#hardware register set 0x3000 10
```

show flowcontrol

Use this command to display flow control information.

Command Syntax `show flowcontrol`

`show flowcontrol interface IFNAME`

Parameters

`interface IFNAME` Specify the name of the interface to be displayed.

Command Mode

Exec mode and Privileged Exec mode

Applicability

Entry	Description
Port	Interface being checked for flowcontrol.
Send admin	Displays whether the flowcontrol send process is administratively on or off.
FlowControl oper	Displays whether send flowcontrol is on or off on this interface.
Received admin	Displays whether the flowcontrol receive process is administratively on or off.
FlowControl oper	Displays whether receive flowcontrol is on or off on this interface.

RxPause	Number of received pause frames.
TxPause	Number of transmitted pause frames.

This command was introduced before SWMRE version 1.3.

Example

The following is a sample output of the `show flowcontrol interface` command displaying flow control information:

```
#show flowcontrol interface ge1
Port     Send FlowControl     Receive FlowControl RxPause TxPause

admin    oper         admin     oper

-----    ------- --------     ------- --------      ------- ------ge1
on        on            on        on             0       0 #
```

Table 1-69 explains the show command output fields.

Table 1-69: show flow control output

show interface capabilities

Use this command to display interface capabilities

Command Syntax `show interface (IFNAME|) capabilities`

Parameters

`IFNAME`	Displays the name of a specific interface for which status and configuration data is desired.

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show interface xe1/1 capabilities
xe1/1
Speed(FD) : 10MB,100MB,1000MB,10GB,20GB,40GB
Interface : xgmii
Medium : copper
Loopback : none,MAC,PHY
```

```
Pause : pause_tx,pause_rx,pause_asymm
Flags : autoneg
Encap : IEEE,HIGIG,HIGIG2
```

Table 1-70 explains the show command output fields.

Table 1-70: show interface capabilities output details

Field	Description
Interface number	The identifying ID number of the interface – eht0, xe1, etc.
Speed (FD)	The Flexible Data-Rates (FD) of the interface
interface	XAUI is a standard for extending the XGMII (10 Gigabit Media Independent Interface) between the MAC and PHY layer of Gigabit Ethernet.
Medium	Members have to have the same medium type configured. This only applies to Ethernet port-channel. Copper, fiber optics, etc.
Loop back	The loop back between the MAC and PHY layers.
Pause	Pause transmit, pause receive, pause asymmetrically.

Table 1-70: show interface capabilities output details

Field	Description
Flags	Interface flags set for Auto-negotiation.
Encap	Encapsulation – IEEE, HIGIG, and HIGIG2 specifications – HIGIG is a proprietary protocol that is implemented by Broadcom. The HIGIG protocol supports various switching functions. The physical signaling across the interface is XAUI, four differential pairs for receive and transmit (SerDes), each operating at 3.125 Gbit/s.

snmp restart mstp

Use this command to restart SNMP in Multiple Spanning Tree Protocol (MSTP).

Command Syntax `snmp`

```
restart mstp
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#snmp restart mstp
```

CHAPTER 2 Bridge Commands

This chapter provides a description, syntax, and examples of the bridge commands. It includes the following commands:

- bridge acquire
- bridge address
- bridge ageing
- bridge forward-time
- bridge hello-time
- bridge mac-priority-override
- bridge max-age
- bridge max-hops
- bridge priority
- bridge shutdown
- bridge transmit-holdcount
- bridge-group
- bridge-group path-cost
- bridge-group priority
- clear allowed-ethertype
- clear mac address-table
- show allowed-ethertype
- show bridge
- show interface switchport
- show mac address-table count bridge
- show mac address-table bridge
- switchport
- switchport allowed ethertype

bridge acquire

Use this command to enable a bridge to learn station location information for an instance. This helps in making forwarding decisions.

Use the `no` parameter with this command to disable learning.

Command Syntax `bridge <1-32> acquire`

`no bridge <1-32> acquire`

Parameter

<1-32>	Specify the bridge group ID.

Default

By default, learning is enabled for all instances.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#bridge 3 acquire
(config)#no bridge 3 acquire
```

bridge address

Use this command to add a static forwarding table entry for the bridge. Use the no parameter with this command to remove the entry for the bridge

Command Syntax `bridge <1-32> address XXXX.XXXX.XXXX (forward|discard) IFNAME bridge <1-32> address XXXX.XXXX.XXXX (forward|discard) IFNAME vlan <2-4094> bridge <1-32> address XXXX.XXXX.XXXX (forward|discard) IFNAME vlan <2-4094> svlan <2-4094> no bridge <1-32> address XXXX.XXXX.XXXX (forward|discard) IFNAME no bridge <1-32> address XXXX.XXXX.XXXX (forward|discard) IFNAME vlan <2-4094> no bridge <1-32> address XXXX.XXXX.XXXX (forward|discard) IFNAME vlan <2-4094> svlan <2-4094>`

Parameters

<1-32>	Bridge identifier
XXXX.XXXX.XXXX	Media Access Control (MAC) address in HHHH.HHHH.HHHH format.
forward	Forward matching frames.
discard	Discard matching frames.
IFNAME	Interface on which the frame comes out.
vlan	Identity of the VLAN in the range of <2-4094>.
svlan	Identity of the SVLAN in the range of <2-4094>.

Defaul

By default, bridge address is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#bridge 1 address 0000.000a.0021 forward eth0
(config)#no bridge 1 address 0000.000a.0021 forward eth0
```

bridge ageing

Use this command to specify the aging-out time for a learned MAC address. The learned MAC address persists until this specified time.

Use the `no` parameter with this command to disable this command.

Command Syntax `bridge <1-32> ageing-time <10-1000000> bridge <1-32> ageing`

`disable no bridge <1-32> ageing-time`

Parameters

`<1-32>`	Specify the bridge group ID.
`<10-1000000>`	Specify the aging time in seconds.

Default

By default, aging time is 300 seconds

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#bridge 3 ageing-time 1000
(config)#no bridge 3 ageing-time
```

bridge forward-time

Use this command to set the time (in seconds) after which (if this bridge is the root bridge) each port changes states to learning and forwarding. This value is used by all instances.

Use the `no` parameter with this command to restore the default value of 15 seconds.

Command Syntax `bridge <1-32> forward-time <4-30> no bridge <1-32> forward-time`

Parameters

`<1-32>`	Specify the bridge group ID.
`<4-30>`	Specify the forwarding time delay in seconds.

Note: Care should be exercised if the value is to be made below 7 seconds.

Default

By default, value is 15 seconds

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#bridge 3 forward-time 6
(config)#no bridge 3 forward-time
```

bridge hello-time

Use this command to set the hello-time, the time in seconds after which (if this bridge is the root bridge) all the bridges in a bridged LAN exchange Bridge Protocol Data Units (BPDUs). A very low value of this parameter leads to excessive traffic on the network, while a higher value delays the detection of topology change.This value is used by all instances.

Configure the bridge instance name before using this command. The allowable range of values is 1-10 seconds. However, make sure that the value of hello time is always greater than the value of hold time (2 seconds by default).

Use the `no` parameter to restore the default value of the hello time.

Note:A Bridge shall enforce the following relationships for Hello-time, Max-age and Forward-delay.

- 2 × (Bridge_Forward_Delay – 1.0 seconds) >= Bridge_Max_Age
- Bridge_Max_Age >= 2 × (Bridge_Hello_Time + 1.0 seconds)

Command Syntax `bridge <1-32> hello-time <1-10> no bridge <1-32> hello-time`

Parameters

`<1-32>`	Specify the bridge group ID.
`<1-10>`	Specify the hello BPDU interval in seconds.

Default

By default, value is 2 seconds

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 3 hello-time 3

(config)#no bridge 3 hello-time
```

bridge mac-priority-override

Use this command to set a MAC priority override.

Use the `no` parameter with this command to unset a MAC priority override.

Command Syntax

```
bridge <1-32> mac-priority-override mac-address MAC interface IFNAME vlan VLANID
  (static|static-priority-override|static-mgmt|static-mgmt-priority-overide)
  priority <0-7>
no bridge <1-32> mac-priority-override mac-address MAC interface IFNAME vlan VLANID
```

Parameters

`<1-32>`	Specify the bridge group ID.
`mac-address`	Enter a MAC address in HHHH.HHHH.HHHH format.
`interface`	Interface information
`vlan`	Add the values associated with a single VLAN
`static`	The MAC is a static entry
`static-mgmt`	The MAC is a Static Management
`static-mgmt-priority-overide`	The MAC is a Static Management with priority override

`static-priority-override`

The MAC is a static with priority override

`priority`

priority <0-7> priority value

Default

No default address is specified

Command Mode

Configuration Mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 1 mac-priority-override mac-address 1111.1111.1111
interface eth1 vlan 2 static priority 2

(config)#no bridge 1 mac-priority-override mac-address
1111.1111.1111 interface eth1 vlan 2
```

bridge max-age

Use this command to set the maximum age for a bridge. This value is used by all instances.

Maximum age is the maximum time in seconds for which (if a bridge is the root bridge) a message is considered valid. This prevents the frames from looping indefinitely. The value of maximum age should be greater than twice the value of hello time plus 1, but less than twice the value of forward delay minus 1. The allowable range for max-age is 6-40 seconds. Configure this value sufficiently high, so that a frame generated by root can be propagated to the leaf nodes without exceeding the maximum age.

Use the `no` parameter with this command to restore the default value of the maximum age.

Note:A Bridge shall enforce the following relationships for Hello-time, Max-age and Forward-delay.

- 2 × (Bridge_Forward_Delay – 1.0 seconds) >= Bridge_Max_Age
- Bridge_Max_Age >= 2 × (Bridge_Hello_Time + 1.0 seconds)

Command Syntax `bridge <1-32> max-age <6-40> no bridge <1-32> max-age`

Parameters

`<1-32>`	Specify the bridge group ID.
`<6-40>`	Specify the maximum time, in seconds, to listen for the root bridge <6-40>.

Default

By default, bridge maximum age is 20 seconds

Command Mode

Configure Mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 max-age 12

(config)#no bridge 2 max-age
```

bridge max-hops

Use this command to specify the maximum allowed hops for a BPDU in an MST region. This parameter is used by all the instances of the MST. Specifying the maximum hops for a BPDU prevents the messages from looping indefinitely in the network. When a bridge receives an MST BPDU that has exceeded the allowed maximum hops, it discards the BPDU.

Use the `no` parameter with this command to restore the default value.

Command Syntax `bridge <1-32> max-hops <1-40> no bridge <1-32> max-hops`

Parameters

`<1-32>`	Specify the bridge-group ID.
`<1-40>`	Specify the maximum hops for which the BPDU will be valid <1-40>.

Default

By default, maximum hops in an MST region are 20

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 3 max-hops 25

#configure terminal
(config)#no bridge 3 max-hops
```

bridge priority

Use this command to set the bridge priority for the common instance. Using a lower priority indicates a greater likelihood of the bridge becoming root. The priority values can be set only in increments of 4096.

Use the `no` form of the command to reset it to the default value.

Command Syntax `bridge (<1-32> | ) priority <0-61440> no bridge (<1-32> | )priority`

Parameters

`<1-32>`	Specify the bridge group ID.
`<0-61440>`	Specify the bridge priority in the range of <0-61440>.

Default

By default, priority is 32768 (or hex 0x8000).

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 priority 4096

(config)#no bridge 2 priority
```

bridge shutdown

Use this command to disable a bridge.

Use the `no` parameter to reset the bridge.

Command Syntax `bridge shutdown <1-32> bridge shutdown <1-32> bridge-forward no bridge shutdown <1-32>`

Parameters

`<1-32>`	Specify the bridge group ID.	
	`bridge-forward`	Put all ports of the bridge into forwarding state

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#bridge shutdown 4
(config)#no bridge shutdown 4
```

bridge transmit-holdcount

Use this command to set the maximum number of transmissions of BPDUs by the transmit state machine.

Use the `no` parameter with this command to restore the default transmit hold-count value.

Command Syntax `bridge <1-32> transmit-holdcount <1-10> no bridge <1-32> transmit-holdcount`

Parameters

`<1-32>`	Specify the bridge group ID.
`<1-10>`	Transmit hold-count value.

Default

By default, transmit hold-count is 6

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 1 transmit-holdcount 5

(config)#no bridge 1 transmit-holdcount
```

bridge-group

Use this command to bind an interface with a bridge specified by the parameter.

Use the `no` parameter with this command to disable this command.

Command Syntax `bridge-group (<1-32>) no bridge-group (<1-32>)`

Parameters

`<1-32>` Specify the bridge group ID.

Default

By default, bridge-group is disabled

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#bridge-group 2

(config)#interface eth1
(config-if)#no bridge-group 2
```

bridge-group path-cost

Use this command to set the cost of a path associated with a bridge group. The lower the path cost, the greater the likelihood of the bridge becoming root.

Use the `no` parameter with this command to restore the default priority value.

Command Syntax `bridge-group <1-32> path-cost <1-200000000> no bridge-group <1-32> path-cost`

Parameters

`<1-32>` Specify the bridge group ID. `path-cost`

Specify the path-cost of a port.

`<1-200000000>` Specify the cost to be assigned to the group.

Default

By default, bridge-group is disabled

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#bridge-group 3 path-cost 123

(config-if)#no bridge-group 3 path-cost
```

bridge-group priority

Use this command to set the port priority for a bridge. A lower priority indicates a greater likelihood of the bridge becoming root.

Command Syntax `bridge-group <1-32> priority <0-240>` `no bridge-group <1-32> priority`

Parameters

`<1-32>`	Specify the bridge group ID.
`<0-240>`	Specify the port priority range (a lower priority indicates greater likelihood of the interface becoming a root). The priority values can only be set in increments of 16.

Default

By default, priority is 1

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#bridge-group 4 priority 96

(config)#interface eth1
(config-if)#no bridge-group 4 priority
```

clear allowed-ethertype

Use this command to clear statistics for each ethertype per interfaces. `clear allowed-ethertype statistics (IFNAME|)`

Parameters

`IFNAME`	Interface name.

Command Mode

Exec mode

Applicability

This command was introduced in SWMRE version 1.3.1. Example

```
 #clear allowed-ethertype statistics xe54/1

 #show allowed-ethertype statistics xe54/1  Interface xe54/1  arp: 0
Packets, 0 Bytes  ipv4: 0 Packets, 0 Bytes  ipv6: 0 Packets, 0 Bytes
dropped: 0 Packets, 0 Bytes
```

clear mac address-table

Use this command to clear the filtering database for the bridge. This command can be issued to do the following:

- clear the filtering database
- clear all filtering database entries configured through CLI (static)
- clear all multicast filtering database entries
- clear all multicast filtering database entries for a given VLAN or interface
- clear all static or multicast database entries based on a mac address

Command Syntax `clear mac address-table (dynamic|static|multicast) bridge <1-32>`

`clear mac address-table (dynamic|static|multicast) (address MACADDR | interface IFNAME | vlan VID) bridge <1-32> clear mac address-table (dynamic|static|multicast) (address MACADDR | interface IFNAME | vlan VID) (instance INST) bridge <1-32> clear mac address-table (dynamic|static|multicast) cvlan VID svlan VID bridge <1-32>`

Parameters

`dynamic`	Clears all dynamic entries.
`multicast`	Clears all multicast filtering database entries.
`static`	Clears all entries configured through management.
`address`	Clear the specified MAC Address.
`MACADDR`	When filtering database, entries are cleared based on the MAC address.
`bridge`	Clears the bridge group ID. Value range is 1-32.
`bridge`	Clears the bridge group ID. Value range is 1-32.
`cvlan`	Clears all MAC address for the specified CVLAN. Value range is 1-4094.
`svlan`	Clears all mac address for the specified SVLAN. Value range is 1-4094.
`interface`	Clears all MAC address for the specified interface.
`bridge`	Clears the bridge group ID. Value range is 1-32.
`instance`	Clears MSTP instance ID. Value range is <1-63>. `vlan` Clears all MAC address for the specified VLAN. Value range is 1-4094.
`bridge`	Clears the bridge group ID. Value range is 1-32.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

This example shows how to clear all filtering database entries configured through CLI:

```
#clear mac address-table static bridge 1
```

This example shows how to clear multicast filtering database entries:

```
#clear mac address-table multicast bridge 1
```

This example shows how to clear all filtering database entries for a given interface:

```
#clear mac address-table static interface eth0 bridge 1
```

This example shows how to clear multicast filtering database entries for a given VLAN.

```
#clear mac address-table multicast vlan 2 bridge 1
```

This example shows how to clear static filtering database entries for a given MAC address:

```
#clear mac address-table static address 0202.0202.0202 bridge 1
```

This example shows how to clear all filtering database entries learned through bridge operation for a given MAC address.

```
#clear mac address-table dynamic address 0202.0202.0202 bridge 1
```

show allowed-ethertype

Use this command to show allowed and denied traffic statistics.

Note: Dropped slow protocol packets provides the count of slow protocol packets among the total dropped count. Total drop count is fetched from hardware and slow protocol packet count is fetched from software. Hence there can be one or two packet difference.

Command Syntax `show allowed-ethertype statistics (IFNAME|)`

Parameters

`IFNAME` Interface name.

Command Mode

Exec mode

Applicability

This command was introduced in SWMRE version 1.3.1.

Examples

```
#show allowed-ethertype statistics
Interface po1 arp : 0 Packets, 0 Bytes
ipv4 : 511016709 Packets, 184897169366 Bytes
ipv6 : 0 Packets, 0 Bytes dropped : 220
Packets, 28160 Bytes
dropped slow protocol pkts : lacp 220, efm 0, others 0
Interface xe47 arp : 0 Packets, 0 Bytes
ipv4 : 169763534 Packets, 61427990740 Bytes
ipv6 : 0 Packets, 0 Bytes dropped : 0 Packets,
0 Bytes Interface xe48 arp : 0 Packets, 0 Bytes
ipv4 : 0 Packets, 0 Bytes ipv6 : 0 Packets, 0
Bytes dropped : 0 Packets, 0 Bytes
```

show bridge

Use this command to display the filtering database for the bridge. The filtering database is used by a switch to store the MAC addresses that have been learned and which ports that MAC address was learned on.

Command Syntax `show bridge (ieee|rpvst+|mstp|)`

Parameters

`ieee` STP bridges. `rpvst+` RPVST+ bridges. `mstp` MSTP bridges.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show bridge
Ageout time is global and if something is configured for vxlan then it will be affected
here also
 Bridge    CVLAN  SVLAN  BVLAN  Port        MAC Address       FWD   Time-out
 --------+------+------ +------+-----------+-----------------+-----+---------+
 1         1                   eth1        5254.0029.929c    1     0
 1         2                   eth1        5254.004c.dcc6    1     297
 1         1                   eth1        5254.004c.dcc6    1     291
```

Table 2-71 explains the show command output fields.

Table 2-71: show bridge output fields

Field	Description
Bridge	Bridge identifier.
VLAN, SVLAN, BVLAN	CVLAN, SVLAN, and BVLAN identifiers.
Port	Interface name.
MAC Address	Learned MAC address.
FWD	Whether frames for the MAC addresses are forwarded.
Time-out	How long the learned MAC address persists.

show interface switchport

Use this command to display the characteristics of the interface with the current VLAN.

Command Syntax `show interface switchport bridge <1-32>`

Parameter

`bridge` Bridge name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following is an output of this command displaying the characteristics of this interface on bridge 2.

```
#show interface switchport bridge 2
 Interface name          :  eth5
 Switchport mode         : access
 Ingress filter          : disable
 Acceptable frame types  : all
 Vid swap                : disable
 Default vlan            : 2
 Configured vlans        :    2
 Interface name          :  eth4
 Switchport mode         : access
 Ingress filter          : disable
 Acceptable frame types  : all
 Vid swap                : disable
 Default vlan            : 1
 Configured vlans        :    1
```

Table 2-72 explains the show command output fields.

Table 2-72: show interface switchport output fields

Field	Description
Interface name	Display the name of interface.
Switchport mode	Port that used to connect between switches and access port.
Ingress filter	Ingress filtering examines all inbound packets and then permits or denies entry to the network.
Acceptable frame types	Type of acceptable frame in the interface.
VID swap	Displays the status of the VID swap.

Table 2-72: show interface switchport output fields (Continued)

Field	Description
Default vlan	Default value for the VLAN.
Configured vlans	Displays the information on configured VLANs.

show mac address-table count bridge

Use this command to display a count of MAC entries from the filtering database.

Command Syntax

```
show mac address-table (local|remote|) count bridge <1-32> ({(dynamic | multicast |
  static) | address MAC | interface IFNAME | vlan <1-4094> }|)
```

Parameter

`local`	MAC entries learned locally
`remote`	MAC entries learned from MLAG MAC sync
`<1-32>`	Bridge group
`dynamic`	Dynamic entries
`multicast`	Multicast entries
`static`	Static entries
`MAC`	MAC address in HHHH.HHHH.HHHH format
`IFNAME`	Name of the interface
`<1-4094>`	VLAN identifier

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show mac address-table count bridge 1
MAC Entries for all vlans:
Dynamic Address Count: 3
Static (User-defined) Unicast MAC Address Count: 0
Static (User-defined) Multicast MAC Address Count: 0 Total
MAC Addresses in Use: 3
```

Table 2-73 explains the show command output fields.

Table 2-73: show mac address-table count output fields

Field	Description
Dynamic Address Count	Number of dynamic addresses.
Unicast MAC Address Count	Number of unicast addresses.
Multicast MAC Address Count	Number of multicast addresses.

Total MAC Addresses	Total number of addresses.

show mac address-table bridge

Use this command to display MAC entries from the filtering database.

Command Syntax

```
show mac address-table (local|remote|) bridge <1-32> ({(dynamic | multicast |
  static) | address MAC | interface IFNAME | vlan <1-4094> }|)
```

Parameter

local	MAC entries learned locally
remote	MAC entries learned from MLAG MAC sync
<1-32>	Bridge group
dynamic	Dynamic entries
multicast	Multicast entries
static	Static entries
MAC	MAC address in HHHH.HHHH.HHHH format
IFNAME	Name of the interface
<1-4094>	VLAN identifier

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show mac address-table bridge 1 static interface ge14
VLAN      MAC Address    Type      Ports
 ------ +---------------+--------- +---------+--------------
 1       3333.3333.3333  static    ge14

#show mac address-table bridge 1
VLAN      MAC Address    Type      Ports
 ------ +---------------+--------- +---------+--------------
 1       3417.ebf6.0ace  dynamic   po1
 1       6400.6a8e.48ab  dynamic   po1
 1       a82b.b5b5.c37b  dynamic   po1
 200     0000.5e00.0101  dynamic   po1
 200     3417.ebf6.0ac5  dynamic   po1
 200     3417.ebf6.0ace  dynamic   po1
 200     6400.6a8e.48ab  dynamic   po1
 200    a82b.b5b5.c375   dynamic   po1
 200    a82b.b5b5.c37b   dynamic   po1
```

```
                                                                  800
 0000.5e00.0102   dynamic   po1
    800   3417.ebf6.0ac5   dynamic   po1
    800   3417.ebf6.0ace   dynamic   po1
   800    6400.6a8e.48ab   dynamic   po1
   800    a82b.b5b5.c375   dynamic   po1
```

```
800     a82b.b5b5.c37b   dynamic   po1
```

Table 2-74 explains the show command output fields.

Table 2-74: show mac address-table output fields

Field	Description
VLAN	VLAN identifier.
MAC Address	Media Access Control address.
Type	Dynamic, multicast, or static.
Ports	Interface name.

switchport

Use this command to set the mode of an interface to switched.

All interfaces are configured routed by default. To change the behavior of an interface from switched to routed, you must explicitly give the `no switchport` command.

Note: When you change the mode of an interface from switched to routed and vice-versa, all configurations for that interface are erased.

Use the `no` form of this command to set the mode to routed.

Command Syntax

```
switchport
no
switchport
```

Parameters

None

Default

All interfaces are configured routed by default. To change the behavior of an interface from switched to routed, you must explicitly give the no switchport command.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth0 (config-
if)#switchport
```

```
(config)#interface eth0
(config-if)#no switchport
```

switchport allowed ethertype

Use this command to allow a set of ethertype on the access port and deny remaining traffic.

Use the no command to remove ethertype configuration.

Command Syntax `switchport allowed ethertype {arp|ipv4|ipv6|mpls|WORD|log}` `no switchport allowed ethertype ({arp|ipv4|ipv6|mpls|WORD|log}|)`

Parameters

`arp`	Ethertype 0x0806.
`ipv4`	Ethertype 0x0800.
`ipv6`	Ethertype 0x086dd.
`mpls`	Ethertype 0x8847.
`WORD`	Any Ethertype value (0x600 - 0xFFFF).
`log`	Log unwanted ethertype packets.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced in SWMRE version 1.3.1.

Examples

```
#configure terminal
(config)#interface xe1
        (config-if)#switchport allowed ethertype arp ipv4 ipv6 log

(config-if)#no switchport allowed ethertype ipv4
```

CHAPTER 3 Spanning Tree Protocol Commands

This chapter provides a description, syntax, and examples of the Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP) and Multiple Spanning Tree Protocol (MSTP) commands. It includes the following commands:

- bridge cisco-interoperability
- bridge instance
- bridge instance priority
- bridge instance vlan
- bridge multiple-spanning-tree
- bridge protocol ieee
- bridge protocol mstp
- bridge protocol rstp
- bridge rapid-spanning-tree
- bridge region
- bridge revision
- bridge spanning-tree
- bridge spanning-tree errdisable-timeout
- bridge spanning-tree force-version
- bridge spanning-tree pathcost
- bridge spanning-tree portfast
- bridge te-msti
- bridge te-msti vlan
- bridge-group instance
- bridge-group instance path-cost
- bridge-group instance priority
- bridge-group path-cost
- bridge-group priority
- bridge-group spanning-tree
- clear spanning-tree detected protocols
- clear spanning-tree statistics
- customer-spanning-tree customer-edge path-cost
- customer-spanning-tree customer-edge priority
- customer-spanning-tree forward-time
- customer-spanning-tree hello-time
- customer-spanning-tree max-age
- customer-spanning-tree priority
- customer-spanning-tree provider-edge path-cost

- customer-spanning-tree provider-edge priority
- customer-spanning-tree transmit-holdcount
- debug mstp
- show debugging mstp
- show debugging mstp
- show debugging mstp
- show spanning-tree
- show spanning-tree mst
- show spanning-tree statistics
- spanning-tree autoedge
- spanning-tree edgeport
- spanning-tree edgeport
- spanning-tree guard
- spanning-tree instance restricted-role
- spanning-tree instance restricted-tcn
- spanning-tree link-type
- spanning-tree mst configuration
- spanning-tree restricted-domain-role
- spanning-tree restricted-role
- spanning-tree restricted-tcn
- spanning-tree te-msti configuration
- storm-control

bridge cisco-interoperability

Use this command to enable/disable Cisco interoperability for MSTP (Multiple Spanning Tree Protocol).

If Cisco interoperability is required, all SWMRE devices in the switched LAN must be Cisco-interoperability enabled. When SWMRE inter operates with Cisco, the only criteria used to classify a region are the region name and revision level. VLAN-to-instance mapping is not used to classify regions when interoperating with Cisco.

Command Syntax `bridge <1-32> cisco-interoperability (enable | disable)`

Parameters

`<1-32>`	Specify the bridge group ID
`enable`	Enable Cisco interoperability for MSTP bridge
`disable`	Disable Cisco interoperability for MSTP bridge

Default

By default, cisco interoperability is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

To enable Cisco interoperability on a switch for a bridge:

```
#configure terminal
(config)#bridge 2 cisco-interoperability enable
```

To disable Cisco interoperability on a switch for a particular bridge:

```
#configure terminal
(config)#bridge 2 cisco-interoperability disable
```

bridge instance

Use this command to add an MST instance to a bridge.

Use the `no` form of this command to delete an MST instance identifier from a bridge.

Command Syntax `bridge (<1-32> | backbone) instance (<1-63>) no bridge (<1-32> | backbone) instance (<1-63>)`

Parameters

`<1-32>`	Bridge identifier.
`backbone`	Backbone bridge.
`<1-63>`	MST instance identifier.

Default

The bridge instance default is 1.

Command Mode

MST configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 4 protocol mstp
(config)#spanning-tree mst configuration (config-mst)#bridge 4 instance 3
...
(config-mst)#no bridge 4 instance 3
```

bridge instance priority

Use this command to set the bridge instance priority.

Use the `no` form of this command to reset the priority to its default.

Command Syntax `bridge (<1-32> | backbone) instance <1-63> priority <0-61440> no bridge (<1-32> | backbone) instance <1-63> priority`

Parameters

`<1-32>`	Specify the bridge identifier.
`backbone`	Specifies the backbone bridge.
`<1-63>`	Specify the instance identifier.
`priority`	Specify the bridge priority for the instance. The lower the priority of the bridge, the better the chances is of the bridge becoming a root bridge or a designated bridge for the LAN. The priority values can be set only in increments of 4096. The default value is 32768.
`<0-61440>`	Specify the bridge priority.

Default

By default, bridge instance priority is 32768

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
(config)#bridge 4 instance 3 priority 1
```

bridge instance vlan

Use this command to simultaneously add multiple VLANs for the corresponding instance of a bridge.The VLANs must be created before being associated with an MST instance (MSTI). If the VLAN range is not specified, the MSTI will not be created.

Use the `no` form of this command to simultaneously remove multiple VLANs for the corresponding instance of a bridge.

Command Syntax `bridge (<1-32> | backbone) instance (<1-63>) vlan VLANID no bridge (<1-32> | backbone) instance (<1-63>) vlan VLANID`

Parameters

`<1-32>`	Bridge identifier.
`backbone`	Backbone bridge.
`<1-63>`	MST instance identifier.
`VLANID`	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list. For a VLAN range, specify two VLAN identifiers: the lowest and then the highest separated by a hyphen. For a VLAN list, specify the VLAN identifiers separated by commas. Do not enter spaces between the hyphens or commas.

Default

The bridge instance VLAN ID Interfaces default-switch is VLAN100 100 ae0.0 ae1.0 ae2.0.

Command Mode

MST configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

To associate multiple VLANs, in this case VLANs 10 and 20 to instance 1 of bridge 1:

```
#configure terminal
(config)#bridge 1 protocol mstp
(config)#spanning-tree mst configuration
```

```
(config-mst)#bridge 1 instance 1 vlan 10,20
```

To associate multiple VLANs, in this case, VLANs 10, 11, 12, 13, 14, and 15 to instance 1 of bridge 1:

```
#configure terminal
(config)#bridge 1 protocol mstp
(config)#spanning-tree mst configuration
(config-mst)#bridge 1 instance 1 vlan 10-15
```

To delete multiple VLANs, in this case, VLANs 10 and 11 from instance 1 of bridge 1:

```
#configure terminal
(config)#bridge 1 protocol mstp
(config)#spanning-tree mst configuration
(config-mst)#no bridge 1 instance 1 vlan 10,11
```

bridge multiple-spanning-tree

Use this command to enable MSTP on a bridge.

Use the `no` form of this command to disable MSTP on the bridge.

Command Syntax `bridge <1-32> multiple-spanning-tree enable`

`no bridge <1-32> multiple-spanning-tree enable (bridge-forward|)`

Parameters

`<1-32>` Specify the bridge-group ID. `enable` Enables the spanning tree protocol. `bridge-forward` Puts all ports of the specified bridge into forwarding state.

Default

If the bridge-forward option is entered when using the `no` parameter, the default behavior is to put all bridge ports in forwarding state.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 multiple-spanning-tree enable
```

```
#configure terminal
(config)#no bridge 2 multiple-spanning-tree enable bridge-forward
```

bridge protocol ieee

Use this command to add a IEEE 802.1d Spanning Tree Protocol bridge.

After creating a bridge instance, add interfaces to the bridge using the `bridge-group` command. Bring the bridge instance into operation with the `no shutdown` command in interface mode.

Use the `no` parameter with this command to remove the bridge.

Command Syntax `bridge <1-32> protocol ieee`

`(vlan-bridge|) no bridge <1-32>`

Parameters

`<1-32>` Specify the bridge group ID. `vlan-bridge`

Specify this as a VLAN-aware bridge.

Default

The bridge protocol default value is 2 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#bridge 3 protocol ieee

(config)#bridge 4 protocol ieee vlan-bridge
```

bridge protocol mstp

Use this command to create a multiple spanning-tree protocol (MSTP) bridge of a specified parameter. This command creates an instance of the spanning tree and associates the VLANs specified with that instance.

The MSTP bridges can have different spanning-tree topologies for different VLANs inside a region of “similar” MSTP bridges. The multiple spanning tree protocol, like the rapid spanning tree protocol, provides rapid reconfiguration capability, while providing load balancing ability. A bridge created with this command forms its own separate region unless it is added explicitly to a region using the `region name` command.

Use the `no` parameter with this command to remove the bridge.

Command Syntax `bridge <1-32> protocol`

`mstp (ring|) no bridge <1-32>`

Parameters

`<1-32>`	Specify the bridge group ID.
`ring`	(Optional) Enable rapid ring spanning-tree.

Default

The bridge protocol mstp default value is 50 seconds

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 protocol mstp

#configure terminal
(config)#bridge 2 protocol mstp ring
```

bridge protocol rstp

Use this command to add an IEEE 802.1w Rapid Spanning Tree Protocol (RSTP) bridge.

After creating a bridge instance, add interfaces to the bridge using the `bridge-group` command. Bring the bridge instance into operation with the `no shutdown` command in Interface mode.

Use the `no` parameter with this command to remove the bridge.

Command Syntax `bridge <1-32> protocol rstp bridge <1-32> protocol rstp (vlan-bridge|)(ring|) no bridge <1-32>`

Parameters

`<1-32>` Specify the bridge group ID. `ring` (Optional) Add an RSTP bridge for a ring topology. `vlan-bridge` (Optional) Adds a VLAN-aware bridge.

Default

By default, bridge protocol rstp is enabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 protocol rstp
```

```
#configure terminal
(config)#bridge 3 protocol rstp vlan-bridge
```

bridge rapid-spanning-tree

Use this command to enable or disable RSTP on a specific bridge. Use the `bridge-forward` option with the `no` form of the command to place all ports on the specified bridge into the forwarding state. Use the `no` form of the command to disable the Rapid Spanning Tree protocol on a bridge.

Command Syntax `bridge <1-32> rapid-spanning-tree enable`

`no bridge <1-32> rapid-spanning-tree enable (bridge-forward|)`

Parameters

`<1-32>` Specify the bridge group ID.

`enable` Enables the spanning tree protocol. `bridge-forward` (Optional) Puts all ports of the specified bridge into forwarding state.

Default

When the `bridge-forward` option is used with the `no` parameter, the default behavior puts all bridge ports in the forwarding state.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples `configure terminal`

```
(config)#bridge 2 rapid-spanning-tree enable
```

```
 configure terminal
(config)#no bridge 2 rapid-spanning-tree enable bridge-forward
```

bridge region

Use this command to create an MST region and specify its name. MST bridges of a region form different spanning trees for different VLANs.

Use the `no` form of the command to disable the Rapid Spanning Tree protocol on a region.

Command Syntax `bridge <1-32> region REGION_NAME no bridge <1-32> region`

Parameters

`<1-32>` Specify the bridge group ID.

REGION_NAME	Specify the name of the region.

Default

By default, each MST bridge starts with the region name as its bridge address. This means each MST bridge is a region by itself, unless specifically added to one.

Command Mode

MST configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree mst configuration (config-mst)#bridge
3 region myRegion

(config)#spanning-tree mst configuration
(config-mst)#no bridge 3 region
```

bridge revision

Use this command to specify the number for configuration information.

Command Syntax `bridge <1-32> revision <0-65535>`

Parameters

<1-32>	Specify the bridge group ID in the range of <1-32>.
<0-65535>	Specify a revision number in the range of <0-65535>.

Default

By default, revision number is 0

Command Mode

MST configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#spanning-tree mst configuration
(config-mst)#bridge 3 revision 25
```

bridge spanning-tree

Use this command to enable the Spanning Tree Protocol on a bridge.

Use the `no` parameter to disable the Spanning Tree Protocol on the bridge.

Command Syntax `bridge <1-32> spanning-tree enable`

`no bridge <1-32> spanning-tree enable (bridge-forward|)`

Parameters

`<1-32>` Specify the bridge group ID. `enable` Enables the spanning tree protocol on this bridge. `bridge-forward` Puts all ports of the specified bridge into the forwarding state.

Default

If the bridge-forward option is entered when using the `no` parameter, the default behavior is to put all bridge ports in forwarding state.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 spanning-tree enable

#configure terminal
(config)#no bridge 2 spanning-tree enable bridge-forward
```

bridge spanning-tree errdisable-timeout

Use this command to enable the error-disable-timeout facility, which sets a timeout for ports that are disabled due to the BPDU guard feature.

The BPDU guard feature shuts down the port on receiving a BPDU on a BPDU-guard enabled port. This command associates a timer with the feature such that the port gets enabled back without manual intervention after a set interval.

Use the `no` parameter to disable the error-disable-timeout facility.

Command Syntax `bridge <1-32> spanning-tree errdisable-timeout enable`

`bridge <1-32> spanning-tree errdisable-timeout interval <10-1000000> no bridge <1-32> spanning-tree errdisable-timeout enable`

`no bridge <1-32> spanning-tree errdisable-timeout interval`

Parameters

`<1-32>`	Specify the bridge group ID.
`enable`	Enable the timeout mechanism for the port to be enabled back
`interval`	Specify the interval after which port shall be enabled.

`<10-1000000>`

Specify the error-disable-timeout interval in seconds.

Default

By default, the port is enabled after 300 seconds

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 1 spanning-tree errdisable-timeout enable

#configure terminal
(config)#bridge 4 spanning-tree errdisable-timeout interval 34
```

bridge spanning-tree force-version

Use this command to set the version for the bridge. A version identifier of less than a value of 2 enforces the spanning tree protocol. Although the command supports an input range of 0-4, for RSTP, the valid range is 0-2. When the forceversion is set for a bridge, all ports of the bridge have the same spanning tree version set.

Use the `show spanning tree` command to display administratively configured and currently running values of the BPDU filter parameter for the bridge and port (see show spanning-tree).

Use the no parameter with this command to disable the version for the bridge.

Command Syntax `bridge <1-32> spanning-tree force-version <0-4> no bridge <1-32> spanning-tree force-version`

Parameters

`<1-32>` Specify the bridge group ID. `force-version`

Specify a force version identifier:

`0`	STP
`1`	Not supported
`2`	RSTP
`3`	MSTP

Default

By default, spanning tree force version is 0

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

Set the value to enforce the spanning tree protocol:

```
#configure terminal
(config)#bridge 1 spanning-tree force-version 0

(config)#no bridge 1 spanning-tree force-version
```

bridge spanning-tree pathcost

Use this command to set a spanning-tree path cost method.

If the short parameter is used, the switch uses a value for the default path cost a number in the range 1 through 65,535.
If the long parameter is used, the switch uses a value for the default path cost a number in the range 1 through 200,000,000. Refer to the show spanning-tree to view the administratively configured and current running pathcost method running on a bridge.

Use the no option with this command to return the path cost method to the default setting.

Command Syntax `bridge <1-32> spanning-tree pathcost method`

`(short|long) no bridge <1-32> spanning-tree pathcost method`

Parameters

`<1-32>`	Specify the bridge group ID.
`method`	Method used to calculate default port path cost.
`long`	Use 16-bit based values for default port path costs.
`short`	Use 32-bit based values for default port path costs.

Default

By default, path cost method for STP is short and for MSTP/RSTP is long.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bridge 1 spanning-tree pathcost method short

(config)#no bridge 1 spanning-tree pathcost method
```

bridge spanning-tree portfast

Use this command to set the portfast BPDU (Bridge Protocol Data Unit) guard or filter for the bridge.

Use the `show spanning tree` command to display administratively configured and currently running values of the BPDU filter parameter for the bridge and port (see show spanning-tree).

Use the `no` parameter with this command to disable the BPDU filter for the bridge.

BPDU Filter

All ports that have their BPDU filter set to default take the same value of BPDU filter as that of the bridge. The Spanning Tree Protocol sends BPDUs from all ports. Enabling the BPDU Filter feature ensures that PortFast-enabled ports do not transmit or receive any BPDUs.

BPDU Guard

When the BPDU guard feature is set for a bridge, all portfast-enabled ports of the bridge that have the BPDU guard set to default shut down the port on receiving a BPDU. In this case, the BPDU is not processed. You can either bring the port back up manually by using the `no shutdown` command, or configure the errdisable-timeout feature to enable the port after the specified time interval.

Command Syntax `bridge <1-32> spanning-tree portfast bpdu-guard` `bridge <1-32> spanning-tree portfast bpdu-filter` `no bridge <1-32> spanning-tree portfast bpdu-guard` `no bridge <1-32> spanning-tree portfast bpdu-filter`

Parameters

`<1-32>` Specify the bridge group ID. `bpdu-filter` Specify to filter the BPDUs on portfast enabled ports. `bpdu-guard` Specify to guard the portfast ports against BPDU receive.

Default

By default, portfast for STP is enabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#bridge 3 spanning-tree portfast bpdu-filter

#configure terminal
(config)#bridge 1 spanning-tree portfast bpdu-guard
```

bridge te-msti

Use this command to enable or disable a Multiple Spanning Tree Instance (MSTI).

The te-msti always refers to the MST instance indexed by the pre-defined macro constant MSTP_TE_MSTID internally. This is the only MST instance which supports the disabling of spanning trees.

Use the no form of this command to remove the configuration.

Command Syntax bridge (<1-32> | backbone) te-msti no bridge (<1-32> | backbone) te-msti

Parameters

<1-32>	Specify the bridge group ID.
backbone	Identity of the backbone bridge group.
te-msti	MSTI to be the traffic engineering MSTI instance.

Default

By default, bridge te-msti is disabled

Command Mode

TE-MSTI Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree te-msti configuration
(config-te-msti)#bridge 2 te-msti

(config-te-msti)#no bridge 2 te-msti
```

bridge te-msti vlan

Use this command to enable or disable a Multiple Spanning Tree Instance (MSTI). When an MSTI is shutdown (disabled) each VLAN in the MSTI is set to the forwarding state on all bridge ports which the VLAN as a member of. When and MSTI is enabled (no shutdown), normal MSTP operation is started for the MSTI.

The te-msti always refers to the MST instance indexed by the pre-defined macro constant MSTP_TE_MSTID internally. This is the only MST instance which supports the disabling of spanning trees. All VLANs that do not want spanning tree topology computation need to be assigned to this te-msti instance.

This command is intended for supporting Traffic Engineering (TE) Ethernet tunnels. All VLANs allocated for traffic engineering should be assigned to one MSTI. That MSTI can in turn shutdown the spanning tree operation so that each VLAN path through the network can be manually provisioned.

Use the no form of this command to remove the configuration.

Command Syntax `bridge (<1-32> | backbone) te-msti vlan <1-4094>` `no bridge (<1-32> | backbone) te-msti vlan <1-4094>`

Parameters

`<1-32>` Specify the bridge group ID. `backbone` Identity of the backbone bridge group. `vlan` Specify a VLAN.

`<1-4094>` Specify a VLAN identifier to be associated.

Note: This designated instance is defined in 802.1Qay clause 8.9 to be 0xFFE.

Default

By default, te-msti vlan is vlan1.

Command Mode

TE-MSTI Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree te-msti configuration
(config-te-msti)#bridge 2 te-msti vlan 10
(config-te-msti)#no bridge 2 te-msti vlan 10
```

bridge-group instance

Use this command to assign a Multiple Spanning Tree (MST) instance to a port.

Use the `no` form of this command to remove the interface from the MST instance.

Command Syntax `bridge-group (<1-32> | backbone) instance (<1-63> | te-msti)` `no bridge-group (<1-32> | backbone) instance (<1-63> | te-msti)`

Parameters

`<1-32>`	Bridge identifier.
`backbone`	Backbone bridge.
`<1-63>`	Multiple spanning tree instance identifier.
`te-msti`	Traffic engineering MSTI instance.

For Provider Backbone Bridging (PBB), bridge-group <1-32> refers to the I-component or PB bridge while the <backbone> bridge group refers to the B-component. Usually for a BEB (Backbone Edge Bridge) device, the backbone bridge-group is used for traffic engineering.

For a PB (Provider Bridge) device used as BCB (Backbone Core Bridge), bridge group <132> is used for traffic engineering.

Default

By default, the bridge port remains in the listening and learning states for 15 seconds before transitional to the forwarding state.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#bridge-group 1
(config-if)#bridge-group 1 instance te-msti
```

bridge-group instance path-cost

Use this command to set a path cost for a multiple spanning tree instance.

Before you can give this command, you must explicitly add an MST instance to a port using the `bridge-group instance` command.

Use the `no` form of this command to set the path cost to its default which varies depending on bandwidth.

Command Syntax `bridge-group (<1-32> | backbone) instance <1-63> path-cost <1-200000000> no bridge-group ( <1-32> | backbone) instance <1-63> path-cost`

Parameters

`<1-32>` Bridge identifier. `backbone`

Specify the backbone bridge.

`<1-63>` Set the MST instance identifier.

`<1-200000000>` Path cost for a port (a lower path cost means greater likelihood of becoming root).

Default

Assuming a 10 Mb/s link speed, the default value is 200,000.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#spanning-tree mst configuration
(config-mst)#bridge 4 instance 3 vlan 3
(config-mst)#exit
(config)#interface eth1
(config-if)#bridge-group 4 instance 3
(config-if)#bridge-group 4 instance 3 path-cost 1000
```

bridge-group instance priority

Use this command to set the priority of a multiple spanning tree instance.

The Multiple Spanning Tree Protocol uses port priority as a tiebreaker to determine which port should forward frames for a particular instance on a LAN, or which port should be the root port for an instance. A lower value implies a better priority. In the case of the same priority, the interface index will serve as the tiebreaker, with the lower-numbered interface being preferred over others.

Command Syntax `bridge-group (<1-32>) instance (<1-63>) priority <0-240> no bridge-group (<1-32>) instance (<1-63>) priority`

Parameters

`<1-32>`	Bridge identifier.
`backbone`	Backbone bridge.
`<1-63>`	Multiple spanning tree instance identifier.
`<0-240>`	Port priority. A lower value means greater likelihood of becoming root. Set the port priority in increments of 16.

Default

By default, the port priority is 128

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
(config)#interface eth2
(config-if)#bridge-group 2
(config-if)#bridge-group 2 instance 4
(config-if)#bridge-group 2 instance 4 priority 64
```

bridge-group path-cost

Use this command to set the cost of a path. Before you can use this command to set a path-cost in a VLAN configuration, you must explicitly add an MST instance to a port using the `bridge-group instance` command.

Use the `no` parameter with this command to restore the default cost value of the path which varies depending on the bandwidth.

Command Syntax `bridge-group <1-32> path-cost <1-200000000> no bridge-group <1-32> path-cost`

Parameters

`<1-32>`	Specify the bridge group ID.
`path-cost`	Specify the cost of path for a port.
`<1-200000000>`	Specify the cost of the path (a lower cost means a greater likelihood of the interface becoming root).

Default

Assuming a 10 Mb/s link speed, the default value is 200,000.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree mst configuration
(config-mst)#bridge 4 instance 3 vlan 3
(config-mst)#exit
(config)#interface eth1
(config-if)#bridge-group 4
(config-if)#bridge-group 4 path-cost 1000
```

bridge-group priority

Use this command to set the port priority for a bridge group.

The Multiple Spanning Tree Protocol uses port priority as a tiebreaker to determine which port should forward frames for a particular instance on a LAN, or which port should be the root port for an instance. A lower value implies a better priority. In the case of the same priority, the interface index will serve as the tiebreaker, with the lower-numbered interface being preferred over others.

Command Syntax `bridge-group (<1-32> | backbone) priority <0-240> no bridge-group (<1-32> | backbone) priority`

Parameters

`<1-32>`	Specify the bridge group ID.
`backbone`	Backbone bridge.

`<0-240>` Specify the port priority (a lower priority indicates greater likelihood of the interface becoming a root). The priority values can only be set in increments of 16.

Default

By default, port priority for each instance is 128

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#bridge-group 4 priority 80
```

bridge-group spanning-tree

This command is used to enable or disable the spanning-tree on a configured bridge.

Command Syntax `bridge-group <1-32> spanning-tree (disable|enable)`

Parameters

`<1-32>` Specify the bridge group ID.

`disable` Disable spanning tree on the interface. `enable` Enable spanning tree on the interface.

Default

By default, spanning-tree is enabled

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
(config)#interface eth1
(config-if)#bridge-group 1 spanning-tree enable
```

clear spanning-tree detected protocols

Use this command to clear the detected protocols for a specific bridge or interface. This command begins the port migration as per IEEE 802.1w-2001, Section 17.26. After issuing this command, the migration timer is started on the port, only if the force version is RSTP or MSTP (greater versions of RSTP).

Command Syntax `clear spanning-tree detected protocols bridge <1-32>`

Parameters

`<1-32>`	Specify the bridge group ID.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear spanning-tree detected protocols bridge 2
```

clear spanning-tree statistics

Use this command to clear all STP BPDU statistics.

Command Syntax `clear spanning-tree statistics bridge <1-32> clear spanning-tree statistics interface IFNAME (instance (<1-63>)| vlan <1-4094>) bridge <1-32>`

`clear spanning-tree statistics (interface IFNAME| (instance (<1-63>)| vlan <24094>)) bridge <1-32>`

Parameters

`<1-32>`	Specify the bridge identifier.
`IFNAME`	Specify the name of the interface on which protocols have to be cleared.
`<1-63>`	MST instance ID.
`<1-4094>`	VLAN identifier where spanning tree is located <2-4094>

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear spanning-tree statistics bridge 32
```

customer-spanning-tree customer-edge path-cost

Use this command to set the cost of a path associated with a customer edge port on a customer edge spanning tree.

Use the `no` form of this command to remove the cost of a path associated with a customer edge port on a customer edge spanning tree.

Command Syntax `customer-spanning-tree customer-edge path-cost <1-200000000> no customer-spanning-tree customer-edge path-cost`

Parameters `path-cost` Specify the path-cost of a port.

`<1-200000000>` Specify the cost to be assigned to the group.

Default

Assuming a 10 Mb/s link speed, the default value is 200,000

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree customer-edge path-cost 1000
```

customer-spanning-tree customer-edge priority

Use this command to set the port priority for a customer-edge port in the customer spanning tree.

Command Syntax `customer-spanning-tree customer-edge priority <0-240>`

Parameters

`priority`	Specify the port priority.
`<0-240>`	Specify the port priority range (a lower priority indicates greater likelihood of the interface becoming a root). The priority values can only be set in increments of 16.

Default

By default, priority is 1

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree customer-edge priority 100
```

customer-spanning-tree forward-time

Use this command to set the time (in seconds) after which (if this bridge is the root bridge) each port changes states to learning and forwarding. This value is used by all instances.

Use the `no` form of this command to restore the default value of 15 seconds.

Command Syntax `customer-spanning-tree forward-time <4-30> no customer-spanning-tree forward-time`

Parameters

`<4-30>`	Specify the forwarding time delay in seconds.

Note: Care should be exercised if the value is set to less than 7 seconds.

Default

By default, priority is 15 seconds

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree forward-time 6

(config-if)#no customer-spanning-tree forward-time
```

customer-spanning-tree hello-time

Use this command to set the hello-time, the time in seconds after which (if this bridge is the root bridge) all the bridges in a bridged LAN exchange Bridge Protocol Data Units (BPDUs). Avoid a very low value of this parameter as this can lead to excessive traffic on the network; a higher value delays the detection of topology change. This value is used by all instances.

Use the `no` option with this command to restore the default value of the hello-time.

Command Syntax `customer-spanning-tree hello-time <1-10> no customer-spanning-tree hello-time`

Parameters

`<1-10>`	Specify the hello BPDU interval in seconds.

Default

By default, level is 2 seconds

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree hello-time 3

(config-if)#no customer-spanning-tree hello-time
```

customer-spanning-tree max-age

Use this command to set the max-age for a bridge.

Max-age is the maximum time in seconds for which (if a bridge is the root bridge) a message is considered valid. This prevents the frames from looping indefinitely. The value of max-age should be greater than twice the value of hello-time plus one, but less than twice the value of forward delay minus one. The allowable range for max-age is 6-40 seconds. Configure this value sufficiently high, so that a frame generated by a root can be propagated to the leaf nodes without exceeding the max-age.

Use the `no` parameter with this command to restore the default value of max-age.

Command Syntax `customer-spanning-tree max-age <6-40> no customer-spanning-tree max-age`

Parameters

`<6-40>`	Specify the maximum time in seconds to listen for the root bridge.

Default

By default, bridge max-age is 20 seconds

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree max-age 12 (config-if)#no customer-spanning-tree max-age
```

customer-spanning-tree priority

Use this command to set the bridge priority for the spanning tree on a customer edge port. Using a lower priority indicates a greater likelihood of the bridge becoming root. This command must be used to set the priority of the customer spanning tree running on the customer edge port. Use the `no` form of the command to reset it to the default value.

Command Syntax `customer-spanning-tree priority <0-61440> no customer-spanning-tree priority`

Parameters

`<0-61440>`	Specify the bridge priority in the range <0-61440>. Priority values can be set only in increments of 4096.

Default

By default, priority is 61440

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree priority 4096

(config-if)#no customer-spanning-tree priority
```

customer-spanning-tree provider-edge path-cost

Use this command to set the cost of a path associated with a provider edge port on a customer edge spanning tree.

Use the `no` form of this command to remove the cost of a path associated with a provider edge port on a customer edge spanning tree.

Command Syntax `customer-spanning-tree provider-edge svlan <1-4094> path-cost <1-200000000> no customer-spanning-tree provider-edge svlan <1-4094> path-cost`

Parameters

`<1-4094>` Specify the SVLAN identifier of provider edge port.

`<1-200000000>` Specify the cost to be assigned to the group.

Default

Assuming a 10 Mb/s link speed, the default value is 200,000

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree provider-edge svlan 2 path-cost 1000

(config-if)#no customer-spanning-tree provider-edge svlan 2 path-cost
```

customer-spanning-tree provider-edge priority

Use this command to set the port priority for a provider-edge port in the customer spanning tree.

Command Syntax `customer-spanning-tree provider-edge svlan <1-4094> priority <0-240>`

Parameters

<1-4094>	Specify the SVLAN identifier of provider edge port.
<0-240>	Specify the port priority (a lower priority means greater likelihood of the interface becoming root). The priority values can only be set in increments of 16.

Default

By default, priority is 1

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree provider-edge svlan 2 priority 0
```

customer-spanning-tree transmit-holdcount

Use this command to set the transmit-holdcount for a bridge.

Use the `no` parameter with this command to restore the default value of `transmit-holdcount`.

Command Syntax `customer-spanning-tree transmit-holdcount <1-10> no customer-spanning-tree transmit-holdcount`

Parameters

<1-10>	Specify the maximum number that can be transmitted per second.

Default

By default, bridge transmit hold count is 6

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree transmit-holdcount 3

(config-if)#no customer-spanning-tree transmit-holdcount
```

debug mstp

Use this command to turn on, and turn off, debugging and echoing data to the console, at various levels.

Note: This command enables MSTP, RSTP, and STP debugging.

Use the `no` parameter with this command to turn off debugging.

Command Syntax `debug mstp all debug mstp cli debug mstp packet rx debug mstp packet tx debug mstp protocol debug mstp protocol detail debug mstp timer debug mstp timer detail no debug mstp all no debug mstp cli no debug mstp packet rx no debug mstp packet tx no debug mstp protocol no debug mstp protocol detail no debug mstp timer no debug mstp timer detail`

Parameters

`all`	Echoes all spanning-tree debugging levels to the console.
`cli`	Echoes spanning-tree commands to the console.
`packet`	Echoes spanning-tree packets to the console.
`rx`	Received packets.
`tx`	Transmitted packets.
`protocol`	Echoes protocol changes to the console.
`detail`	Detailed output.
`timer`	Echoes timer start to the console.
`detail`	Detailed output.

Command Mode

Exec, Privileged Exec, and Configure modes

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#debug mstp all
(config)#debug mstp cli
(config)#debug mstp packet rx
(config)#debug mstp protocol detail
(config)#debug mstp timer
```

show debugging mstp

Use this command to display the status of debugging of the MSTP system.

Command Syntax `show debugging mstp`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show debugging mstp
MSTP debugging status:
MSTP debugging status:
 MSTP timer debugging is on
 MSTP protocol debugging is on
 MSTP detailed protocol debugging is on
 MSTP cli echo debugging is on
 MSTP transmitting packet debugging is on
 MSTP receiving packet debugging is on
#
```

show spanning-tree

Use this command to show the state of the spanning tree for all STP or RSTP bridge-groups, including named interface and VLANs.

Command Syntax `show spanning-tree show spanning-tree interface IFNAME show spanning-tree mst show spanning-tree mst config show spanning-tree mst interface IFNAME show spanning-tree mst detail show spanning-tree mst detail interface IFNAME show spanning-tree mst instance (<1-63>) interface IFNAME show spanning-tree mst instance (<1-63> | te-msti) show spanning-tree statistics bridge <1-32> show spanning-tree statistics interface IFNAME (instance (<1-63>)| vlan <2-4094>)`

`bridge <1-32>`

`show spanning-tree statistics (interface IFNAME | (instance (<1-63>) | vlan <1-4094>)) bridge <1-32> show`

`spanning-tree vlan range-index`

Parameters `interface` Display interface

information `mst` Display MST information

`statistics` Display statistics of the BPDUs `vlan`

`range-index`

Display a VLAN range-index value

`config` Display configuration information `detail`

Display detailed information `instance` Display

instance information `<1-63>` Specify the instance identifier

`te-msti` Display Traffic Engineering MSTI instance

`<1-32>` Specify the bridge identifier

`IFNAME` Display the interface name

`<2-4094>` Specify a VLAN identifier, associated with the instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following is a sample output of this command displaying spanning tree information.

```
#show spanning-tree
% 1: Bridge up - Spanning Tree Enabled
% 1: Root Path Cost 0 - Root Port 0 - Bridge Priority 32768
% 1: Forward Delay 15 - Hello Time 2 - Max Age 20
% 1: Root Id 80000002b328530a
% 1: Bridge Id 80000002b328530a
% 1: last topology change Wed Nov 19 22:39:18 2008
% 1: 11 topology change(s) - last topology change Wed Nov 19 22:39:18 2008
% 1: portfast bpdu-filter disabled
% 1: portfast bpdu-guard disabled
% 1: portfast errdisable timeout disabled
% 1: portfast errdisable timeout interval 300 sec
%eth2: Ifindex 5 - Port Id 8005 - Role Designated - State Forwarding
%eth2: Designated Path Cost 0
%eth2: Configured Path Cost 200000 - Add type Explicit ref count 1

% eth1: portfast bpdu-filter default - Current portfast bpdu-filter off
% eth1: no root guard configured- Current root guard off
```

Table 3-75 Explains the show command output fields.

Table 3-75: show spanning-tree interface output fields

Field	Description
Bridge up	A network bridge is a computer networking device that creates a single aggregate network from multiple communication networks or network segments.
Root Path Cost	Root cost for the interface.
Root Port	Interface that is the current elected root port for this bridge.

Bridge Priority	Used for the common instance.
Forward Delay	Configured time an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.
Hello Time	Configured number of seconds between transmissions of configuration BPDUs.
Max Age	Maximum age of received protocol BPDUs.
Port Id	Logical interface identifier configured to participate in the MSTP instance.
Role Designated	Designated role for the packets in the interface.
State Forwarding	State of the forwarding packets in the interface.

Field	**Description**
Designated Path Cost	Designated cost for the interface.
Configured Path Cost	Configured cost for the interface.
Designated Port Id	Port ID of the designated port for the LAN segment this interface is attached to.
Priority	Specify the port priority.
Message Age	Number of seconds elapsed since the most recent BPDU was received.
Forward Timer	The forward delay timer is the time interval that is spent in the listening and learning state.
Msg Age Timer	The message age contains the length of time that has passed since the root bridge initially originated the BPDU.
Received RSTP	Number of times the received the RSTP.
Send RSTP	Number of times transmitted the RSTP.

show spanning-tree mst

Use this command to display the filtering database values. This command displays the number of instances created, and VLANs associated with it.

Command Syntax `show spanning-tree mst show spanning-tree mst config show spanning-tree mst detail show spanning-tree mst detail interface IFNAME show spanning-tree mst instance (<1-63>) interface IFNAME show spanning-tree mst instance (<1-63> | te-msti) show spanning-tree mst interface IFNAME`

Parameters

`config`	Display configuration information.
`detail`	Display detailed information.
`interface`	Display interface information.
`instance`	Display instance information.
`<1-63>`	Specify the instance identifier.
`te-msti`	Traffic Engineering MSTI instance.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show spanning-tree mst
% 1: Bridge up - Spanning Tree Enabled
% 1: CIST Root Path Cost 0 - CIST Root Port 0 - CIST Bridge
Priority 32768
% 1: Forward Delay 15 - Hello Time 2 - Max Age 20 - Max-hops 20
% 1: CIST Root Id 80000002b328530a
% 1: CIST Reg Root Id 80000002b328530a
% 1: CIST Bridge Id 80000002b328530a
% 1: 2 topology change(s) - last topology change Wed Nov 19 22:43:21 2008
% 1: portfast bpdu-filter disabled
% 1: portfast bpdu-guard disabled
% 1: portfast errdisable timeout disabled
% 1: portfast errdisable timeout interval 300 sec%
% Instance VLAN
 % 0:       1
 % 2:       3-4
```

Table 3-76 Explains the show command output fields.

Table 3-76: show spanning-tree mst output fields

Field	Description
Bridge up	A network bridge is networking process that creates a single aggregate network from multiple communication networks or network segments.
CIST Root Path Cost	Calculated cost to reach the regional root bridge from the bridge where the command is entered.
CIST Root Port	Interface that is the current elected CIST root port for this bridge.
CIST Bridge	A CIST bridge is networking process that creates a single aggregate network from multiple communication networks.
Priority	Specify the port priority.
Forward Delay	Configured time an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.
Hello Time	Configured number of seconds between transmissions of configuration BPDUs.
Max Age	Maximum age of received protocol BPDUs.
Max-hops	Configured maximum number of hops a BPDU can be forwarded in the MSTP region.

show spanning-tree statistics

Use this command to display detailed BPDU statistics for a spanning tree instance.

Command Syntax `show spanning-tree statistics bridge <1-32> show spanning-tree statistics interface IFNAME (instance (<1-63>)| vlan <2-4094>) bridge <1-32>`

`show spanning-tree statistics (interface IFNAME | (instance (<1-63>) | vlan <14094>)) bridge <1-32>`

Parameters

`<1-32>`	Bridge identifier.
`<1-63>`	MST instance identifier.
`IFNAME`	Displays the interface name.
`<2-4094>`	Specify a VLAN identifier, associated with the instance.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

In the following example, bridge-group 1 is configured for IEEE on the eth2 interface.

```
#show spanning-tree statistics interface eth2 bridge 1

Table 3-77 Explains the show command output fields.

Table 3-77: show spanning-tree statistics output fields

Field	Description
BPDU Related Parameters	Details of the BPDU related parameters.
PORT Based Information & Statistics	Information of the port and interface for which the statistics are being displayed.

Field	Description
STATUS of Port Timers	Status of the port timers.
Other Port-Specific Info	Specific information about the port.

Other Bridge information & Statistics	Information about bridge and statistics being displayed.

spanning-tree autoedge

Use this command to assist in automatic identification of the edge port.

Use the `no` parameter with this command to disable this feature.

Command Syntax `spanning-tree autoedge no spanning-tree autoedge`

Default

By default, spanning-tree autoedge is disabled

Parameters

None

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree autoedge
```

spanning-tree edgeport

Use this command to set a port as an edge-port and to enable rapid transitions.

Use the `no` parameter with this command to set a port to its default state (not an edge-port) and to disable rapid transitions.

Note: This command is an alias to the `spanning-tree portfast` command. Both commands can be used interchangeably.

Command Syntax `spanning-tree`

`edgeport no spanning-tree`

`edgeport`

Default

By default, spanning-tree edgeport is disabled

Parameters

None

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree edgeport
```

spanning-tree guard

Use this command to enable the root guard feature for the port. This feature disables reception of superior BPDUs.

The root guard feature makes sure that the port on which it is enabled is a designated port. If the root guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP).

Use the `no` parameter with this command to disable the root guard feature for the port.

Command Syntax `spanning-tree guard root` `no spanning-tree guard root`

Parameters `root` Set to disable reception of superior BPDUs

Default

By default, spanning-tree guard root is enabled

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree guard root
```

spanning-tree instance restricted-role

Use this command to set the restricted role value for the instance to TRUE.

Use the `no` parameter with this command to set the restricted role value for the instance to FALSE.

Command Syntax `spanning-tree instance <1-63> restricted-role` `no spanning-tree instance <1-63> restricted-role`

Parameters

`<1-63>` Specify the instance ID range.

Default

By default, restricted-role value is FALSE

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree instance 2 restricted-role
```

spanning-tree instance restricted-tcn

Use this command to set the restricted TCN value for the instance to TRUE.

Command Syntax `spanning-tree instance <1-63> restricted-tcn no spanning-tree instance <1-63> restricted`

Parameters

`<1-63>`	Specify the instance ID range.

Default

By default, restricted TCN value is FALSE

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
                              (config-if)#spanning-tree instance 2 restricted-tcn
```

spanning-tree link-type

Use this command to enable or disable point-to-point or shared link types.

RSTP has a backward-compatible STP mode, `spanning-tree link-type shared`. An alternative is the `spanning-tree force-version 0`.

Use the `no` parameter with this command to disable rapid transition.

Command Syntax `spanning-tree link-type auto spanning-tree link-type point-to-point spanning-tree link-type shared no spanning-tree link-type`

Parameters `auto` Sets to either point-to-point or shared based on duplex state. `point-to-point` Enables rapid transition. `shared` Disables rapid transition.

Default

By default, spanning-tree link-type is enabled.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree link-type point-to-point

(config-if)#no spanning-tree link-type
```

spanning-tree mst configuration

Use this command to enter the Multiple Spanning Tree Configuration mode.

Command Syntax `spanning-tree mst configuration`

Parameters

None

Default

No default value is specified.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree mst configuration
(config-mst)#
```

spanning-tree bpdu-filter

Use this command to set the BPDU filter value for individual ports. When the `enable` or `disable` parameter is used with this command, this configuration takes precedence over bridge configuration. However, when the `default` parameter is used with this command, the bridge level BPDU filter configuration takes effect for the port.

Use the `show spanning tree` command to display administratively configured and currently running values of the BPDU filter parameter for the bridge and port (see show spanning-tree).

Use the `no` parameter with this command to revert the port BPDU filter value to default.

Command Syntax `spanning-tree bpdu-filter (enable|disable|default) no spanning-tree bpdu-filter`

Parameters

`default`	Sets the bpdu-filter to the default level.
`disable`	Disables the BPDU-filter.
`enable`	Enables the BPDU-filter.

Default

By default, spanning-tree bpdu-filter is default option

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree bpdu-filter enable

(config-if)#no spanning-tree bpdu-filter
```

spanning-tree bpdu-guard

Use this command to enable or disable the BPDU Guard feature on a port.

This command supersedes the bridge level configuration for the BPDU Guard feature. When the `enable` or `disable` parameter is used with this command, this configuration takes precedence over bridge configuration. However, when the `default` parameter is used with this command, the bridge-level BPDU Guard configuration takes effect.

Use the `show spanning tree` command to display administratively configured and currently running values of the BPDU filter parameter for the bridge and port (see show spanning-tree).

Use the no parameter with this command to set the BPDU Guard feature on a port to default.

Command Syntax `spanning-tree bpdu-guard (enable|disable|default) no spanning-tree bpdu-guard`

Parameters

`default`	Sets the BPDU-guard to the default level.

`disable`	Disables the BPDU-guard.
`enable`	Enables the BPDU-guard.

Default

By default, spanning-tree bpdu-guard is default

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree bpdu-guard enable

(config-if)#no spanning-tree bpdu-guard
```

spanning-tree restricted-domain-role

Use this command to set the restricted-domain-role value of the port to TRUE.

Use the `no` parameter with this command to set the restricted-domain-role value of the port to FALSE.

Command Syntax `spanning-tree restricted-domain-role no`

```
spanning-tree restricted-domain-role
```

Parameters

None

Default

By default, restricted-role value is FALSE

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree restricted-domain-role
```

spanning-tree restricted-role

Use this command to set the restricted-role value of the port to TRUE.

Use the `no` parameter with this command to set the restricted-role value of the port to FALSE.

Command Syntax `spanning-tree restricted-role no spanning-tree restricted-role`

Parameters

None

Default

By default, restricted-role value is FALSE

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree restricted-role
```

spanning-tree restricted-tcn

Use this command to set the restricted TCN value of the port to TRUE.

Use the `no` parameter with this command to set the restricted TCN value of the port to FALSE.

Command Syntax `spanning-tree restricted-tcn no spanning-tree restricted-tcn`

Parameters

None

Default

By default, restricted TCN value is FALSE

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree restricted-tcn
```

spanning-tree te-msti configuration

This command is used to put the terminal into the `te-msti` configuration mode.

After creating a bridge instance and adding VLAN to that bridge instance, use this command to enter `te-msti` configuration mode.

Command Syntax `spanning-tree te-msti configuration`

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree te-msti configuration
(config-te-msti)#
```

storm-control

Use this command to set the rising threshold level for broadcast, multicast, or destination lookup failure traffic. The storm control action occurs when traffic utilization reaches this level.

Storm control is used to block the forwarding of unnecessary flooded traffic. A packet storm occurs when a large number of broadcast packets are received on a port. Forwarding these packets can cause the network to slow down or time out.

Use the `no` form of this command to disable storm control.

Note:Minimum granularity for storm-control is 64kbps.

Command Syntax

```
storm-control (broadcast|multicast|dlf) (level LEVEL | <0-1000000000>
  (kbps|mbps|gbps)) no storm-control
(broadcast|multicast|dlf)
```

Parameters `broadcast` Broadcast rate limiting.

`multicast` Multicast rate limiting. `dlf`

Destination lookup failure limiting.

`level` Sets the percentage of the threshold.

LEVEL The percentage of the threshold; percentage of the maximum speed (pps) of the interface <0.0000-1000.0000>.

<0-1000000000> Sets absolute threshold value <0-1000000000> kbps specifies the units of Kilobits per second. mbps specifies the units of Megabits per second.

gbps specifies the units of Gigabits per second.

Default

By default, storm control is disabled

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#storm-control broadcast level 30

(config)#interface eth0 (config-if)#storm-
control multicast level 30

(config)#interface eth0
```

```
(config-if)#storm-control multicast 300 mbps

(config)#interface eth0
(config-if)#no storm-control multicast
```

CHAPTER 4 RPVST+ Commands

This chapter contains the commands used for Rapid Per VLAN Spanning Tree (RPVST+). RPVST+ enables a bridge to inter-operate with Cisco RPVST+ switches.

RPVST+ uses the Multiple Spanning Tree Protocol (MSTP) with a single VLAN for each Multiple Spanning Tree instance (MSTI). The MST bridges can have different spanning-tree topologies for different VLANs inside a region of similar MST bridges. MSTP, like the Rapid Spanning Tree Protocol (RSTP), provides rapid reconfiguration capabilities and supports load balancing.

This chapter includes the following commands:

- bridge vlan
- bridge vlan priority
- bridge-group vlan
- bridge protocol rpvst+
- bridge rapid-pervlan-spanning-tree
- show spanning-tree rpvst+
- spanning-tree rpvst+ configuration

- spanning-tree vlan restricted-role
- spanning-tree vlan restricted-tcn

bridge vlan

This command creates or deletes a mapping between an MSTI (Multiple Spanning Tree Instance) and a VLAN for RPVST+ operation. There can be only one VLAN per MST instance if the bridge is configured to run in RPVST+ mode.

The VLAN must have already been created. Spanning tree is enabled on each configured VLAN, and one instance of spanning-tree runs on each configured VLAN.

Use the `no` form of the command to disable this functionality.

Command Syntax `bridge <1-32> vlan <2-4094> no bridge <1-32> vlan <2-4094>`

Parameters

`<1-32>`	Bridge identifier.
`<2-4094>`	VLAN identifier.

Command Mode

RPVST+ configure mode

Applicability

This command was introduced in SWMRE version 1.3.3.

Examples

```
#configure terminal
(config)#spanning-tree rpvst+ configuration
(config-rpvst+)#bridge 1 vlan 2
(config-rpvst+)#no bridge 1 vlan 2
```

bridge vlan priority

This command sets the priority value for the spanning-tree on the bridge. The lower the priority of the VLAN on a bridge, the better the chances of the bridge becoming a root bridge, or a designated bridge for the VLAN.

Use the `no` form of this command to set the priority to its default (32,768).

Command Syntax `bridge <1-32> vlan <2-4094> priority <0-61440> no bridge <1-32> vlan <2-4094> priority`

Parameters

`<1-32>`	Bridge identifier.
`<2-4094>`	VLAN identifier.
`<0-61440>`	Bridge priority for the common instance. Set the priority in increments of 4096. A lower priority indicates greater likelihood of becoming root.

Default

By default, priority for each VLAN is 32,768

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.3.

Examples

```
#configure terminal
(config)#bridge 1 vlan 2 priority 80
(config)#no bridge 1 vlan 10 priority
```

bridge-group vlan

Use this command to assign a Rapid Per-VLAN Spanning Tree (RPVST+) instance to a port.

RPVST+ uses port priority as a tiebreaker to determine which port should forward frames for a particular LAN, or which port should be the root port for a VLAN. A lower value implies a better priority. In the case of the same priority, the interface index serves as the tiebreaker, with a lower-numbered interface being preferred over others.

Use the `no` parameter with this command to remove an RPVST+ instance from this port.

Command Syntax `bridge-group <1-32> vlan <2-4094> bridge-group <1-32> vlan <2-4094> path-cost <1-200000000> bridge-group <1-32> vlan <2-4094> priority <0-240> no bridge-group <1-32> vlan <2-4094> no bridge-group <1-32> vlan <2-4094> path-cost no bridge-group <1-32> vlan <2-4094> priority`

Parameters

`<1-32>`	Bridge group identifier.
`<2-4094>`	VLAN identifier.
`<1-200000000>`	Cost of a path associated with the interface.
`<0-240>`	Port priority. A lower priority indicates greater likelihood of the interface becoming a root. Set the priority only in increments of 16.

Command Mode

Interface mode

Applicability

This command was introduced in SWMRE version 1.3.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#bridge-group 1 vlan 10

(config)#interface eth1
(config-if)#bridge-group 1 vlan 10 path-cost 1000
```

```
(config-if)#no bridge-group 1 vlan 10 path-cost

(config)#interface eth1
(config-if)#bridge-group 1 vlan 10 priority 240

(config-if)#no bridge-group 1 vlan 10 priority
```

bridge protocol rpvst+

Use this command to enable Rapid Per-VLAN Spanning Tree on a bridge.

Command Syntax `bridge <1-32> protocol rpvst+`

Parameter

`<1-32>`	Bridge identifier.

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.3.

Example

```
#configure terminal
(config)#bridge 1 protocol rpvst+
```

bridge rapid-pervlan-spanning-tree

Use this command to enable RPVST+ functionality on a bridge.

Use the `no` form of this command to disable RPVST+ functionality on a bridge.

Command Syntax:

```
bridge <1-32> rapid-pervlan-spanning-tree enable
no bridge <1-32> rapid-pervlan-spanning-tree enable (bridge-forward|)
```

Parameters

`<1-32>` Bridge identifier. `enable` Enable the spanning tree protocol. `bridge-forward` Put all ports of the specified bridge into forwarding state.

Default

When the `bridge-forward` option is used with the `no` parameter, the default behavior is to put all bridge ports in the blocking state.

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.3.

Examples

```
#configure terminal
(config)#bridge 1 rapid-pervlan-spanning-tree enable

(config)#no bridge 1 rapid-pervlan-spanning-tree enable bridge-forward
```

show spanning-tree rpvst+

Use this command to display RPVST information.

Command Syntax `show spanning-tree rpvst+ show spanning-tree rpvst+ config show spanning-tree rpvst+ detail show spanning-tree rpvst+ detail interface IFNAME show spanning-tree rpvst+ interface IFNAME show spanning-tree rpvst+ vlan <1-4094>`

`show spanning-tree rpvst+ vlan <1-4094> interface IFNAME`

Parameters

`config`	Display configuration information.
`detail`	Display detailed information.
`IFNAME`	Display interface information.

<1-4094>	Display VLAN information

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in SWMRE version 1.3.3.

Example

The following displays output of this command without any parameters.

```
#show spanning-tree rpvst+
% 1: Bridge up - Spanning Tree Enabled  - topology change detected

```

spanning-tree rpvst+ configuration

Use this command to enter RPVST+ configuration mode after creating a bridge and adding a VLAN to that bridge.

Internally, an RSTP Instance is created for each configured VLAN.

Command Syntax `spanning-tree rpvst+ configuration`

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced in SWMRE version 1.3.3.

Example

```
#configure terminal
(config)#spanning-tree rpvst+ configuration
(config-rpvst+)#
```

spanning-tree vlan restricted-role

Use this command to restrict the role of the interface.

Use the `no` form of this command to not restrict the role of the interface.

Command Syntax `spanning-tree vlan <2-4094> restricted-role no spanning-tree vlan <2-4094> restricted-role`

Parameters

`<2-4094>` VLAN identifier.

Default

The default is to not restrict the role of the interface

Command Mode

Interface mode

Applicability

This command was introduced in SWMRE version 1.3.3.

Example

```
#configure terminal
(config)#interface eth0
                        (config-if)#spanning-tree vlan 10 restricted-role
```

spanning-tree vlan restricted-tcn

Use this command to restrict propagating topology change notifications (TCNs) from the interface.

Use the `no` form of this command to not restrict propagating TCNs from the interface.

Command Syntax `spanning-tree vlan <2-4094> restricted-tcn no spanning-tree vlan <2-4094> restricted_tcn`

Parameters

`<2-4094>` VLAN identifier.

Default

The default is to not restrict propagating TCNs

Command Mode

Interface mode

Applicability

This command was introduced in SWMRE version 1.3.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree vlan 10 restricted-tcn
(config-if)#no spanning-tree vlan 10 restricted_tcn
```

CHAPTER 5 Link Aggregation Commands

This chapter describes the link aggregation commands.

- channel-group mode
- clear lacp
- debug lacp
- interface po
- interface sa
- lacp destination-mac
- lacp discard wrong conversation
- lacp port-priority
- lacp system-priority
- lacp timeout
- port-channel load-balance
- port-channel min-bandwidth
- port-channel min-links
- show debugging lacp
- show etherchannel
- show lacp sys-id
- show lacp-counter
- show port etherchannel
- show static-channel-group
- show static-channel load-balance
- snmp restart lacp
- static-channel-group

channel-group mode

Use this command to add an interface to an existing link aggregation group.

After you execute this command, the interface loses its properties and takes the properties of the aggregated interface.

Use the `no` parameter with this command to remove an interface from a dynamic link aggregation group. When you remove an interface from a LAG, the interface acquires the default interface properties.

Command Syntax `channel-group <1-65535> mode (active|passive)`

`channel-group <1-16383> mode (active|passive)`

`no channel-group`

Parameters

`<1-65535>` Specify a channel group number (without DRNI).

<1-16383>	Specify a channel group number (with DRNI).
mode	Specify a channel mode.
active	Enable LACP negotiation.
passive	Disable LACP negotiation.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#switchport
(config-if)#channel-group 1 mode active
(config-if)#exit

#sh run in po1
!
interface po1
switchport
 port-channel load-balance src-dst-mac
```

The is an example of `no channel-group`:

```
#configure terminal
(config)#interface xe1
(config-if)#switchport
(config-if)#no channel-group
(config-if)#exit

#sh run in xe1
!
interface xe1
!
#sh run in po1
!
interface po1  switchport  port-channel load-balance src-dst-mac !
```

clear lacp

Use this command to clear the counters of all LACP aggregators or a given LACP aggregator.

Command Syntax `clear lacp <1-65535> counters clear lacp counters`

Parameters

`<1-65535>`	Clears a channel-group number.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear lacp 2 counters
```

debug lacp

Use this command to enable LACP debugging.

Use the `no` parameter with this command to disable debugging.

Command Syntax `debug lacp (event|cli|timer|packet|sync|ha|all|rx|tx) no debug lacp (event|cli|timer|packet|sync|ha|allrx|tx) undebug all`

Parameters

`all`	Enables all LACP debugging.
`cli`	Echo commands to console.
`event`	Sets the debug options for LACP events.
`ha`	Echo High availability events to console.
`packet`	Sets the debug option for LACP packets.
`sync`	Echo synchronization to console.
`timer`	Echo timer expiry to console.
`rx`	Echo receiving of lacpdus to console.
`tx`	Echo transmission of lacpdus to console.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#debug lacp all
```

interface po

Use this command to create a dummy dynamic link aggregate interface (by default an L3 LAG interface).

Use the `no` form of this command to remove a dynamic link aggregate group and also it remove the properties of the po from all member ports.

Note:Switchport/routed mode needs to be set for the PO before adding member ports to it.

Command Syntax `interface po<1-16383> no interface po<1-16383>`

Parameters

`<1-16383>`	LACP port priority.

Default

By default, interface po is L3 LAG interface

Command Mode

Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.4.

Example

```
#configure terminal
(config)#interface po1
(config-if)#switchport
(config-if)#exit
```

interface sa

Use this command to create a dummy static link aggregate interface (by default an L3 LAG interface) and to add an interface to an existing static link aggregation group.

Use the `no` form of this command to remove a static link aggregate group and also remove the properties of the po from all member ports.

Command Syntax

`interface sa<1-12>`

`no interface sa<1-12>`

Parameters

`<1-12>`	Channel group number.

Default

By default, interface sa is L3 LAG interface

Command Mode

Configuration mode

Applicability

This command was introduced in SWMRE version 1.3.4.

Example

```
#configure terminal
(config)#interface sa1
(config-if)#switchport
(config-if)#exit
```

lacp destination-mac

Use this command to set the address type to use for sending LACPDUs (Link Aggregation Control Protocol Data Units).

Note:The interface must be an aggregation port.

Use the `no` form of this command to set the address type to its default (multicast group address).

Command Syntax

```
lacp destination-mac (customer-bridge-group-address | multicast-group-address |
  non-tmpr-group-address)
no lacp destination-mac
```

Parameters `customer-bridge-group-address`

Customer bridge group address

`multicast-group-address`

Multicast group address (default)

`non-TPMR-group-address`

Non-Two-Port Media Access Control Relay (TPMR) group address

Default

By default, lacp destination-mac is multicast-group-address

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#config terminal
(config)#interface eth1
(config-if)#lacp destination-mac customer-bridge-group-address
```

lacp discard wrong conversation

Use this command to enable or disable discarding frames with an incorrect port conversation identifier.

Note: The interface must be a dynamic port-channel.

Command Syntax `lacp discard wrong conversation (disable|enable)`

Parameters

`disable`	Do not discard frames with an incorrect port conversation identifier
`enable`	Discard frames with an incorrect port conversation identifier

Default

By default, lacp discard wrong conversation is disabled

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#config terminal
(config)#interface po1
(config-if)#lacp discard wrong conversation enable
```

lacp port-priority

Use this command to set the priority of a channel. Channels are selected for aggregation based on their priority with the higher priority (numerically lower) channels selected first.

Use the `no` parameter with this command to set the priority of port to the default value (32768).

Command Syntax `lacp port-priority <1-65535>`

`no lacp port-priority`

Parameters

`<1-65535>`	Specify the LACP port priority.

Default

By default, lacp port priority is 32768

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#lacp port-priority 34
```

lacp system-priority

Use this command to set the LACP system priority. This priority determines the system responsible for resolving conflicts in the choice of aggregation groups.

Note: A lower numerical value has a higher priority.

Use the `no` parameter with this command to set the system priority to its default value (32768).

Command Syntax `lacp system-priority <1-65535> no lacp system-priority`

Parameters

`<1-65535>`	System priority.

Default

By default, system priority is 32768

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#lacp system-priority 6700
```

lacp timeout

Use this command to set either a short or long timeout value on a port. The timeout value is the number of seconds before invalidating a received LACP data unit (DU).

Command Syntax `lacp timeout (short|long)`

Parameters

`short`	LACP short timeout. 3 seconds.
`long`	LACP long timeout. 90 seconds.

Default

By default, lacp timeout is long

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following sets the LACP short timeout on a port.

```
#configure terminal
(config)#interface eth0
(config-if)#lacp timeout short
```

port-channel load-balance

Use this command to configure LACP port-channel load-balancing and set port-selection criteria (PSC) for an interface.

Use the `no` option with this command to remove the load-balancing configuration and unset PSC.

Command Syntax

```
port-channel load-balance (dst-mac|src-mac|src-dst-mac|dst-ip|src-ip|src-dst-ip|dst-port|src-port|src-dst-port|rtag7)
no port-channel load-balance
```

Parameters

`dst-ip`	Destination IP address-based load balancing.
`dst-mac`	Destination MAC address-based load balancing.
`dst-port`	Destination TCP/UDP address-based load balancing.
`src-dst-ip`	Source and Destination IP address-based load balancing.
`src-dst-mac`	Source and Destination MAC address-based load balancing.
`src-dst-port`	Source and Destination TCP/UDP address-based load balancing.
`src-ip`	Source IP address-based load balancing.
`src-mac`	Source MAC address-based load balancing.
`src-port`	Source port address-based load balancing.
`rtag7`	Hashing based on packet type. IP - IP/Layer4 header, L2 - Layer2 header, TRILL - TRILL packet.

Default

By default, load balance is src-dst-port

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface po1
(config-if)#port-channel load-balance src-dst-mac
```

port-channel min-bandwidth

Use this command to set the minimum active bandwidth of aggregated links.

Note: The port-channel min-links feature and this feature are mutually exclusive. Both configurations cannot exist at the same time.

Use the `no` form of this command to set the bandwidth to the collective bandwidth of the LACP member ports.

Command Syntax `port-channel min-bandwidth BANDWIDTH` `no port-channel min-bandwidth`

Parameters

`BANDWIDTH` <1-999>k for 1 to 999 kilobits/s

<1-999>m for 1 to 999 megabits/s

<1-1000>g for 1 to 1000 gigabits/s

Default

The default is the collective bandwidth of the LACP member ports.

Command Mode

Interface mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Example

```
#configure terminal
(config)#interface po1
(config-if)#port-channel min-bandwidth 999m
```

port-channel min-links

Use this command to set the minimum number of aggregated links that need to be up in the LAG interface.

When a the minimum number of links are configured for a LAG, if the active links for that interface become less than the configured value, then the whole LAG is brought down. When the number of active links become the same or more than the configured value, then the whole LAG is restored.

Note: The port-channel min-bandwidth feature and this feature are mutually exclusive. Both configurations cannot exist at the same time.

Use the `no` form of this command to remove the minimum number of aggregated links that need to be up in the LAG interface.

Note: The minimum number of aggregated links should be same across both ends of an aggregation interface. If not configured, then on one of the nodes the LAG port will be treated as up and on the other as down and traffic will be discarded.

Note: When a LAG port is moved to the down state because it does not have the minimum number of required links up and running, then the traffic on the remaining interfaces in the LAG arecounted as port-block discards.

Command Syntax `port-channel min-links <2-32> no port-channel min-links`

Parameters

`<2-32>`	Minimum number of links

Default

By default, port channel min-link is disabled.

Command Mode

Interface mode

Applicability

This command was introduced in SWMRE version 1.3.4.

Example

```
#configure terminal
(config)#interface po1
(config-if)#port-channel min-links 10
(config-if)#exit
```

show debugging lacp

Use this command to display the status of the debugging of the LACP system.

Command Syntax `show debugging lacp`

Parameters

None

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show debugging lacp

LACP debugging status:
LACP timer debugging is on
```

show etherchannel

Use this command to display information about link aggregation groups.

Command Syntax `show etherchannel show etherchannel <1-65535>` With MLAG:

`show etherchannel (<1-16383>|) detail show etherchannel (<1-16383>|) load-balance show etherchannel (<1-16383>|) summary` Without MLAG:

`show etherchannel (<1-65535>|) detail show etherchannel (<1-65535>|) load-balance show etherchannel (<1-65535>|) summary`

Parameters

`<1-65535>`	Specify channel-group number.
`<1-16383>`	Specify channel-group number.
`detail`	Specify detailed etherchannel information.
`load-balance`	Specify load balancing.
`summary`	Specify Etherchannel summary information.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show etherchannel summary
% Aggregator po1 185
% Aggregator Type: Layer3
% Admin Key: 0001 - Oper Key 0001
%   Link: eth3 (5) sync: 0
-------------------------------------
% Aggregator po4 186
% Admin Key: 0004 - Oper Key 0004
%   Link: eth2 (4) sync: 0
-------------------------------------
% Aggregator po5 187
% Admin Key: 0005 - Oper Key 0005
%   Link: eth1 (3) sync: 0
```

```
#show etherchannel detail
% Aggregator po1 185
% Aggregator Type: Layer3
%  Mac address: 08:00:27:36:f5:7d
%  Admin Key: 0001 - Oper Key 0001
%  Actor LAG ID- 0x8000,08-00-27-fa-4b-0e,0x0001
%  Receive link count: 0 - Transmit link count: 0
%  Individual: 0 - Ready: 0
%  Partner LAG ID- 0x0000,00-00-00-00-00-00,0x0000
%   Link: eth3 (5) sync: 0
%  Collector max delay: 5
------------------------------------------------
% Aggregator po4 186
%  Mac address: 08:00:27:76:0c:57
%  Admin Key: 0004 - Oper Key 0004
%  Actor LAG ID- 0x8000,08-00-27-fa-4b-0e,0x0004
%  Receive link count: 0 - Transmit link count: 0
%  Individual: 0 - Ready: 1
%  Partner LAG ID- 0x0000,00-00-00-00-00-00,0x0000
%   Link: eth2 (4) sync: 0
%  Collector max delay: 5
------------------------------------------------
% Aggregator po5 187
%  Mac address: 08:00:27:2f:d5:ae
%  Admin Key: 0005 - Oper Key 0005
%  Actor LAG ID- 0x8000,08-00-27-fa-4b-0e,0x0005
%  Receive link count: 0 - Transmit link count: 0
%  Individual: 0 - Ready: 0
%  Partner LAG ID- 0x0000,00-00-00-00-00-00,0x0000
%   Link: eth1 (3) sync: 0
%  Collector max delay: 5
```

Table 5-78 explains the show command output fields.

Table 5-78: show etherchannel detail output

Field	Description
Aggregator	Link aggregators name and ID number.
Mac address	Unique MAC address for link identification.
Admin Key	LACP administrative key – automatically configured value on each port configured to use LACP.
Oper Key	LACP operator key on Partner – automatically configured value on each port configured to use LACP.

Actor LAG ID	LAG ID consisting of MAC address plus aggregator ID number for this Actor.
Receive link count	The number of link received from the peer LAG.
Transmit link count	The number of links contained transmitted to the peer LAG.
Individual	The individual physical network interfaces or ports contained in the LAG.
Ready	The number of links in the active state on this Actor.
Partner LAG ID	Partner LAG ID consisting of MAC address plus aggregator ID number.

Table 5-78: show etherchannel detail output (Continued)

Description
Interface and ID number of the link.
MAC address synchronization enables a MC-LAG Partner to forward Layer 3 packets arriving on this interfaces with either its own MAC address or its Partner's.
Maximum period of wait time between sending of two subsequent Ethernet frames on a link.

show lacp sys-id

Use this command to display the LACP system identifier and priority.

Command Syntax `show lacp sys-id`

Parameters `sys-id` Display LACP system ID and priority

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show lacp sys-id
% System 8000,00-0e-0c-83-37-27
```

show lacp-counter

Use this command to display the packet traffic on all ports of all present LACP aggregators, or a given LACP aggregator.

Command Syntax `show lacp-counte show lacp-counter <1-65535>`

Parameters

`<1-65535>`	Channel-group number

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show lacp-counter 555

Port      LACPDUs          Marker          Pckt err
        Sent    Recv    Sent    Recv    Sent    Recv
```

show port etherchannel

Use this command to display details about a PO and its members' interfaces or to display details of a single member interface of a PO.

Command Syntax `show port etherchannel IFNAME`

Parameters

`IFNAME`	Interface name

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show port etherchannel ce29/1
LAG ID                        : 0x8000,cc-37-ab-a0-89-ca,0x0002

```

Note: Most of the output of this command is duplicated in the show etherchannel command (see also the 802.3ad specificiation). The output of the `show port etherchannel` command is primarily a list of state machine values. An explanation of the state machine bits follows. See Figure 5-71.

Table 5-79 explains the show command output fields.

Table 5-79: show port etherchannel detailed output

Entry	Description
Actor/Partner state	The Actor's and Partner's state variables, encoded as individual bits within a single octet.
ACT	LACP_Activity is encoded in bit 0. Active LACP is encoded as a 1; Passive LACP as a 0.

Table 5-79: show port etherchannel detailed output (Continued)

Entry	Description
TIM	LACP_Timeout is encoded in bit 1. Short Timeout is encoded as a 1; Long Timeout as a 0.
AGG	Aggregability is encoded in bit 2. Aggregatable is encoded as a 1; Individual is encoded as a 0.
SYN	Synchronization is encoded in bit 3. In_Sync is encoded as a 1; Out_Of_Sync is encoded as a 0.

COL	Collecting is encoded in bit 4. True is encoded as a 1; False is encoded as a 0.
DIS	Distributing is encoded in bit 5. True is encoded as a 1; False is encoded as a 0.
DEF	Defaulted is encoded in bit 6.
EXP	Defaulted is encoded in bit 7.

Bits 7 and 8 are reserved; these are ignored on receipt and transmitted as zero. However, the received value of these bits is recorded on receipt to accurately reflect the actor's view of the partner's state in outgoing PDUs.

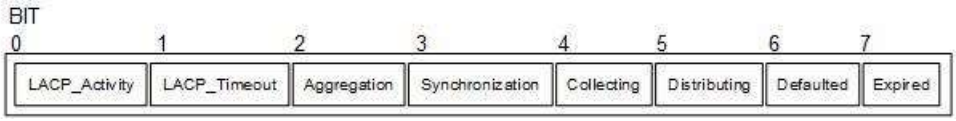

Figure 5-71: Diagram of state machine octet

show static-channel-group

Use this command to display the types of load-balancing port selection criteria (PSC) used on configured static aggregators.

Command Syntax `show static-channel-group (<1-12>|)`

Parameters

`<1-12>`	Specify channel-group number.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following is an example of the output of this command:

```
#show  static-channel-group 1 %
Static Aggregator: sa1
% Member:    eth1
```

show static-channel load-balance

Use this command to display information about static channel groups.

Command Syntax `show static-channel (<1-12>|) load-balance` **Parameters**

`<1-12>`	Specify static-channel-group number.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following is an example of the output of this command:

```
#show static-channel load-balance
% Static Aggregator: sa5
Source and Destination Mac address
-----------------------------------------
% Static Aggregator: sa3
Source and Destination Mac address
-----------------------------------------
```

```
% Static Aggregator: sa1
Source and Destination Mac address

#show static-channel 1 load-balance
% Static Aggregator: sa1
Source and Destination Mac address
```

snmp restart lacp

Use this command to restart SNMP in LACP.

Command Syntax `snmp restart lacp`

Parameters

None

Default

By default, snmp restart lacp is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
(config)#snmp restart lacp
```

static-channel-group

Use this command to create a static link aggregation group or to add an interface to an existing link aggregation group.

Use the `no` form of this command to remove an interface from a static link aggregation group without removing the static link aggregation group itself.

Command Syntax `static-channel-group <1-12> no static-channel-group`

Parameter

`<1-12>`	Channel group number.

Default

By default, static channel group is disabled

Command Mode

Interface mode

Applicability

This command was introduced in SWMRE version 1.3.4.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#switchport
(config-if)#static-channel-group 1
(config-if)#exit

#sh run in sa1
! interface
sa1
switchport
 port-channel load-balance src-dst-mac
```

This is an example of `no static-channel-group`:

```
#configure terminal
(config)#interface xe1
(config-if)#switchport
(config-if)#no static-channel-group
(config-if)#exit

#sh run in xe1
!
interface xe1
!
```

```
#sh run in sa1
! interface
sa1
switchport
port-channel
load-balance
src-dst-mac !
```

CHAPTER 6 Multi-Chassis Link Aggregation Commands

This chapter describes the Multi-Chassis Link Aggregation commands.

Multi-Chassis Link Aggregation is also called MC-LAG, MLAG, or Distributed Resilient Network Interconnect (DRNI). In this document, it is called MC-LAG.

- domain-address
- debug mcec
- domain hello timeout
- domain priority
- domain system number
- intra-domain-link
- mlag
- mcec domain configuration
- mode
- show mlag detail
- show mlag summary
- show mcec statistics
- switchover type

domain-address

Use this command to configure domain address, which helps to identify the mcec domain.

Use the `no` form of this command to remove the domain address.

Command Syntax `domain-address <domain-id> no domain-address`

Parameters `domain-id` domain address in HHHH.HHHH.HHHH format

Command Mode

MCEC mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#config terminal
(config)#mcec domain configuration (config-mcec-domain)#domain-address 1111.2222.3333
```

debug mcec

Use this command to view debugging logs for MLAG.

Use the `no` form of this command to remove debugging logs for MLAG.

Command Syntax `debug mcec (timer|event|hello|info|cli|mac-sync|all) no debug mcec (timer|event|hello|info|cli|mac-sync|all)`

Parameters

`all`	ALL
`cli`	CLI
`event`	Event
`hello`	Hello
`info`	Info
`mac-sync`	Mac Sync
`timer`	Timer

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#debug mcec all
#no debug mcec all
```

domain hello timeout

Use this command to specify the domain hello-timeout value.

Command Syntax `domain-hello-timeout (long|short)`

Parameters

`long`	Long Timeout
`short`	Short Timeout

Command Mode

MCEC mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#config terminal
(config)#mcec domain configuration
                                    (config-mcec-domain)#domain-hello-timeout long
```

domain priority

Use this command to specify the priority value associated with mcec domain.

Use the `no` form of this command to remove the priority value associated with mcec domain.

Command Syntax `domain-priority <1-65535> no domain-priority`

Parameters

`<1-65535>` Priority Value

Command Mode

MCEC mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#config terminal
(config)#mcec domain configuration
(config-mcec-domain)#domain-priority 2
```

domain system number

Use this command to configure domain system number, which uniquely identifies domain system in mcec domain.

Use the `no` form of this command to configure domain system number.

Command Syntax `domain-systm-number <1-2> no domain-systm-number`

Parameters

`<1-2>`	Domain System Number

Command Mode

MLAC mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#config terminal
(config)#mcec domain configuration (config-mcec-domain)#domain-system-number 2
```

intra-domain-link

Use this command to map an interface as intra domain link that connects the domain system with its neighbor in a mcec domain.

Use the no form of this command to unmap the interface configured as intra domain link that connects the domain system with its neighbor in a mcec domain.

Command Syntax `intra-domain-link <IFNAME> no intra-domain-link`

Parameters

`IFNAME`	Interface name

Command Mode

MCEC mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#config terminal
(config)#mcec domain configuration (config-mcec-domain)#intra-domain-link eth2
```

mlag

Use this command to map a port-channel to mlag instance.

Note:The interface must be a dynamic port channel.

Note: All MLAG nodes must use the same MAC table size.

Use the `no` form of this command to un-map the port channel from mlag instance.

Command Syntax `mlag <1-256> no mlag`

Parameters

`<1-256>`	MC-LAG identifier

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#config terminal
```

```
(config)#interface po1
```

```
(config-if)#mlag 1
```

mcec domain configuration

Use this command to enter MCEC Domain configuration mode to configure mcec domain information.

Command Syntax `mcec domain configuration`

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#config terminal
(config)#mcec domain configuration
(config-mcec-domain)#
```

mode

Use this command to set the MC-LAG mode.

Use the no form of this command to turn off this feature.

Command Syntax `mode (active-active | active-standby)` `no mode (active-active | active-standby)`

Parameters

`active-active`	The interface is the active interface that carries the traffic
`active-standby`	The interface is ready to transition to the active-active state should a failure occur in the other node

Default `active-standby`

Command Mode

Interface mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
(config)#
(config)#interface mlag1
(config-if)#mode active-active

(config)#
(config)#interface mlag1
(config-if)#mode active-standby
```

show mlag detail

Use this command to display details about MC-LAG configuration and status.

Command Syntax `show mlag <1-256> detail`

Parameters

`<1-256>`	MLAG group number

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#sh mlag 1 detail

MLAG-1
Mapped Aggregator : po1
Admin Key : 32769
Oper Key: 16385
Physical properties Digest : dd 9c f 76 dd b6 5f 2f eb a1 d3 bb 8d 96 fc 82

```

Table 6-80 Shows the output details.

Table 6-80: Show mlag output details

Entry	Description
Info RCV State	Details of the RCV.
Info Periodic Time State	A simple state space formulation of a general digital periodic time series is constructed.
Mlag Sync	MAC address synchronization enables a MC-LAG Partner to forward Layer 3 packets arriving on this interfaces with either its own MAC address or its Partner's.

Entry	Description
Mapped Aggregator	Map the output of the aggregator in the interface which is active transformation.
Admin Key	MLAG administrative key – automatically configured value on each port configured to use MLAG.
Oper Key	MLAG operator key on Partner – automatically configured value on each port configured to use MLAG.
Physical properties Digest	Physical properties of the digest.
Neigh Admin Key	Neigh administrative key – automatically configured value on each port configured to use MLAG.
Neigh Physical Digest	Neigh physical properties of the digest.

show mlag summary

Use this command to display MC-LAG configuration and status.

Command Syntax `show mlag domain <details|summary>`

Parameters

`details`	details
`summary`	summary

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#show mlag domain summary
-----------------------------------

Info Periodic Time State	A simple state space formulation of a general digital periodic time series is constructed.
Mlag Sync	MAC address synchronization enables a MC-LAG Partner to forward Layer 3 packets arriving on this interfaces with either its own MAC address or its Partner's.

show mcec statistics

Use this command to display all the statistics related to hello and info pdu's in mcec domain.

Command Syntax `show mcec statistics`

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Entry	Description
RX Hello PDUs	Total number of received hello PDUs.
TX Hello PDUs	Total number of transmitted hello PDUs.
RX Info PDUs	Total number of received Info PDUs.
TX Info PDUs	Total number of transmitted Info PDUs.
RX Mac Sync PDUs	Total number of received Mac Sync PDUs.

TX Mac Sync PDUs	Total number of transmitted Mac Sync PDUs.

Examples

```
#sh mcec statistics
Unknown MCCPDU received on the system : 0

-----------------------------------
IDP xe49
-----------------------------------
Valid RX Hello PDUs : 109
Valid TX Hello PDUs : 201
Valid RX Info PDUs: 23
Valid TX Info PDUs : 28
Valid RX Mac Sync PDUs : 5
Valid TX Mac Sync PDUs : 4

MLAG 1
Valid RX Info PDUs : 5
Valid TX Info PDUs : 7
```

Table 6-80 Shows the output details.

Table 6-82: Show mcec statistics details

switchover type

Use this command to set the MC-LAG switchover type.

Use the `no` form of this command to turn off switchover.

Command Syntax `switchover type revertive <1-255> switchover type non-revertive`

`no switchover type (revertive | non-revertive)`

Parameters

`revertive` If a failure happens that triggers a switchover, after failure recovery the initially-active node becomes active again

`<1-255>` Switch back to the initially-active node this many seconds after failure recovery `non-revertive`

Do not switch back to the initially-active node after failure recovery

Default `revertive` in 10

seconds

Command Mode

Interface mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
(config)#
(config)#interface mlag1
(config-if)#switchover type revertive 20
```

```
(config)#
(config)#interface mlag1
(config-if)#switchover type non-revertive
```

CHAPTER 7 Traffic Mirroring Commands

This chapter provides a description of syntax, and examples for Traffic Mirroring. It includes the following commands:

- monitor session
- monitor session shut
- source port
- source vlan
- destination port
- no shut
- shut
- filter
- description
- remote destination
- show monitor
- show monitor session
- show filter
- show monitor running configuration

monitor session

Use this command to create a local or remote monitor session. By default, a local monitor session is created.

A monitor session consists of:

- A single destination interface, referred to as a mirror-to port or a single remote destination
- One or more source interfaces (egress, ingress, or both)
- One or more VLAN sources in the ingress direction
- One or more filters that can be applied to filter the mirrored packets Use the `no` parameter to delete a monitor session.

Command Syntax `monitor session <1-18> ( | type ( local | remote )) no monitor session ( <1-18> | all )`

Parameters

`<1-18>`	Session number
`local`	Create a local session
`remote`	Create a remote source node session
`all`	All sessions

Default

By default, monitor session type is local and will not be active by default

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#monitor session 1
(config-monitor)#exit
(config)#monitor session 3 type remote
(config-monitor)#exit
(config)#no monitor session 1
```

monitor session shut

Use this command to deactivate one or all monitor sessions.

Use the `no` parameter to activate one or all monitor sessions.

Command Syntax `monitor session (<1-18> | all) shut no monitor session (<1-18> | all) shut`

Parameters

<1-18>	Session number
all	All sessions

Default

Monitor session will not be active by default

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#monitor session 3 shut

                    (config)#no monitor session 3 shut
```

source port

Use this command to configure a source port per monitor session in either ingress or egress or both directions. Source port can be physical interface or a trunk port. Use the `no` parameter to remove the source port.

Command Syntax `source interface IFNAME ( rx | tx | both | ) no source interface IFNAME ( rx | tx | both | )`

Parameters

IFNAME	Interface name
rx	Ingress direction
tx	Egress direction
both	Both directions

Default

Source port will be mirrored for both directions if the direction is not specified

Command Mode

Monitor configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#monitor session 1
(config-monitor)#source interface xe1 both
(config-monitor)#no source interface xe1 tx
```

source vlan

Use this command to configure one or more VLANs as source per monitor session. A VLAN as source will be mirrored only in the ingress direction. Up to 32 VLANs can be configured as source per monitor session.

Use the `no` parameter to remove vlan source from monitor session.

Command Syntax `source vlan`

`VLAN_RANGE no source vlan`

`VLAN_RANGE`

Parameters

`VLAN_RANGE`	VLAN identifier or VLAN identifier range

Default

A trunk port is a member of all VLANs by default.

Command Mode

Monitor configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#monitor session 1
(config-monitor)#source vlan 2
(config-monitor)#source vlan 4-10
(config-monitor)#no source vlan 2-5,10
```

destination port

Use this command to configure a mirror-to port per local monitor session. A destination port can be a physical port or a trunk port.

Use the `no` parameter to remove the destination port from a local monitor session.

Command Syntax `destination`

`interface IFNAME no destination`

`interface IFNAME`

Parameters

`IFNAME`	Interface name

Default

The Firewall device uses the outgoing interface by default.

Command Mode

Monitor configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface xe3
(config-if)#switchport
(config-if)#exit
(config)#monitor session 1 (config-
monitor)#destination interface xe3 (config-
monitor)#no destination interface xe3
```

no shut

Use this command to activate a monitor session

Command Syntax `no shut`

Parameters

None

Default

Monitor session will not be active by default.

Command Mode

Monitor configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#monitor session 3
(config-monitor)#no shut
```

shut

Use this command to de-activate a monitor session.

Command Syntax `shut`

Parameters

None

Default

Monitored session is not active by default.

Command Mode

Monitor configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#monitor session 3
(config-monitor)#shut
```

filter

Use this command to add filters to the monitor session. Filters can be applied only in case of ingress mirroring.

Use the `no` parameter to remove the filter from monitor session.

Command Syntax

```
filter {vlan <2-4094> | cos <0-7> | dest-mac (host XXXX.XXXX.XXXX |
  XXXX.XXXX.XXXX XXXX.XXXX.XXXX) | src-mac (host XXXX.XXXX.XXXX | XXXX.XXXX.XXXX
  XXXX.XXXX.XXXX) | frame-type (ETHTYPE | arp (req | resp|) (sender-ip A.B.C.D|)
  (target-ip A.B.C.D|)
  | ipv4 (src-ip (A.B.C.D | A.B.C.D/M)|) (dest-ip (A.B.C.D | A.B.C.D/M)|) |
  ipv6 (src-ip X:X::X:X/M |) (dest-ip X:X::X:X/M |))} no filter {vlan <2-
4094> | cos <0-7> | dest-mac (host XXXX.XXXX.XXXX |
  XXXX.XXXX.XXXX XXXX.XXXX.XXXX) | src-mac (host XXXX.XXXX.XXXX | XXXX.XXXX.XXXX
  XXXX.XXXX.XXXX) | frame-type (ETHTYPE | arp (req | resp|) (sender-ip A.B.C.D|)
  (target-ip A.B.C.D|) | ipv4 (src-ip (A.B.C.D | A.B.C.D/M)|) (dest-ip (A.B.C.D |
  A.B.C.D/M)|) | ipv6 (src-ip X:X::X:X/M |) (dest-ip X:X::X:X/M |))}
```

Parameters

`<2-4094>`	VLAN identifier
`<0-7>`	COS number
`XXXX.XXXX.XXXX`	MAC address
`ETHTYPE`	Ethertype
`arp`	ARP frames
`req`	Request frames `resp` Response frames
`A.B.C.D`	Single IP address
`A.B.C.D/M`	IP addresses with mask
`X:X::X:X/M`	IPv6 addresses with mask

Default

No default value is specified.

Command Mode

Monitor configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#monitor session 3
(config-monitor)#filter dest-mac host 0000.0001.2421 frame-type ipv4
(config-monitor)#filter cos 3 frame-type arp req sender-ip 2.2.2.1
(config-monitor)#no filter dest-mac host 0000.0001.2421 frame-type ipv4
(config-monitor)#no filter cos 3 frame-type arp req sender-ip 2.2.2.1
```

description

Use this command to add a description to the monitor session.

Use the `no` parameter to delete a description of the monitor session.

Command Syntax `description LINE no description`

Parameters

`LINE`	Enter the description string

Default

No default value is specified.

Command Mode

Monitor configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#monitor session 3
                                    (config-monitor)#description "port mirror rx"
(config-monitor)#no description
```

remote destination

Use this command to configure a destination VLAN and the reflector port for the remote monitor session.

Use the `no` parameter to remove a destination from a remote monitor session.

Command Syntax `destination remote vlan <2-4094> reflector-port IFNAME no destination remote`

Parameters

<2-4094>	VLAN identifier
IFNAME	Interface name

Default

By default, all VLANs active on the trunk are monitored.

Command Mode

Monitor configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#no vlan 900 bridge 1
(config)#interface xe3
(config-if)#switchport
(config)#monitor session 1
(config-monitor)#destination remote vlan 900 reflector-port xe3
(config-monitor)#no destination remote
```

show monitor

Use this command to display states of all monitor sessions. If a session is down, the reason is displayed.

Command Syntax `show`

```
monitor
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show monitor
Session   State          Reason                Description
------- ----------- --------------------- --------------------------------
1       down        No sources configured
2       down        Dst in wrong mode
```

show monitor session

Use this command to display the configuration details of one or more monitor sessions.

Command Syntax `show monitor session (<1-18>|all|(range RANGE)) (brief|)`

Parameters

`<1-18>`	Session number
`all`	All sessions
`RANGE`	Session number range (n1-n2)
`brief`	Brief information

Command Mode

Exec mode or Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show monitor session 1 session 1 ------------
--- type              : local
state              : down (Session admin shut) source intf        :
tx                  : xe1 xe3 xe4 rx                  : xe2 xe3 xe4
both              : xe3 xe4 source VLANs      : rx                :
2,5-10,15,18-20 destination ports : xe5 filter count       :

Legend: f = forwarding enabled, l = learning enabled #
```

Table 7-83 Explains the show command output fields

Table 7-83: Show monitor session output fields

Field	Description
Type	Type of monitor session.
State	State of the security flow filter.
Rx	Incoming flow (source and destination IP addresses).
Tx	Reverse flow (source and destination IP addresses).

Field	Description
Both	Incoming and reverse flow (source and destination IP address)
Destination Port	Name of the destination port to be matched.
Source intf	Number of maximum intf central source session.
Source VLANs	Number of maximum VLANs central source session.
Filter count	Used to count number of lines in a file or table.

© Symanitron Proprietary

show filter

Use this command to display filters for one or more monitor sessions.

Command Syntax `show monitor session (<1-18>|all|(range RANGE)) filter`

Parameters

`<1-18>` Session number `all` All sessions

`RANGE` Session number range (n1-n2)

Command Mode

Exec mode or Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show monitor session 1 filter
session 1 ---------------
filter count : 3 --------------
-

match set 1 ---------------
destination mac address : 0000.0002.4451 (host) source
mac address : 0000.0012.2288 (host)
---------------

match set 2 ---------------
frame type : arp sender ip
address : 2.2.2.5 target ip
addres : 2.2.2.8 -----------
----

match set 3 ---------------
destination mac address : 0000.0001.1453 (host)
frame type : ipv4 source ip address : 3.3.3.5 #
```

show monitor running configuration

Use this command to display the mirror-related running configuration.

Command Syntax `show running-config monitor (all|)`

Parameters `all` Show running configuration with defaults

Command Mode

Exec mode or Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show running-config monitor
! monitor session 1 source
interface xe10 rx destination
interface po1 no shut #
```

CHAPTER 8 VLAN and Private VLAN Commands

This chapter has the commands used to manage VLANs and private VLANs.

- private-vlan association
- private-vlan community
- private-vlan isolated
- private-vlan primary
- show dtag vlan
- show vlan access-map
- show vlan
- show vlan brief
- show vlan classifier
- switchport access
- switchport hybrid
- switchport mode
- switchport mode access ingress-filter
- switchport mode hybrid acceptable-frame-type
- switchport mode hybrid ingress-filter
- switchport mode trunk ingress-filter
- switchport trunk allowed
- switchport trunk allowed vlan dtag
- switchport trunk native
- switchport mode private-vlan
- switchport private-vlan host-association
- switchport private-vlan mapping
- vlan classifier activate
- vlan classifier group
- vlan classifier rule ipv4
- vlan classifier rule mac
- vlan classifier rule proto
- vlan database
- vlan dtag
- vlan state
- vlan VLAN_RANGE bridge

private-vlan association

Use this command to associate a secondary VLAN to a primary VLAN. Only one isolated VLAN can be associated to a primary VLAN. Multiple community VLANs can be associated to a primary VLAN.

Use the `no` form of this command to remove association of all the secondary VLANs to a primary VLAN.

Command Syntax `private-vlan association add VLAN_RANGE private-vlan association remove VLAN_RANGE no private-vlan association`

Parameters

`add`	Add a VLAN to private VLAN list.
`remove`	Removes values associated with a single VLAN.
`VLAN_RANGE`	Specify VLAN ID 1-4094 or range(s): 1-5, 10 or 2-5,7-19 of the private VLANs to be configured

Default

By default, functionality is disabled

Command Mode

VLAN Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#vlan database
(config-vlan)#private-vlan association add 3-4
(config-vlan)#private-vlan association remove 3-4
(config-vlan)#no private-vlan association
```

private-vlan community

Use this command to set a VLAN type for a private (community) VLAN.

Use the `no` form of this command to remove the specified private VLAN.

Command Syntax `private-vlan <2-4094> community bridge <1-32> no private-vlan <2-4094> community bridge <1-32>`

Parameters

<2-4094>	Specify a private VLAN identifier.	bridge	Specify the bridge identifier.

Default

By default, private vlan is disabled

Command Mode

VLAN Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#vlan database
                (config-vlan)#private-vlan 4 community bridge 1
```

private-vlan isolated

Use this command to create an isolated private VLAN.

Use the no form of this command to remove the specified private VLAN.

Command Syntax private-vlan <2-4094> isolated bridge <1-32> no private-vlan <2-4094> isolated bridge <1-32>

Parameters

<2-4094>	Specify a private VLAN identifier.	bridge	Specify the bridge identifier.

Default

By default, private vlan is disabled

Command Mode

VLAN Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#vlan database
                (config-vlan)#private-vlan 3 isolated bridge 1
```

private-vlan primary

Use this command to create a primary VLAN.

Use the no form of this command to remove the specified private VLAN.

Command Syntax private-vlan <2-4094> primary bridge <1-32> no private-vlan <2-4094> primary bridge <1-32>

Parameters

<2-4094> Specify a private VLAN identifier. bridge Specify the bridge identifier.

Default

By default, private vlan is disabled

Command Mode

VLAN Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#vlan database
(config-vlan)#private-vlan 2 primary bridge 1
```

show dtag vlan

Use this command to display information about VLAN double tagging.

Command Syntax

```
show dtag
vlan
DTAG_VLAN_I
D
```

Parameters

DTAG-VLAN-IDs Outer-VLAN identifier and inner-VLAN identifier in the format 100.200, where 100 is the outer tag and 200 is the inner tag

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Example

```
#show dtag vlan 2000.3001
```

Table 8-84 explains the output.

Table 8-84: show dtag vlan output

Field	Description
Bridge	Bridge number
VLAN ID	VLAN identifier
Name	Double tag-VLAN identifers
State	VLAN state: ACTIVE, SUSPEND, or INVALID
H/W Status	Hardware status: UP or DOWN
Member ports	Interfaces that are part of the VLAN and whether untagged (u) or tagged (t)

show vlan access-map

Use this command to display information for VLAN access maps.

Command Syntax `show vlan access-map`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show vlan access-map Vlan access-map myMap 10
match ip: myMap        action: drop
```

show vlan

Use this command to display information about static, dynamic or all VLANs.

Command Syntax `show vlan (all|static|dynamic|auto) bridge <1-32>`

Parameters

`<1-32>`	Displays the bridge group ID.
`all`	Displays all VLANs (static and dynamic).
`static`	Displays static VLANs.
`dynamic`	Displays dynamic VLANs.
`auto`	Displays auto configured VLANs.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#sh vlan all bridge 1
Bridge VLAN ID Name State H/W Status Member ports

                                                                (u)-
Untagged, (t)-Tagged
======= ======= ================ ======= ==========
==========================
1       1       default          ACTIVE  Up         xe2(u)
xe10(u)
1       2       vlan2            ACTIVE  Up         xe10(t)
1       10      VLAN0010         ACTIVE  Up         xe2(t)
xe10(t)
1       20      VLAN0020         ACTIVE  Up         xe2(t)
xe10(t)
1       30      VLAN0030         ACTIVE  Up         xe10(t)
1       40      VLAN0040         ACTIVE  Up         xe10(t)
1       50      VLAN0050         ACTIVE  Up         xe10(t)
1       60      VLAN0060         ACTIVE  Up
xe10(t) #
```

Table 8-85 Explains the show command output fields.

Table 8-85: show vlan output fields

Field	Description
Bridge	Number of bridge in the interface.
VLAN ID	VLAN identifier of the VLAN listed.
Name	Name of the VLAN.
State	Indicates whether the physical link is operational and can pass packets.

Field	Description
H/W Status	Indicates that the hardware is operational.
Member ports	The tagged interfaces to which a VLAN is associated.

show vlan brief

Use this command to display brief VLAN information for all bridges.

Command Syntax `show vlan (brief | <2-4094>)`

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

The following is a sample output from this command when using the `all` parameter.

```
#show vlan brief

Bridge          VLAN ID  Name            State   Member ports
                                                 (u)-Untagged, (t)-Tagged
=============== ======= ================ ======= ===============================
1               1       default          ACTIVE  eth2(u)

0               1       default          ACTIVE
0               2       new              ACTIVE
```

Table 8-86 Explains the show command output fields.

Table 8-86: show vlan brief output fields

Field	Description
Bridge	Number of bridge in the interface.
VLAN ID	VLAN identifier of the VLAN listed.
Name	Name of the VLAN.
State	Indicates whether the physical link is operational and can pass packets.

H/W Status	Indicates that the hardware is operational.
Member ports	The tagged interfaces to which a VLAN is associated.

show vlan classifier

Use this command to display information on configured VLAN classifier groups, interfaces configured for a VLAN group or all the groups, or all configured VLAN classifier rules.

If either a group ID or rule ID is not specified, all configured VLAN classifier rules are shown. If either a group ID or rule ID is specified, a specific configured VLAN classifier rule is shown.

Command Syntax `show vlan classifier group interface`

```
IFNAME  show  vlan  classifier  group  (<1-16>|)
show vlan classifier rule(<1-256>|)
```

Parameters

`group`	Displays group activated information.
`<1-16>`	Displays the group ID
`interface`	Displays interface information.
`interface`	Displays interface group information.
`group`	Displays group activated information.
`<1-16>`	Displays the group ID.
`rule`	Displays VLAN classifier rule ID.
`<1-256>`	Displays rule ID information.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

This example displays groups for VLAN classifier groups:

```
#show vlan classifier group 1 vlan
classifier group 1 add rule 1
```

This example displays interfaces for all VLAN classifier groups:

```
#show vlan classifier interface group vlan
classifier group 1 interface fe2 vlan
classifier group 1 interface fe3 vlan
classifier group 2 interface fe5 vlan
classifier group 3 interface fe7
```

This example displays interfaces for VLAN classifier group 1:

```
#show vlan classifier interface group 1
vlan classifier group 1 interface fe2 vlan
classifier group 1 interface fe3
```

This example displays interfaces for VLAN classifier rule 1:

```
#show vlan classifier rule 1 vlan classifier rule 1 mac 222.2222.2222 vlan 2
```

© Symanitron Proprietary

switchport access

Use this command to change the default VLAN on the current interface.

Note: Symanitron does not recommend using VLAN identifier 1 because of interoperability issues with other vendors' equipment.

Use the `no` parameter to remove an existing VLAN.

Command Syntax `switchport access vlan <2-4094> no switchport access vlan`

Parameter

`<2-4094>`	Specify the VLAN identifier.

Default

The switchport access vlan default value is 3968.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

This example shows the steps of a typical VLAN session, creating and destroying a VLAN.

```
#configure terminal
(config)#interface eth0
(config-if)#switchport access vlan 3

(config)#interface eth0
(config-if)#no switchport access vlan
```

switchport hybrid

Use this command to set the switching characteristics of the interface to hybrid. Both tagged and untagged frames will be classified over hybrid interfaces.

For a VLAN range, specify two VLAN identifiers: the lowest and then the highest separated by a hyphen. For a VLAN list, specify the VLAN identifiers separated by commas. Do not enter spaces between the hyphens or commas.

Use the `no` parameter to turn off allowed hybrid switching.

Command Syntax `switchport hybrid allowed vlan all switchport hybrid vlan <2-4094> switchport hybrid allowed vlan none switchport hybrid allowed vlan except VLAN_ID switchport hybrid allowed vlan remove VLAN_ID switchport hybrid allowed vlan add VLAN_ID egress-tagged (enable|disable) no switchport hybrid no switchport hybrid vlan`

Parameters

`all`	Allow all VLANs to transmit and receive through the interface.
`none`	Allow no VLANs to transmit and receive through the interface.
`except`	Allow all VLANs except these VLANs to transmit and receive through the interface.
`VLAN_ID`	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.
`remove`	Remove these VLANs from the member set.
`VLAN_ID`	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.
`add`	Add these VLANs to the member set.
`VLAN_ID`	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.
`egress-tagged`	Whether to tag outgoing frames.
`enable`	Enable egress tagging for outgoing frames.
`disable`	Disable egress tagging for outgoing frames.

Default

By default, switchport hybrid is enabled.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following shows adding a single VLAN to the member set.

```
(config-if)#switchport hybrid allowed vlan add eg switchport hybrid allowed
vlan add 2 egress-tagged enable
```

The following shows adding a range of VLANs to the member set.

```
(config-if)#switchport hybrid allowed vlan add eg switchport hybrid allowed
vlan add 2-4 egress-tagged enable
```

switchport mode

Use this command to set the switching characteristics of the Layer 2 interface.

Command Syntax `switchport mode (access|hybrid|trunk|provider-network|customer-edge |customer-network|private-vlan)`

Parameters

`access`	Access.
`hybrid`	Hybrid.
`trunk`	Trunk.
`provider-network`	Provider network.
`customer-network`	Customer network.

Default

By default, switchport hybrid is enabled

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode access
```

switchport mode access ingress-filter

Use this command to set the switching characteristics of the interface to access mode, and classify untagged frames only. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

Command Syntax `switchport mode access ingress-filter (enable|disable)`

Parameters

`ingress-filter` Set the ingress filtering for the received frames.

`enable` Set the ingress filtering for received frames. Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/trunk) are discarded. This is the default value.

`disable` Turn off ingress filtering to accept frames that do not meet the classification criteria.

Default

Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/ trunk) are discarded.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode access ingress-filter enable
```

switchport mode hybrid acceptable-frame-type

Use this command to set the interface acceptable frame types. This processing occurs after VLAN classification.

Command Syntax `switchport mode hybrid acceptable-frame-type (all|vlan-tagged)`

Parameters `all` Set all frames can be received `vlan-tagged` Accept only classified frames that belong to the port's member set.

Default

Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/ trunk) are discarded.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode hybrid acceptable-frame-type vlan-tagged
```

switchport mode hybrid ingress-filter

Use this command to set the switching characteristics of the interface as hybrid, and classify both tagged and untagged frames. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

Command Syntax `switchport mode hybrid ingress-filter (enable|disable)`

Parameters

`enable`	Set the ingress filtering for received frames. Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/trunk) are discarded. This is the default value.
`disable`	Turn off ingress filtering to accept frames that do not meet the classification criteria.

Default

Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/ trunk) are discarded.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode hybrid ingress-filter enable
```

switchport mode trunk ingress-filter

Use this command to set the switching characteristics of the interface as trunk, and specify only tagged frames. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

Command Syntax `switchport mode trunk ingress-filter (enable|disable)`

Parameters

ingress-filter	Set the ingress filtering for the received frames.
enable	Set the ingress filtering for received frames. Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/trunk) are discarded. This is the default value.
disable	Turn off ingress filtering to accept frames that do not meet the classification criteria.

Default

Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/ trunk) are discarded.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode trunk ingress-filter enable
```

switchport trunk allowed

Use this command to set the switching characteristics of the interface to trunk.

For a VLAN range, specify two VLAN identifiers: the lowest and then the highest separated by a hyphen. For a VLAN list, specify the VLAN identifiers separated by commas. Do not enter spaces between the hyphens or commas.

Use the `no` parameter to remove all VLAN identifiers configured on this port.

Command Syntax `switchport trunk allowed vlan all`

`switchport trunk allowed vlan none switchport trunk allowed vlan add VLAN_ID switchport trunk allowed vlan except VLAN_ID switchport trunk allowed vlan remove VLAN_ID no switchport trunk`

Parameters

all	Allow all VLANs to transmit and receive through the interface.
none	Allow no VLANs to transmit and receive through the interface.
add	Add these VLANs to the member set.
VLAN_ID	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.
except	All VLANs except these VLANs are part of the member set.
VLAN_ID	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.
remove	Remove these VLANs from the member set.

VLAN_ID	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.

Default

Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/ trunk) are discarded.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following shows adding a single VLAN to the port's member set.

```
(config)#interface eth0
(config-if)#switchport trunk allowed vlan add 2
```

The following shows adding a range of VLANs to the port's member set.

```
(config)#interface eth0
(config-if)#switchport trunk allowed vlan add 2-4
```

© Symanitron Proprietary

switchport trunk allowed vlan dtag

Use this command to maintain a mapping between the double-tagged logical interfaces with the physical interfaces for the purpose of enabling VLAN-translation on the port alone.

An example of when to use this command is in a GPON application, where an S-tag uniquely identifies an OLT channel partition and a C-tag uniquely identifies a subscriber/service on that channel partition.

Command Syntax `switchport trunk allowed vlan add dtag DTAG-VLAN-IDs switchport trunk allowed vlan remove dtag DTAG-VLAN-IDs`

Parameters

`add`	Add a mapping
`remove`	Remove a mapping
`DTAG-VLAN-IDs`	Outer-VLAN identifier and inner-VLAN identifier in the format 100.200, where 100 is the outer tag and 200 is the inner tag

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in SWMRE version 1.3.5.

Examples

```
(config)#int mlag1
(config-if)#switchport
(config-if)#bridge-group 1
(config-if)#switchport mode trunk (config-if)#switchport
trunk allowed vlan add 100,2000 (config-if)#switchport trunk
allowed vlan add dtag 2000.3001
```

switchport trunk native

Use this command to configure native VLANs for this port. The native VLAN is used for classifying the incoming untagged packets.

Use the `no` parameter to revert the native VLAN to the default VLAN identifier 1.

Command Syntax `switchport trunk native vlan VLAN_ID no switchport trunk native vlan`

Parameter

`VLAN_ID`	VLAN identifier(s) <1-4094>. You can specify a single VLAN, or a VLAN list.

For a VLAN list, specify the VLAN identifiers separated by commas. Do not enter spaces in between the hyphens or commas.

Default

The default is that ingress filtering is off and all frame types are classified and accepted.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#switchport trunk native vlan 2

(config)#interface eth0 (config-if)#no
switchport trunk native vlan
```

switchport mode private-vlan

Use this command to make a layer2 port as a host port or promiscuous port.

Use the `no` form of this command to remove the configuration.

Command Syntax `switchport mode private-vlan (host | promiscuous)` `no switchport mode private-vlan (host | promiscuous)`

Parameters

`host` This port type can communicate with all other host ports assigned to the same community VLAN, but it cannot communicate with the ports in the same isolated VLAN. All communications outside of this VLAN must pass through a promiscuous port in the associated primary VLAN.

`promiscuous` A promiscuous port can communicate with all interfaces, including the community and isolated ports within a private VLAN

Default

By default, switchport mode private-vlan is host.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0 (config-if)#switchport mode private-vlan host
(config)#interface eth1
(config-if)#switchport mode private-vlan promiscuous
(config)#interface eth2
(config-if)#no switchport mode private-vlan promiscuous
```

switchport private-vlan host-association

Use this command to associate a primary VLAN and a secondary VLAN to a host port. Only one primary and secondary VLAN can be associated to a host port.

Use the `no` form of this command to remove the association.

Command Syntax `switchport private-vlan host-association <2-4094> add <2-4094> no switchport private-vlan host-association`

Parameters

`<2-4094>` VLAN identifier of the primary VLAN. `add` Adds the secondary VLAN.

`<2-4094>` VLAN identifier of the secondary VLAN (either isolated or community).

Default

By default, switchport mode private-vlan value is 1

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport private-vlan host-association 2 add 3

#configure terminal
(config)#interface eth0
(config-if)#no switchport private-vlan host-association
```

switchport private-vlan mapping

Use this command to associate a primary VLAN and a set of secondary VLANs to a promiscuous port.

Use the `no` form of this to remove all the association of secondary VLANs to primary VLANs for a promiscuous port.

Command Syntax `switchport private-vlan mapping <2-4094> add VLAN_ID switchport private-vlan mapping <2-4094> remove VLAN_ID no switchport private-vlan mapping`

Parameters

`<2-4094>`	VLAN identifier of the primary VLAN.
`add`	Adds the secondary VLAN.
`remove`	Removes the secondary VLAN.
`VLAN_ID`	VLAN identifier <2-4094> of the secondary VLAN (either isolated or community).

Default

By default, switchport mode private-vlan mapping value is 1

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport private-vlan mapping 2 add 3-4
(config-if)#switchport private-vlan mapping 2 remove 3-4

(config-if)#no switchport private-vlan mapping
```

vlan classifier activate

Use this command to activate the VLAN classifier.

Use no form of this command to deactivate the VLAN classifier.

Command Syntax `vlan classifier activate <1-16> vlan <2-4096> no vlan classifier activate <1-16>`

Parameters

`<1-16>`	Indicates the VLAN classifier activate identifier.
`<2-4094>`	VLAN identifier of the primary VLAN.

Default

By default, vlan classifier activate value is 1

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface eth2
                (config-if)#vlan classifier activate 1 vlan 2

(config-if)#no vlan classifier activate 1
```

vlan classifier group

Use this command to create a subnet-based VLAN classifier group. A group indicates a VLAN classifier group ID.

Command Syntax `vlan classifier group <1-16> (add | delete) rule <1-256> no vlan classifier group <1-16>`

Parameters

`add`	Adds a rule to a group.
`delete`	Deletes a rule from a group.
`rule`	Indicates the VLAN classifier rule identifier `<1-256>`.

Default

By default, vlan classifier group value is 1

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#vlan classifier group 1 delete rule 1
(config)#no vlan classifier group 2
```

vlan classifier rule ipv4

Use this command to create a subnet-based VLAN classifier rule and map it to a specific VLAN. If the source IP address matches the IP subnet specified in the VLAN classifier rule, received packets are mapped to the designated VLAN.

Command Syntax `vlan classifier rule <1-256> ipv4 A.B.C.D/M no vlan classifier rule <1-256>`

Parameters

`A.B.C.D/M`	Indicates the IPv4 address classification. Enter the address in A.B.C.D/M format.

Default

By default, vlan classifier rule is VLAN1

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#vlan classifier rule 2 ipv4
20.20.20.2/24 (config)#no vlan classifier rule 2
```

vlan classifier rule mac

Use this command to create a subnet-based VLAN classifier rule and map it to a specific VLAN.

If the source IP address matches the IP subnet specified in the VLAN classifier rule, received packets are mapped to the designated VLAN.

Command Syntax `vlan classifier rule <1-256>`

`mac WORD no vlan classifier rule <1-256>`

Parameters

`WORD`	Indicate the Mac address classification. Enter the address in HHHH.HHHH.HHHH format.

Default

By default, vlan classifier rule value is VLAN1

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#vlan classifier rule 2 mac fe80::22e::b5ff:fee8:6/64
(config)#no vlan classifier rule 2
```

vlan classifier rule proto

Use this command to create a subnet-based VLAN classifier rule for a protocol and map it to a specific VLAN. If the source IP address matches the IP subnet specified in the VLAN classifier rule, received packets are mapped to the designated VLAN.

Command Syntax

```
vlan classifier rule <1-256> proto (ip|ipv6|ipx|x25|arp|rarp|atalkddp|atalkaarp|
```

```
atmmulti|atmtransport|pppdiscovery|pppsession|xeroxpup|xeroxaddrtrans|g8bpqx25|
ieeepup|ieeeaddrtrans|dec|decdnadumpload|decdnaremoteconsole|decdnarouting
| declat|decdiagnostics|deccustom|decsyscomm|<0-65535>)
no vlan classifier rule <1-256>
```

Parameters

`<0-65535>`	Ethernet decimal
`arp`	Address Resolution Protocol
`atalkaarp`	Appletalk AARP
`atalkddp`	Appletalk DDP
`atmmulti`	MultiProtocol Over ATM
`atmtransport`	Frame-based ATM Transport
`dec`	DEC Assigned
`deccustom`	DEC Customer use
`decdiagnostics`	EC Diagnostics
`decdnadumpload`	DEC DNA Dump/Load
`decdnaremoteconsole`	DEC DNA Remote Console
`decdnarouting`	DEC DNA Routing
`declat`	DEC LAT
`decsyscomm`	DEC Systems Comms Arch
`g8bpqx25`	G8BPQ AX.25
`ieeeaddrtrans`	Xerox IEEE802.3 PUP Address Translation
`ieeepup`	Xerox IEEE802.3 PUP
`ip`	IP address
`ipv6`	IPv6 address
`ipx`	IPX address
`pppdiscovery`	PPPoE discovery
`pppsession`	PPPoE session
`rarp`	Reverse Address Resolution
`x25`	CCITT X.25
`xeroxaddrtrans`	Xerox PUP Address Translation
`xeroxpup`	Xerox PUP

ethv2	Ethernet v2
nosnapllc	Indicates LLC without snap encapsulation snapllcIndicates LLC snap encapsulation

Default

By default, vlan classifier rule value is VLAN1

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
                  (config)#vlan classifier rule 2 proto
ip (config)#no vlan classifier rule 2
```

vlan database

Use this command to enter the VLAN configuration mode to add, delete, or modify values associated with a single VLAN.

Command Syntax `vlan`

```
database
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

In the following example, note the change to VLAN configuration mode from Configure mode:

```
#configure terminal
(config)#vlan database
(config-vlan)#
```

vlan dtag

Use this command to enable or disable double tagging packets with an outer-VLAN identifier and an inner-VLAN identifier.

An example of when to use this command is in a GPON application, where an S-tag uniquely identifies an OLT channel partition and a C-tag uniquely identifies a subscriber/service on that channel partition.

Use the `no` form of this command to not double tag packets.

Command Syntax `vlan dtag DTAG-VLAN-IDs bridge <1-32> state (enable|disable)`
`subscriber no vlan dtag DTAG-VLAN-IDs bridge <1-32>`

Parameters

`DTAG-VLAN-IDs` Outer-VLAN identifier and inner-VLAN identifier in the format 100.200, where 100 is the outer tag and 200 is the inner tag

`<1-32>` Bridge number `enable` Enable

double tagging `disable` Suspend

double tagging

Default

No default value is specified

Command Mode

VLAN database mode

Applicability

This command was introduced inSWMRE version 1.3.5.

Example

```
(config)#vlan database
(config-vlan)#vlan dtag 2000.3001 bridge 1 state enable subscriber
```

vlan state

This command enables or disables the state of a particular VLAN on the bridge.

Command Syntax `vlan <2-4094> bridge <1-32> (state (enable|disable)|)`

Parameters

`<1-32>`	Specify bridge group ID
`state`	Indicates the operational state of the VLAN

`enable`	Sets VLAN into a enable state.
`disable`	Sets VLAN into a disable state.
`name`	The VLAN name
`WORD`	The name of the VLAN

Default

By default, vlan bridge state is disabled.

Command Mode

VLAN Configuration mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#vlan database
(config-vlan)#vlan 45 bridge 1 state enable
```

vlan VLAN_RANGE bridge

.This command allows you to create a single/range of VLAN’s on the VLAN aware bridges.

Use the no form of this command to delete the VLAN.

Command Syntax `vlan VLAN_RANGE bridge <1-32> vlan VLAN_RANGE bridge <1-32> (name WORD|) state (enable | disable) no vlan VLAN_RANGE bridge <1-32>`

Parameters

`VLAN_RANGE`	The vlan-id or range of vlan-id's separated by ','&'-'
`bridge`	Specify the bridge group ID in the range <1-32>.
`state`	Indicates the operational state of the VLAN.
`enable`	Sets VLAN into an enable state.

`disable`	Sets VLAN into a disable state.

Default

By default, vlan bridge state is disabled

Command Mode

Configuration Mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
(config)#vlan 3-40,56 bridge 4
(config)#no vlan 2-5 bridge 2
```

© Symanitron Proprietary

CHAPTER 9 DHCP Snooping Commands

This chapter provides a description of the syntax and examples DHCP snooping. It includes the following commands:

- clear ip dhcp snooping binding
- debug ip dhcp snooping
- ip dhcp packet strict-validation
- ip dhcp snooping
- ip dhcp snooping binding
- ip dhcp snooping database
- ip dhcp snooping information option
- ip dhcp snooping ratelimit
- ip dhcp snooping trust
- ip dhcp snooping verify mac-address
- ip dhcp snooping vlan
- renew ip dhcp snooping binding database
- show debugging ip dhcp snooping
- show ip dhcp snooping
- show ip dhcp snooping binding

- show ip dhcp arp-inspection statistics

clear ip dhcp snooping binding

Use this command to remove all entries from the binding table.

Command Syntax `clear ip dhcp snooping (source|) binding bridge <1-32>`

Parameters

`<1-32>`	Bridge number
`source`	IP source guard

Default

No default value is specified.

Command Mode

Privileged Exec Mode and Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear ip dhcp snooping binding bridge 1
```

debug ip dhcp snooping

Use this command to enable the debugging DHCP snooping.

Use the `no` parameter to disable the debug options.

Command Syntax `debug ip dhcp snooping (event|rx|tx|packet|all) no debug ip dhcp snooping (event|rx|tx|packet|all)`

Parameters

`event`	Enable event debugging
`rx`	Enable receive debugging
`tx`	Enable transmit debugging
`packet`	Enable packet debugging
`all`	Enable all debugging

Default

By default all debugging options are disabled.

Command Mode

Exec mode and configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#debug ip dhcp snooping all
#no debug ip dhcp snooping packet
```

ip dhcp packet strict-validation

Use this command to enable strict validation of DHCP packets. Strict validation of the DHCP packet checks that the DHCP option field in the packet is valid including the magic cookie value in the first four bytes of the options field. The device drops the packet if validation fails. Use the `no` parameter to disable strict validation.

Command Syntax `ip dhcp packet strict-validation`

`bridge <1-32> no ip dhcp packet strict-validation`

`bridge <1-32>`

Parameters

`<1-32>`	Bridge number

Default

By default strict validation of the DHCP packets is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#conf term
(conf)#ip dhcp packet strict-validation bridge 1
(conf)#no ip dhcp packet strict-validation bridge 1
```

ip dhcp snooping

Use this command to enable DHCP snooping on the bridge level.

Use the `no` parameter to remove the entire DHCP snooping configuration.

Command Syntax `ip dhcp snooping bridge <1-32> no ip dhcp snooping bridge <1-32>`

Parameters

`<1-32>`	Bridge number

Default

By default dhcp snooping will be disabled on the bridge.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#ip dhcp snooping bridge 1
(config)#no ip dhcp snooping bridge 1
```

ip dhcp snooping binding

Use this command to create a static binding entry in the binding table. All the DHCP responses will be validated against the static entries. If the response does not match the entry in the binding table, the response packet is dropped.

Use the `no` parameter to remove an entry from the binding table.

Command Syntax

```
ip dhcp snooping binding bridge <1-32> XXXX.XXXX.XXXX <1-4094> (ipv4 A.B.C.D | ipv6
```

X:X::X:X) IFNAME no ip dhcp snooping binding bridge <1-32> XXXX.XXXX.XXXX <1-4094> (ipv4 | ipv6)

Parameters

<1-32>	Bridge number
XXXX.XXXX.XXXX	MAC address
<1-4094>	VLAN identifier
A.B.C.D	IPv4 address
X:X::X:X	IPv6 address
IFNAME	Interface name

Default

By default binding table will not have any entry

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#ip dhcp snooping binding bridge 1 0001.0002.0003 2 ipv4 12.0.0.1 xe1
(config)#no ip dhcp snooping binding bridge 1 0001.0002.0003 2 ipv4
```

ip dhcp snooping database

Use this command to write the entries in the binding table to persistent storage.

Command Syntax ip dhcp snooping database bridge <1-32> **Parameters**

<1-32>	Bridge number

Default

No default value is specified.

Command Mode

Privileged Exec Mode and Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#ip dhcp snooping database bridge 1
```

ip dhcp snooping information option

Use this command to insert option 82 information into DHCP packets.

Use the `no` parameter to disable inserting option 82.

Command Syntax `ip dhcp snooping information option bridge <1-32> no ip dhcp snooping information option bridge <1-32>`

Parameters

`<1-32>`	Bridge number

Default

By default address option 82 information insertion is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#conf term
            (conf)#ip dhcp snooping information option bridge 1
                        (conf)#no ip dhcp snooping information option bridge 1
```

ip dhcp snooping ratelimit

Use this command to limit the rate of DHCP packets per second.

Use the no parameter to set the rate limit to its default value (100 pps).

Command Syntax `ip dhcp snooping ratelimit RATELIMIT bridge <1-32> no ip dhcp snooping ratelimit bridge <1-32>`

Parameters

`RATELIMIT`	Packets per second <0-2048>
`<1-32>`	Bridge number

Default

The default rate limit value is 100 packets per second.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#conf term
                                    (conf)#ip dhcp snooping ratelimit 2000 bridge 1
                    (conf)#no ip dhcp snooping ratelimit bridge 1
```

ip dhcp snooping trust

Use this command to mark an interface as trusted. All DHCP servers must be connected to the trusted interface.

Use the `no` parameter to remove an interface from the list of trusted interfaces.

Command Syntax `ip dhcp snooping trust`

`no ip dhcp snooping trust`

Parameters

None

Default

By default all interfaces are untrusted.

Command Mode

Interface mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#ip dhcp snooping trust
(config-if)#no ip dhcp snooping trust
```

ip dhcp snooping verify mac-address

Use this command to enable the DHCP snooping MAC address verification. If the device receives a DHCP request packet on an untrusted interface and the source MAC address and the DHCP client hardware address do not match, the device drops the packet.

Use the `no` parameter to disable the address verification.

Command Syntax `ip dhcp snooping verify mac-address bridge <1-32>`

`no ip dhcp snooping verify mac-address bridge <1-32>`

Parameters

<1-32>	Bridge number

Default

By default address verification is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#conf term
(conf)#ip dhcp snooping verify mac-address bridge 1
(conf)#no ip dhcp snooping verify mac-address bridge 1
```

ip dhcp snooping vlan

Use this command to enable DHCP snooping for the given VLAN.

Use the no parameter to disable the DHCP snooping on the VLAN.

Command Syntax ip dhcp snooping vlan VLAN_RANGE2 bridge <1-32> no ip dhcp snooping vlan VLAN_RANGE2 bridge <1-32>

Parameters

VLAN_RANGE2	VLAN identifier <1-4094>
<1-32>	Bridge number

Default

By default DHCP snooping will be disabled on all the vlans

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#ip dhcp snooping vlan 10 bridge 1
                (config)#no ip dhcp snooping vlan 10 bridge 1
```

renew ip dhcp snooping binding database

Use this command to populate the binding table by fetching the binding entries from persistent storage.

Command Syntax `renew ip dhcp snooping (source|) binding database bridge <1-32>`

Parameters

`<1-32>`	Bridge number
`source`	IP source guard

Default

No default value is specified.

Command Mode

Privileged Exec Mode and Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#renew ip dhcp snooping binding database bridge 1
```

show debugging ip dhcp snooping

Use this command to display the enabled debugging options.

Command Syntax `show debugging ip dhcp snooping`

Parameters

None

Command Mode

Privileged Exec Mode and Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show debugging ip dhcp snooping
DHCP snoop debugging status:
DHCP snoop event debugging is on
DHCP snoop tx debugging is on
```

show ip dhcp snooping

Use this command to display the DHCP configuration, including trusted ports, rate limit, configured VLAN, active VLAN, and strict validation status.

Command Syntax `show ip dhcp snooping bridge <1-32>`

Parameters

`<1-32>`	Bridge number

Command Mode

Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#sh ip dhcp snooping bridge 1

Bridge Group                                          : 1
DHCP snooping is                                      : Enabled
DHCP snooping option82 is                             : Disabled
Verification of hwaddr field is                       : Disabled

Yes

DHCP snooping IP Source Guard is configured on the following Interfaces

Interface               Source Guard
---------------         ------------
```

show ip dhcp snooping binding

Use this command to display the dhcp snooping binding table.

Command Syntax `show ip dhcp snooping (source|) binding bridge <1-32>`

Parameters

`<1-32>`	Bridge number
`source`	DHCP snooping IP source guard

Command Mode

Privileged Exec Mode and Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
# show ip dhcp snooping binding bridge 1

Total number of static IPV4 entries                : 1
Total number of dynamic IPV4 entries               : 0
Total number of static IPV6 entries                : 0
Total number of dynamic IPV6 entries               : 0

MacAddress          IpAddress      Lease(sec)     Type       VLAN    Interface
--------------    -------------   ----------  -----------   ----    ----------
0001.0002.0003       12.0.0.1          0         static       2      xe2
```

Table 9-87 explains the show command output fields.

Table 9-87: show ip dhcp snooping binding output details

Entry	Description
Total number of static IPV4 entries	Number of static IPV4 entries in the interface.
Total number of dynamic IPV4 entries	Number of dynamic IPV4 entries in the interface.
Total number of static IPV6 entries	Number of static IPV6 entries in the interface.
Total number of dynamic IPV6 entries	Number of dynamic IPV6 entries in the interface.
Mac Address	MAC address forwards the packet into a given dhcp instance.
IP Address	IP address of the peer device.
Lease (sec)	The DHCP lease time in seconds provided to untrusted IP addresses.
Type	Configured either statically or dynamically by the DHCP server.

Table 9-87: show ip dhcp snooping binding output details (Continued)

	Description
	Identifier of the number.
	Interface is being snooped.

show ip dhcp arp-inspection statistics

Use this command to display the dhcp snooping dynamic ARP inspection statistics information.

Command Syntax `show ip dhcp snooping arp-inspection statistics bridge <1-32>`

Parameters

`<1-32>`	Bridge number

Command Mode

Privileged Exec Mode and Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#show ip dhcp snooping arp-inspection statistics bridge 1

bridge     forwarded  dai dropped ------     ---------
-----------
1          0          0
```

Table 9-88 explains the show command output fields.

Table 9-88: show ip dhcp snooping arp-inspection statistics output

Field	Description
bridge	The bridge identifier (number) on which snooping is being used.
forward	The number of packets forwarded to neighbor.
dai dropped	The number of packets that have been dropped because they did not pass dynamic arp inspection (DIA).

Appendix A spanning-tree Commands

The following lists the spanning-tree command aliases for the SWMRE `bridge` and `bridge-group` commands.

- spanning-tree ageing-time <10-1000000>
- no spanning-tree ageing-time
- spanning-tree cisco-interoperability (enable | disable)
- spanning-tree enable
- spanning-tree errdisable-timeout enable
- no spanning-tree errdisable-timeout enable
- spanning-tree errdisable-timeout interval <10-1000000>
- no spanning-tree errdisable-timeout interval
- spanning-tree force-version <0-3>
- no spanning-tree force-version
- spanning-tree forward-time <4-30>
- no spanning-tree forward-time
- spanning-tree hello-time <1-10>
- no spanning-tree hello-time
- spanning-tree instance <1-63>
- no spanning-tree instance <1-63>
- spanning-tree instance <1-63> path-cost <1-200000000>
- no spanning-tree instance <1-63> path-cost
- spanning-tree instance <1-63> priority <0-240>
- spanning-tree instance <1-63> priority <0-61440>
- no spanning-tree instance <1-63> priority
- spanning-tree max-age <6-40>
- no spanning-tree max-age
- spanning-tree max-hops <1-40>
- no spanning-tree max-hops <1-40>
- spanning-tree path-cost <1-200000000>
- no spanning-tree path-cost
- spanning-tree portfast bpdu-filter
- no spanning-tree portfast bpdu-filter
- spanning-tree portfast bpdu-guard
- no spanning-tree portfast bpdu-guard
- spanning-tree priority <0-61440>
- no spanning-tree priority
- spanning-tree shutdown

- no spanning-tree shutdown
- spanning-tree transmit-holdcount <1-10>

spanning-tree Commands

- no spanning-tree transmit-holdcount
- spanning-tree vlan <2-4094>
- no spanning-tree vlan <2-4094>
- spanning-tree vlan <2-4094> path-cost <1-200000000>
- no spanning-tree vlan <2-4094> path-cost
- spanning-tree vlan <2-4094> priority <0-240>
- spanning-tree vlan <2-4094> priority <0-61440>
- no spanning-tree vlan <2-4094> priority

CHAPTER 1 BGP

This chapter contains basic Border Gateway Protocol configuration examples.

For details about the commands used in these examples, see the *Border Gateway Protocol Command Reference*.

Enable BGP Routers in the Same Autonomous System

Figure 1-72 shows the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS200, connecting to network 10.10.10.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

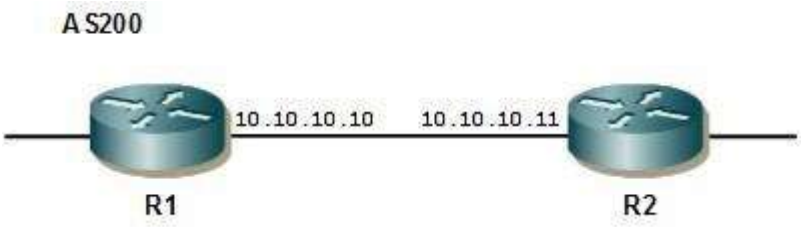

Figure 1-72: Routers in the Same Autonomous System

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R1.
`(config-router)#neighbor 10.10.10.11 remoteas 200`	Define BGP neighbors, and establish a TCP session. `10.10.10.11` is the IP address of the neighbor (R2), and `200` is the neighbor's AS number.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of `R2`.
`(config-router)#neighbor 10.10.10.10 remoteas 200`	Define BGP neighbors, and establish a TCP session. `10.10.10.10` is the IP address of the neighbor (`R1`), and `200` is the neighbor's AS number.

Validation

```
#sh ip bgp summary
BGP router identifier 192.168.56.101, local AS number 200
BGP table version is 1
0 BGP AS-PATH entries
0 BGP community entries
```

```
Neighbor                 V    AS    MsgRcv     MsgSen TblVer    InQ    OutQ    Up/

  BGP state = Established, up for 00:01:01
  Last read 00:01:01, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
  Received 389 messages, 0 notifications, 0 in queue
  Sent 391 messages, 1 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5
 seconds For address family: IPv4 IPv4
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

 Connections established 2; dropped 1 Local
host: 10.10.10.10, Local port: 50322 Foreign
host: 10.10.10.11, Foreign port: 179
Nexthop: 10.10.10.10
Nexthop global: fe80::a00:27ff:fe21:7ed2
Nexthop local: ::
BGP connection: non shared network
Last Reset: 02:23:59, due to BGP Notification sent
Notification Error Message: (Hold Timer Expired/Unspecified Error Subcode)
```

Enable BGP Between Different Autonomous Systems

This example shows the minimum configuration required for enabling BGP on an interface, when the routers belong to different autonomous systems. R1 and R2 are two routers in different autonomous system, AS200 and AS300, connecting to network 10.10.10.0/24.

Topology

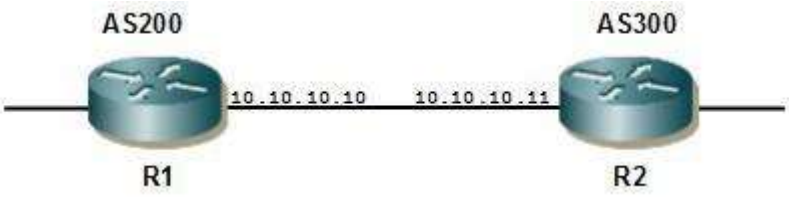

Figure 1-73: Routers in Different Autonomous Systems

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R1.
`(config-router)#neighbor 10.10.10.11 remoteas 300`	Define BGP neighbors, and establish a TCP session. `10.10.10.11` is the IP address of the neighbor (R2), and `300` is the neighbor's AS number.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 300`	Define the routing process. The number `300` specifies the AS number of `R2`.
`(config-router)#neighbor 10.10.10.10 remoteas 200`	Define BGP neighbors, and establish a TCP session. `10.10.10.10` is the IP address of the neighbor (R1), and `200` is the neighbor's AS number.

Validation

```
#sh ip bgp neighbors
BGP neighbor is 10.10.10.10, remote AS 200, local AS 300, external link
  BGP version 4, remote router ID 192.168.56.101
  BGP state = Established, up for 00:00:13
  Last read 00:00:13, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
  Received 2 messages, 0 notifications, 0 in queue
  Sent 2 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30
 seconds For address family: IPv4 IPv4
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

 Connections established 1; dropped 0 Local
host: 10.10.10.11, Local port: 53545 Foreign
host: 10.10.10.10, Foreign port: 179
Nexthop: 10.10.10.11
```

```
Nexthop global: fe80::a00:27ff:fe50:6a9b
Nexthop local: ::
BGP connection: non shared network

#sh ip bgp summary
BGP router identifier 192.168.56.102, local AS number 300
BGP table version is 1

Total number of neighbors 1

Total number of Established sessions 1
```

Route-Map

Use route maps to filter incoming updates from a BGP peer. In this example, the prefix-list `ABC` on R1 is configured to deny entry of any routes with the IP address 1.1.1.0/M (M = 26, 27, 28). To test the filter, R2 is configured to generate network addresses 1.1.1.0/27 and 1.1.2.0/24. To verify, use the `show ip bgp` command on R1; it displays R1 receiving updates from only 1.1.2.0/24.

Topology

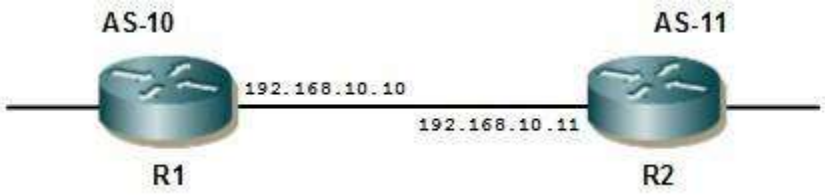

Figure 1-74: Configure Route-Map

R1

`#configure terminal`	Enter Configure mode.
`(config)#ip prefix-list ABC seq 5 deny 1.1.1.0/24 ge 26 le 28`	Create an entry in the prefix-list. The `ABC` parameter is the name of the map that is created above. `5` specifies the sequence number or position of this specific route map. `deny` specifies the packets are to be rejected. `26` and `28` are the minimum and maximum prefix lengths to be matched.
`(config)#ip prefix-list ABC seq 10 permit any`	Create another entry in the `ABC` map. `10` specifies the sequence number or position of this specific route map. The `permit` parameter `any` specifies accept all packets of any length.
`(config)#route-map ABC permit 1`	Enter Route-map mode to set the match operation.

(config-route-map)#match ip address prefixlist ABC	Set the match criteria. In this case, if the route-map name matches ABC, the packets from the first sequence are denied.
(config-route-map)#exit	Exit Route-map mode, and return to Configure mode.
(config)#router bgp 10	Define the routing process, and establish a TCP session. The number 10 specifies the AS number of R1.
(config-router)#neighbor 192.168.10.11 remote-as 11	Define BGP neighbors, and establish a TCP session. 192.168.10.11 is the IP address of the neighbor (R2), and 11 is the neighbor's AS number.
#configure terminal	Enter Configure mode.
(config)#ip prefix-list ABC seq 5 deny 1.1.1.0/24 ge 26 le 28	Create an entry in the prefix-list. The ABC parameter is the name of the map that is created above. 5 specifies the sequence number or position of this specific route map. deny specifies the packets are to be rejected. 26 and 28 are the minimum and maximum prefix lengths to be matched.
(config)#ip prefix-list ABC seq 10 permit any	Create another entry in the ABC map. 10 specifies the sequence number or position of this specific route map. The permit parameter any specifies accept all packets of any length.
(config)#route-map ABC permit 1	Enter Route-map mode to set the match operation.
(config-route-map)#match ip address prefixlist ABC	Set the match criteria. In this case, if the route-map name matches ABC, the packets from the first sequence are denied.
(config-route-map)#exit	Exit Route-map mode, and return to Configure mode.
(config-router)#neighbor 192.168.10.11 routemap ABC in	Apply a route map to routes. 192.168.10.11 specifies the IP address of BGP neighbor. The ABC parameter is the name of the route map, and in specifies that the access list applies to incoming advertisements.
(config-router)#exit	Exit router mode.

R2

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 1.1.1.1/27	Specify the interface address.
(config-if)#ip address 1.1.2.1/24	Specify the interface address.
(config-if)#exit	Exit loopback interface mode.
(config)#router bgp 11	Define the routing process, and establish a TCP session. The number 11 specifies the AS number of R2.
(config-router)#neighbor 192.168.10.10 remote-as 10	Define BGP neighbors, and establish a TCP session. 192.168.10.10 is the IP address of the neighbor (R1), and 10 is the neighbor's AS number.
(config-router)#network 1.1.1.0/27	Specify the network to be advertised by the BGP routing process.
(config-router)#network 1.1.2.0/24	Specify the network to be advertised by the BGP routing process.

`(config-router)#exit`	Exit router mode.

Validation

```
#sh ip bgp
BGP table version is 9, local router ID is 1.1.1.1
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal,
l - labeled               S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

1.1.2.0/24        10.20.30.2           0        100          0      11 i

Total number of prefixes 1
```

Route Reflector

The configurations in this section apply to BGP Route Reflectors (RR).

Reduce the iBGP Mesh Inside an Autonomous System

Use Route Reflectors to reduce the iBGP mesh inside an Autonomous System (AS).

Topology

In this example, R2, R5, and R4 would have to maintain a full mesh among themselves, but by making R5 the Route Reflector, R2 (Client1) has an iBGP session with the RR only, but not with R4 (Client 2). The routes learned from R2 are advertised to the other clients, and to iBGP peers outside the cluster; the iBGP routes learned from iBGP peers outside the cluster are advertised to R2. This reduces the iBGP peer connections in AS1.

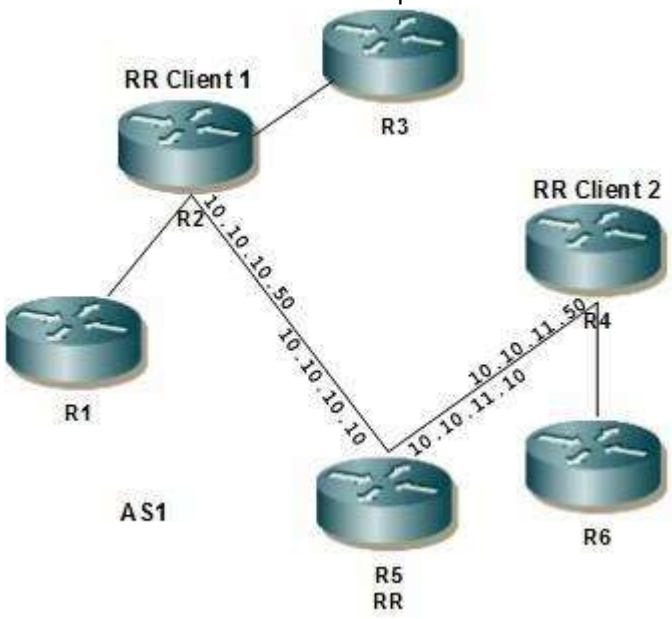

Figure 1-75: BGP Route Reflector

RR (R5)

#configure terminal	Enter Configure mode.
(config)#router bgp 1	Define the routing process. The number 1 identifies the AS number of R5.
(config-router)#neighbor 10.10.10.50 remoteas 1	Define the BGP neighbor, and establish a TCP session. 10.10.10.50 is the IP address of one of the neighbors (R2), and 1 is the neighbor's AS number.
(config-router)#neighbor 10.10.10.50 routereflector-client	Configure R5 as the Route-Reflector (RR) and neighbor R2 as its client.
(config-router)#neighbor 10.10.11.50 remoteas 1	Define the BGP neighbor, and establish a TCP session. 10.10.11.50 is the IP address of one of the neighbors (R4), and 1 is the neighbor's AS number.
(config-router)#neighbor 10.10.11.50 routereflector-client	Configure R5 as the Route-Reflector (RR) and neighbor R4 as its client.
(config-router)#exit	Exit router mode.

RR Client 1 (R2)

(config)#router bgp 1	Define the routing process. The number 1 specifies the AS number of R2.
(config-router)#neighbor 10.10.10.10 remoteas 1	Define the BGP neighbor, and establish a TCP session. 10.10.10.10 is the IP address of the neighbor (R5), and 1 is the neighbor's AS number.
(config-router)#exit	Exit router mode.

RR Client 2 (R4)

(config)#router bgp 1	Define the routing process. The number 1 identifies the AS number of R4.
(config-router)#neighbor 10.10.11.10 remoteas 1	Define BGP neighbor, and establish a TCP session. 10.10.11.10 is the IP address of the neighbor (R5), and 1 is the neighbor's AS number.
(config-router)#exit	Exit router mode.

Validation

Multiple Route Reflectors

The basic rule of BGP is that a BGP speaker cannot advertise a route to an iBGP neighbor if that route was learned from another iBGP neighbor. Configuring a route reflector provides a means to circumvent this rule. The entire route reflector process is transparent to the clients, and no configuration is necessary on these clients.

Whenever an iBGP-speaking router receives a route update, it forwards the route to the neighbor without changing the nexthop IP address, thus making it an unreachable route, unless verified by an iGP (for example, neighbor x.x.x.x route-reflector-client).

- If a router is configured as a Route Reflector, it forwards the routes received by changing the nexthop address as itself, thus making the nexthop reachable.
- If a route is received from a client, the route is forwarded to the clients.
- If a route is received from a non-client, the route is forwarded to the clients and non-clients.

Topology

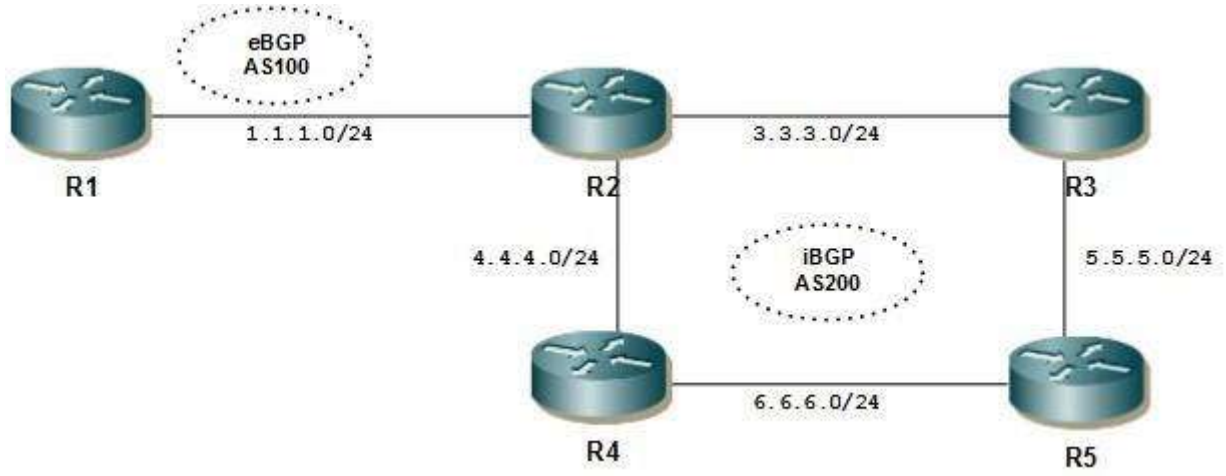

Figure 1-76: eBGP and iBGP Route Reflector Topology

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 100.100.100.100/32`	Specify IP address for the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 100`	Define the routing process with AS number `100`.
`(config-router)#neighbor 1.1.1.2 remote-as 200`	Define the eBGP neighbor (R2).
`(config-router)#network 100.100.100.100/32`	Advertise a route via eBGP connection to R2.
`(config-router)#exit`	Exit router mode.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process with AS number `200`.

(config-router)#neighbor 1.1.1.1 remote-as 100	Define the eBGP neighbor (R1).
(config-router)#neighbor 4.4.4.1 remote-as 200	Define the iBGP neighbor (R4).
(config-router)#neighbor 3.3.3.1 remote-as 200	Define the iBGP neighbor (R3).
(config-router)#bgp cluster-id 4	Define a cluster ID (4) when multiple Route Reflectors exist.
(config-router)#neighbor 3.3.3.1 routereflector-client	Configure R2 as the Route-Reflector and neighbor R3 as its client.
(config-router)#neighbor 4.4.4.1 routereflector-client	Configure R2 as the Route-Reflector and neighbor R4 as its client.
(config-router)#exit	Exit router mode.

R3

#configure terminal	Enter Configure mode.
(config)#router bgp 200	Define the routing process with AS number 200.
(config-router)#neighbor 3.3.3.2 remote-as 200	Define the iBGP neighbor (R2).
(config-router)#neighbor 5.5.5.2 remote-as 200	Define the iBGP neighbor (R5).
(config-router)#neighbor 5.5.5.2 routereflector-client	Configure R3 as the Route-Reflector and neighbor R5 as its client.
(config-router)#exit	Exit router mode.

R4

#configure terminal	Enter Configure mode.
(config)#router bgp 200	Define the routing process with AS number 200.
(config-router)#neighbor 4.4.4.2 remote-as 200	Define the iBGP neighbor (R2).
(config-router)#neighbor 6.6.6.2 remote-as 200	Define the iBGP neighbor (R5).
(config-router)#exit	Exit router mode.

R5

#configure terminal	Enter Configure mode.
(config)#router bgp 200	Define the routing process with AS number 200.
(config-router)#neighbor 5.5.5.1 remote-as 200	Define the iBGP neighbor (R3).
(config-router)#neighbor 6.6.6.1 remote-as 200	Define the iBGP neighbor (R4).
(config-router)#exit	Exit router mode.

Validation

R2

```
    #sh ip bgp neighbors
    BGP neighbor is 1.1.1.1, remote AS 100, local AS 200, external link

BGP Confederations

In BGP, nodes running iBGP protocols must be interconnected forming a full mesh. Confederation solves the iBGP fullmesh network complexity and inefficiency by splitting a large autonomous system domain into smaller autonomous system domains, called member autonomous systems. Member autonomous systems can form eBGP connections among themselves, to prevent full-mesh connections among each iBGP-running node.

The `bgp confederation identifier` command tells the router that it is a member of a confederation and the confederation ID. The `bgp confederation peers` command lists the member AS to which the router is connected.

In the following example, R1, R2, and R3 are members of the same confederation with different AS numbers.

Topology

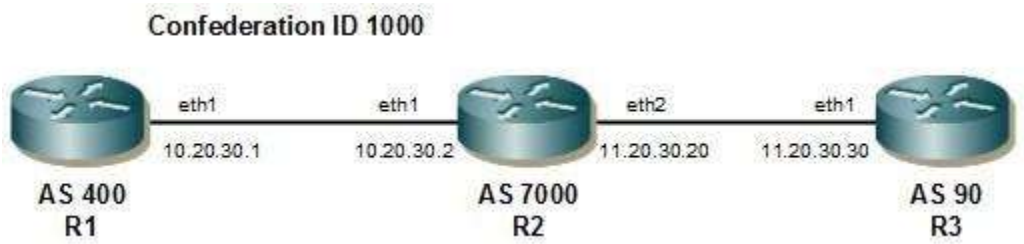

Figure 1-77: BGP Confederation

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 400`	Assign the ASN value (`400`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID, the externally visible autonomous system number that identifies the BGP confederation as a whole.
`(config-router)#bgp confederation peers 7000`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 10.20.30.2 remote-as 7000`	Specify the neighbor's IP address (`10.20.30.2`) and the ASN value of the neighbor (`7000`).
`(config-router)#end`	Exit router and configure mode

R2

`#configure terminal`	Enter Configure mode.

(config)#router bgp 7000	Assign the ASN value (7000) to the router.
(config-router)#bgp confederation identifier 1000	Specify the BGP confederation ID.
(config-router)#bgp confederation peers 400 90	Specify the neighbor ASN values for confederation membership.
(config-router)#neighbor 10.20.30.1 remote-as 400	Specify the neighbor's IP address (10.20.30.1) and the ASN value of the neighbor (400).
(config-router)#neighbor 11.20.30.30 remoteas 90	Specify the neighbor's IP address (11.20.30.30) and the ASN value of the neighbor (90).
(config-router)#end	Exit router and configure mode

R3

#configure terminal	Enter Configure mode.
(config-router)#router bgp 90	Assign the ASN value (90) to the router.
(config-router)#bgp confederation identifier 1000	Specify the BGP confederation ID.
(config-router)#bgp confederation peers 7000	Specify the neighbor ASN value for confederation membership.
(config-router)#neighbor 11.20.30.20 remote-as 7000	Specify the neighbor's IP address (11.20.30.20) and the ASN value of the neighbor (7000).
(config-router)#end	Exit router and configure mode

Multiple Autonomous Systems

In the following example, R1 and R2 are members of the same confederation with the same AS numbers, and R3 is a member of the same confederation with a different AS number.

Topology

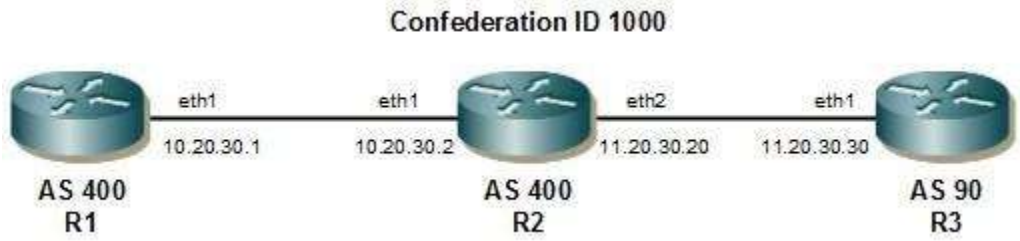

Figure 1-78: BGP Confederation with Multiple AS

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 400`	Assign the ASN value (`400`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#neighbor 10.20.30.2 remote-as 400`	Specify the neighbor's IP address (`10.20.30.2`) and the ASN value of the neighbor (`400`).

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 400`	Assign the ASN value (`400`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 90`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 10.20.30.1 remote-as 400`	Specify the neighbor's IP address (`10.20.30.1`) and the ASN value of the neighbor (`400`).
`(config-router)#neighbor 11.20.30.30 remoteas 90`	Specify the neighbor's IP address (`11.20.30.30`) and the ASN value of the neighbor (`90`).

R3

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 90`	Assign the ASN value (`90`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 400`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 11.20.30.20 remoteas 400`	Specify the neighbor's IP address (`11.20.30.20`) and the ASN value of the neighbor (`400`).

Outside Autonomous System

In the following example, R1 and R2 are members of the same confederation with different AS numbers, and R3 is a member outside the confederation.

Topology

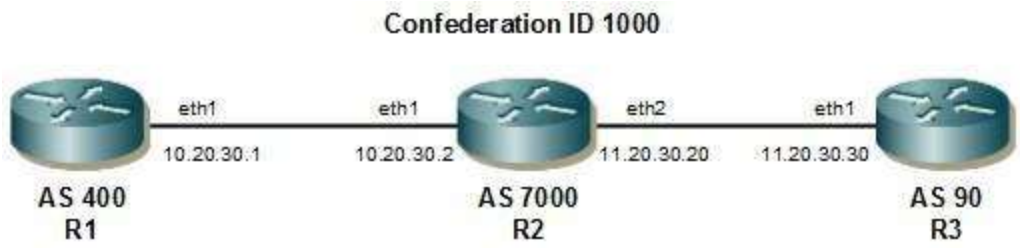

Figure 1-79: Single Confederation with Outside AS

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 400`	Assign the ASN value (`400`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 7000`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 10.20.30.2 remote-as 7000`	Specify the neighbor's IP address (`10.20.30.2`) and the ASN value of the neighbor (`7000`).

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 7000`	Assign the ASN value (`7000`) to the router.

`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 400`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 10.20.30.1 remote-as 400`	Specify the neighbor's IP address (`10.20.30.1`) and the ASN value of the neighbor (`400`).
`(config-router)#neighbor 11.20.30.30 remoteas 90`	Specify the neighbor's IP address (`11.20.30.30`) and the ASN value of the neighbor (`90`).

R3

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 90`	Assign the ASN value (`90`) to the router.
`(config-router)#neighbor 11.20.30.20 remote-as 1000`	Specify the neighbor's IP address (`11.20.30.20`) and the BGP confederation ID (`1000`).

BGP Authentication

BGP authentication allows users to receive selected routing information, enhancing security of their network traffic. When BGP authentication is enabled on a router, the router verifies routing packets it receives by exchanging a password that is configured on both the sending and receiving routers.

In this example, both R1 and R2 have `ABC` as the password. Configure the same password on all routers that are to communicate using BGP in a network.

Topology

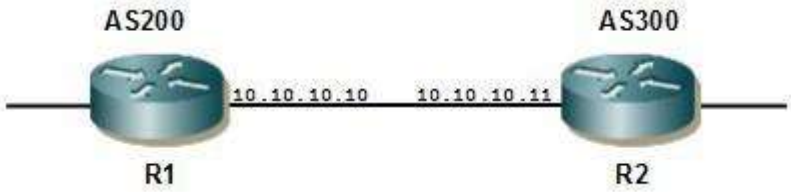

Figure 1-80: BGP Authentication

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R1.
`(config-router)#neighbor 10.10.10.11 remoteas 300`	Define BGP neighbors, and establish a TCP session. `10.10.10.11` is the IP address of the neighbor (R2), and `300` is the neighbor's AS number.
`(config-router)#neighbor 10.10.10.11 password ABC`	Specify the password.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 300`	Define the routing process. The number `300` specifies the AS number of R2.
`(config-router)#neighbor 10.10.10.10 remoteas 200`	Define BGP neighbors, and establish a TCP session. `10.10.10.10` is the IP address of the neighbor (R1), and `200` is the neighbor's AS number.
`(config-router)#neighbor 10.10.10.10 password ABC`	Specify the password.

Validation

```

Dynamic BGP Peering

BGP Dynamic Neighbors is a quick way of setting up BGP on device like a Hub router where user is expecting numerous BGP neighbors. Before dynamic neighbors, user had to provide a large amount of configuration to work with all these neighbors. This new feature dramatically reduces the amount and complexity of CLI configuration on the router and save CPU and memory usage.

BGP dynamic neighbor support allows BGP peering to a group of remote neighbors that are defined by a range of IP addresses. Each range can be configured as a subnet IP address. BGP dynamic neighbors are configured using a range of IP addresses and BGP peer groups.

After a subnet range is configured for a BGP peer group and a TCP session is initiated by another router for an IP address in the subnet range, a new BGP neighbor is dynamically created as a member of that group. After the initial configuration of subnet ranges and activation of the peer group, dynamic BGP neighbor creation does not require any further CLI configuration on the initial router. Other routers can establish a BGP session with the initial router, but the initial router need not establish a BGP session to other routers if the IP address of the remote peer used for the BGP session is not within the configured range.

A dynamic BGP neighbor will inherit any configuration for the peer group. In larger BGP networks, implementing BGP dynamic neighbors can reduce the amount and complexity of CLI configuration and save CPU and memory usage. Both IPv4 and IPV6 peering is supported.

IPv4 IBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11.11.11.0/24 and 11.11.12.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

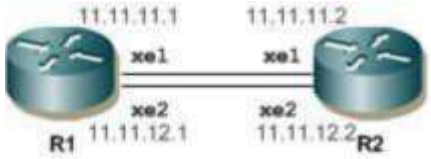

Figure 1-81: IPv4 IBGP Peering

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter Interface mode for loopback.
`(config-if)#ip address 33.33.33.33/32 secondary`	Assign a secondary IP address.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface xe1`	Enter Interface mode for xe1.
`(config-if)#ip address 11.11.11.1/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface xe2`	Enter Interface mode for xe2.

(config-if)#ip add 11.11.12.1/24	Assign IP address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 1.1.1.1	Assign a BGP router ID.
(config-router)#neighbor IPV4_IBGP_PEER peergroup range 11.11.0.0/16	Create a dynamic peer-group, IPV4_IBGP_PEER with a dynamic range 11.11.0.0/16
(config-router)#neighbor IPV4_IBGP_PEER remote-as 100	Assign a remote AS for the peer-group, IPV4_IBGP_PEER.
(config-router)#network 33.33.33.33/32	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

R2

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter Interface mode for loopback.
(config-if)#ip address 22.22.22.22/32	Assign a secondary IP address.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe1	Enter Interface mode for xe1.
(config-if)#ip address 11.11.11.2/24	Assign IP address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe2	Enter Interface mode for xe2.
(config-if)#ip add 11.11.12.2/24	Assign IP address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 2.2.2.2	Assign a BGP router ID.
(config-router)#neighbor 11.11.11.1 remote-as 100	Create a static BGP neighbor 11.11.11.1 in remote AS 100.
(config-router)#neighbor 11.11.12.1 remote-as 100	Create a static BGP neighbor 11.11.12.1 in remote AS 100.
(config-router)#network 22.22.22.22/32	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

IPv4 IBGP VRF Configuration

Below figure displays the minimum configuration required to enable BGP on an interface with vrf enabled on the device and interface being part of vrf. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11.11.11.0/24 and 11.11.12.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

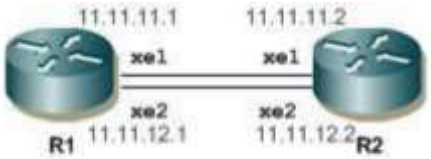

Figure 1-82: IPv4 VRF IBGP Peering

R1

#Configure terminal	Enter Configuration mode.
(config)#ip vrf vrfA	Create a VRF, vrfA on the router.
(config-vrf)#rd 1:1	Assign a route distinguisher to VRF.
(config-if)#exit	Exit VRF mode and return to Configure mode.
(config)#interface xe1	Enter Interface mode for xe1.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.

(config-if)#ip address 11.11.11.1/24	Assign IP address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe2	Enter Interface mode for xe2.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ip add 11.11.12.1/24	Assign IP address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 1.1.1.1	Assign a BGP router ID.
(config-router)#address-family ipv4 vrf	Enter IPv4 VRF Address Family.
(config-router)#neighbor IPV4_IBGP_PEER peergroup range 11.11.0.0/16	Create a dynamic peer-group, IPV4_IBGP_PEER with a dynamic range 11.11.0.0/16.
(config-router)#neighbor IPV4_IBGP_PEER remote-as 100	Assign a remote AS for the peer-group, IPV4_IBGP_PEER.
(config-router)#network 33.33.33.33/32	Advertise the loopback network into BGP
(config-router)#end	Exit from Router BGP mode.

R2

#configure terminal	Enter Configure mode.
(config)#ip vrf vrfA	Create a VRF, vrfA on router.
(config-vrf)#rd 2:1	Assign a route distinguisher to VRF.
(config-if)#exit	Exit VRF mode and return to Configure mode.
(config)#interface xe1	Enter Interface mode for xe1.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ip address 11.11.11.2/24	Assign IP address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe2	Enter Interface mode for xe2.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ip add 11.11.12.2/24	Assign IP address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 2.2.2.2	Assign a BGP router ID.
(config-router)#address-family ipv4 vrf vrfA	Enter IPv4 VRF Address Family.
(config-router)#neighbor 11.11.11.1 remote-as 100	Create a static BGP neighbor 11.11.11.1 in remote AS 100.
(config-router)#neighbor 11.11.12.1 remote-as 100	Create a static BGP neighbor 11.11.12.1 in remote AS 100
(config-router)#network 22.22.22.22/32	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

IPv4 EBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1, R2 and R3 are three routers belonging to the different AS, AS100 AS200 and AS300, connecting to network 11.11.11.0/24 and 11.11.12.0/ 24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

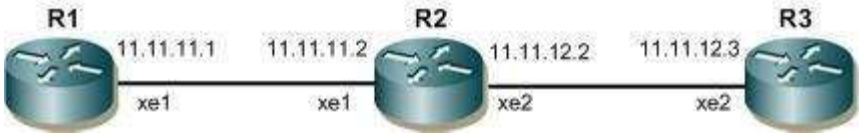

Figure 1-83: IPv4 EBGP Peering

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter Interface mode for loopback.
`(config-if)#ip address 33.33.33.33/32 secondary`	Assign a secondary IP address.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface xe1`	Enter Interface mode for xe1.
`(config-if)#ip address 11.11.11.1/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#bgp router-id 1.1.1.1`	Assign a BGP router ID.
`(config-router)#neighbor 11.11.11.2 remote-as 200`	Create a static neighbor 11.11.11.2 with remote AS 200.

(config-router)#network 33.33.33.33/32	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

R2

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter Interface mode for loopback.
(config-if)#ip address 22.22.22.22/32	Assign a secondary IP address.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe1	Enter Interface mode for xe1.
(config-if)#ip address 11.11.11.2/24	Assign IP address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe2	Enter Interface mode for xe2.
(config-if)#ip add 11.11.12.2/24	Assign IP address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 200	Enter Router BGP mode.
(config-router)#bgp router-id 2.2.2.2	Assign a BGP router ID.
(config-router)#neighbor IPV4_EBGP_PEER peer-group range 11.11.0.0/16	Create a dynamic peer-group, IPV4_EBGP_PEER.
(config-router)#neighbor IPV4_EBGP_PEER remote-as 100	Assign remote AS with the peer-group IPV4_EBGP_PEER.
(config-router)#neighbor IPV4_EBGP_PEER optional-as 300	Assign optional AS with the peer-group IPV4_EBGP_PEER
(config-router)#network 22.22.22.22/32	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

R3

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter Interface mode for loopback.
(config-if)#ip address 44.44.44.44/32	Assign a secondary IP address.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe2	Enter Interface mode for xe2.
(config-if)#ip add 11.11.12.3/24	Assign IP address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 300	Enter Router BGP mode.
(config-router)#bgp router-id 3.3.3.3	Assign a BGP router ID.
(config-router)#neighbor 11.11.12.2 remote-as 200	Create a static BGP neighbor 11.11.12.2 with remote AS 200.
(config-router)#network 44.44.44.44/32	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

IPv6 IBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11:11:11::1/64 and 11:11:12::1/64. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

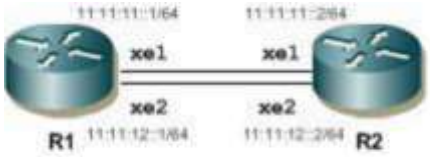

Figure 1-84: IPv6 IBGP Peering

R1

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter Interface mode for loopback.
(config-if)#(config-if)#ipv6 address 33::1/128	Assign an IPv6 address.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe1	Enter Interface mode for xe1.
(config-if)#(config-if)#ipv6 address 11:11:11::1/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe2	Enter Interface mode for xe2.
(config-if)#ipv6 address 11:11:12::1/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 1.1.1.1	Assign a BGP router ID.
(config-router)#neighbor IPV6_IBGP_PEER peergroup range 11:11::/16	Create a dynamic peer-group, IPV6_IBGP_PEER with a dynamic range 11:11::/16
(config-router)#neighbor IPV6_IBGP_PEER remote-as 100	Configure a remote AS with the peer group, IPV6_IBGP_PEER.
(config-router)#neighbor IPV6_IBGP_PEER limit 1	Set peer group neighbors limit to 1. Only one BGP session will be up.
(config-router)#address-family ipv6 unicast	Enter the IPv6 Unicast Address Family.
(config-router-af)#neighbor IPV6_IBGP_PEER activate	Activate the peer group, IPV6_IBGP_PEER in the IPv6 address family.
(config-router-af)#network 33::1/128	Advertise the loopback network into the BGP IPv6 address family.
(config-router-af)#end	Exit from Router BGP address family mode.

R2

#Configure terminal	Enter Configuration mode.
(config)#interface lo	Enter Interface mode for loopback.
(config-if)#ipv6 address 22::2/128	Assign an IPv6 address.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe1	Enter Interface mode for xe1.

(config-if)#ipv6 address 22::2/128	Assign an IPv6 address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe1	Enter Interface mode for xe1.
(config-if)#ipv6 address 11:11:11::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe2	Enter Interface mode for xe2.
(config-if)#ipv6 address 11:11:12::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 2.2.2.2	Assign a BGP router ID.
(config-router)#neighbor 11:11:11::1 remoteas 100	Configure BGP neighbor by specifying the neighbor IP address.
(config-router)#neighbor 11:11:12::1 remoteas 100	Configure BGP neighbor by specifying the neighbor IP address.
(config-router)#address-family ipv6 unicast	Enter the IPv6 Unicast Address Family.
(config-router-af)#network 22::2/128	Advertise the loopback network into BGP.
(config-router-af)#neighbor 11:11:12::1 activate	Activate the neighbor in the IPv6 address family.
(config-router-af)#neighbor 11:11:11::1 activate	Activate the neighbor in the IPv6 address family.
(config-router-af)#end	Exit from Router BGP address family mode.

IPV6 IBGP VRF Configuration

Below figure displays the minimum configuration required to enable BGP on an interface with VRF enabled on the device and interface being part of VRF. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11:11:11::1 and 11:11:12::1. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

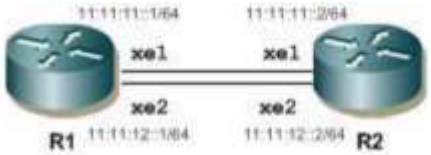

Figure 1-85: IPv6 VRF IBGP peering

R1

`#Configure terminal`	Enter Configuration mode.

(config)#ip vrf vrfA	Configure a VRF, vrfA.
(config-vrf)#rd 1:1	Configure a route distinguisher to VRF.
(config-vrf)#router-id 7.7.7.7	Configure a router ID.
(config-vrf)#exit	Exit from VRF mode and return to Configuration mode.
(config)#interface xe1	Enter Interface mode for xe1.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ipv6 address 11:11:11::1/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe2	Enter Interface mode for xe2.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ipv6 address 11:11:12::1/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#address-family ipv6 vrf	Enter IPv6 VRF Address Family.
(config-router-af)#neighbor IPV6 VRF IBGP PEER peer-group range 11:11::1/16	Configure a dynamic peer group, IPV6_IBGP_PEER with a dynamic range value.
(config-router-af)#neighbor IPV6 VRF IBGP PEER remote-as 100	Configure a remote AS with the peer group, IPV6_IBGP_PEER.
(config-router)#end	Exit from Router BGP mode.

R2

#configure terminal	Enter Configure mode.
(config)#ip vrf vrfA	Configure a VRF, vrfA.
(config-vrf)#rd 2:1	Configure a route distinguisher to VRF.
(config-vrf)#router-id 1.1.1.1	Configure a router ID.
(config-vrf)#exit	Exit from VRF mode and return to Configuration mode.
(config)#interface xe1	Enter Interface mode for xe1.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ipv6 address 11:11:11::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe2	Enter Interface mode for xe2.
(config-if)# ip vrf forwarding vrfA	Assign IP address to vrf.
(config-if)#ipv6 address 11:11:12::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 100	Enter Router BGP mode
(config-router)#address-family ipv6 vrf vrfA	Enter IPv6 VRF Address Family.
(config-router-af)#neighbor 11:11:12::1 remote-as 100	Configure BGP neighbor by specifying the neighbor IP address.

(config-router-af)#neighbor 11:11:11::1 remote-as 100	Configure BGP neighbor by specifying the neighbor IP address.
(config-router)#end	Exit from Router BGP mode.

```

IPv6 EBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1, R2 and R3 are three routers belonging to the different AS, AS100 AS200 and AS300, connecting to network 11:11:11::/64 and 11:11:12::/64. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

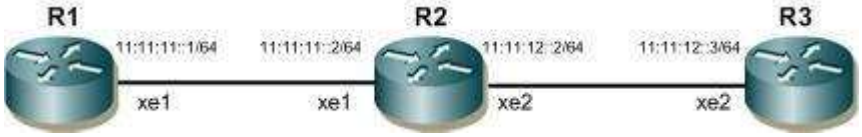

Figure 1-86: IPv6 EBGP peering

R1

`#configure terminal`	Enter Configuration mode.
`(config)#interface lo`	Enter Interface mode for loopback.
`(config-if)#ipv6 address 33::1/128`	Assign an IPv6 address.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface xe1`	Enter Interface mode for xe1.
`(config-if)#ipv6 address 11:11:11::1/64`	Assign an IPv6 address to the interface.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#bgp router-id 1.1.1.1`	Assign a BGP router ID.
`(config-router)#neighbor 11:11:11::2 remoteas 200`	Configure BGP neighbor by specifying the neighbor IP address.
`(config-router)#address-family ipv6 unicast`	Enter the IPv6 Unicast Address Family.
`(config-router-af)#neighbor 11:11:11::2 activate`	Activate the neighbor in the address family.
`(config-router-af)#network 33::1/128`	Advertise the loopback network into BGP.
`(config-router)#end`	Exit from Router BGP mode.

R2

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter Interface mode for loopback.
`(config-if)#ipv6 address 22::1/128`	Assign an IPv6 address.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface xe1`	Enter Interface mode for xe1
`(config-if)#ipv6 address 11:11:11::2/64`	Assign an IPv6 address to the interface.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface xe2`	Enter Interface mode for xe2.

(config-if)#ipv6 address 11:11:12::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 200	Enter Router BGP mode.
(config-router)#bgp router-id 2.2.2.2	Assign a BGP router ID.
(config-router)#neighbor IPV6_EBGP_PEER peer-group range 11::1/16	Configure a dynamic peer group, IPV6_EBGP_PEER.
(config-router)#neighbor IPV6_EBGP_PEER remote-as 100	Configure remote AS with peer group, IPV6_EBGP_PEER.
(config-router)#neighbor IPV6_EBGP_PEER optional-as 300	Configure optional AS with peer group, IPV6_EBGP_PEER.
(config-router)#address-family ipv6 unicast	Enter IPv6 Unicast Address Family.
(config-router-af)#neighbor IPV6_EBGP_PEER activate	Activate peer group in the address family.
(config-router-af)#network 22::1/128	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

R3

#Configure terminal	Enter Configuration mode.
(config)#interface lo	Enter Interface mode for loopback.
(config-if)#ipv6 address 44::1/128	Assign an IPv6 address.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface xe2	Enter Interface mode for xe2
(config-if)#ipv6 address 11:11:12::3/64	Assign an IPv6 address.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router bgp 300	Enter Router BGP mode.
(config-router)#bgp router-id 3.3.3.3	Assign a BGP router ID.
(config-router)#neighbor 11:11:12::2 remoteas 200	Configure the BGP neighbor by specifying the neighbor IP address.
(config-router)#address-family ipv6 unicast	Enter the IPv6 Unicast Address Family.
(config-router-af)#neighbor 11:11:12::2 activate	Activate the neighbor in address family.
(config-router-af)#network 44::1/128	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

VPNV4 Configuration

Below mentioned topology displays bgp vpnv4 configuration on PE nodes, R1 and R3. IBGP peering will be formed on the loopback interface of R1 and R3; also IGP is running between all the routers.

Topology

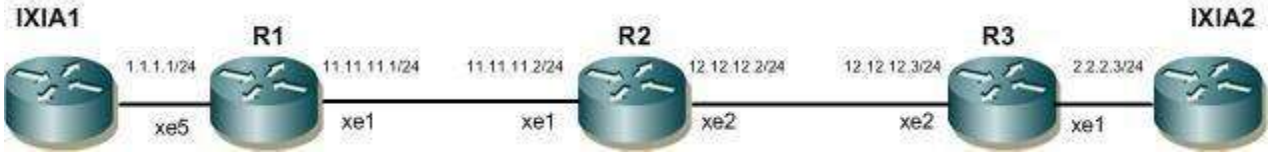

Figure 1-87: IPv4 IBGP VPNv4 Configuration

R1

`#Configure terminal`	Enter Configuration mode.
`(config)#ip vrf vrf1`	Create a VRF, vrf1.
`(config-vrf)#rd 100:1`	Configure a route distinguisher value.
`(config-vrf)#route-target export 100:1`	Configure a route target export value to VRF.
`(config-vrf)#route-target import 200:1`	Configure a route target import value to VRF.
`(config-vrf)#exit`	Exit from VRF configuration mode.
`(config)#router ldp`	Enter Router LDP mode.
`(config-router)#router-id 3.3.3.3`	Configure an LDP router ID.
`(config-router)#exit`	Exit from Router LDP mode.
`(config)#interface xe5`	Enter Interface configuration mode.
`(config-if)#ip vrf forwarding vrf1`	Configure the interface to a VRF.
`(config-if)#ip address 1.1.1.1/24`	Assign an IP address to the interface.
`(config-if)#exit`	Exit from Interface configuration mode.
`(config-if)#interface xe1`	Enter another interface.
`(config-if)#ip address 11.11.11.1/24`	Assign an IP address to the interface.
`(config-if)#label-switching`	Enable label switching on interface.
`(config-if)#enable-ldp ipv4`	Enable IPv4 LDP configuration on interface.
`(config-if)#exit`	Exit from Interface configuration mode.
`(config-if)#interface lo`	Enter the loopback interface.
`(config-if)#ip address 20.20.20.20/32 secondary`	Assign a secondary IP address to the interface.
`(config-if)#exit`	Exit from Interface Configuration mode.

(config)#router ospf 100	Enter Router OSPF mode.
(config-router)#network 11.11.11.0/24 area 0	Configure the interface on which OSPF runs, and associate the area ID.
(config-router)#network 20.20.20.20/32 area 0	Configure the interface on which OSPF runs, and associate the area ID.
(config-router)#exit	Exit from Router OSPF mode.
(config)#router ospf 200 vrf1	Create an OSPF process on VRF.
(config-router)#network 1.1.1.1/24 area 0	Configure the interface on which OSPF runs, and associate the area ID.
(config-router)#redistribute bgp	Redistribute BGP into OSPF.
(config-router)#exit	Exit from Router OSPF mode.
(config)#router bgp 100	Create a BGP process.
(config-router)#neighbor lo_peer peer-group range 30.30.30.30/32	Configure a dynamic peer group with the range command.
(config-router)#neighbor lo_peer remote-as 100	Configure remote AS to the peer group.
(config-router)#neighbor lo_peer updatesource lo	Configure BGP neighbors to update the source routes.
(config-router)#address-family vpnv4 unicast	Enter the VPNv4 Address Family.
(config-router-af)#neighbor lo_peer activate	Activate the peer group in VPNv4 address family.
(config-router-af)#exit-address-family	Exit from VPNv4 address family.
(config-router)#address-family ipv4 vrf vrf1	Enter IPv4 VRF address family.
(config-router-af)#redistribute ospf 200	Redistribute OSPF into the IPv4 VRF address family.
(config-router)#end	Exit from the Router BGP mode.

R2

#Configure terminal	Enter Configuration mode.
(config)#router ldp	Enter Router LDP mode.
(config-router)#router-id 4.4.4.4	Configure an LDP router ID.
(config-router)#exit	Exit from Router LDP mode.
(config-if)#interface xe2	Enter Interface Configuration mode.
(config-if)#ip address 12.12.12.2/24	Assign an IP address to the interface.
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.
(config-if)#exit	Exit from Interface configuration mode.
(config-if)#interface xe1	Enter another Interface.
(config-if)#ip address 11.11.11.2/24	Assign an IP address to the interface.
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.
(config-if)#exit	Exit from Interface mode.

(config)#router ospf 100	Create an OSPF process.
(config-router)#network 11.11.11.0/24 area	Define the interface on which OSPF runs, and associate the area ID
(config-router)#network 12.12.12.0/24 area 0	Define the interface on which OSPF runs, and associate the area ID
(config-router)#end	Exit from Router BGP mode.

R3

#Configure terminal	Enter Configuration mode.
(config)#router ldp	Enter Router LDP mode.
(config-router)#router-id 5.5.5.5	Configure an LDP router ID.
(config-router)#exit	Exit from Router LDP mode.
(config)#ip vrf vrf2	Create a VRF, vrf2.
(config-vrf)#rd 200:1	Configure a route distinguisher value.
(config-vrf)#route-target export 200:1	Configure a route target export value to VRF.
(config-vrf)#route-target import 100:1	Configure a route target import value to VRF.
(config-vrf)#exit	Exit from VRF configuration mode.
(config)#interface xe1	Enter Interface configuration mode.
(config-if)#ip vrf forwarding vrf2	Configure an interface to a VRF.
(config-if)#ip address 2.2.2.3/24	Assign an IP address to the interface.
(config-if)#exit	Exit from Interface configuration mode.
(config-if)#interface xe2	Enter another interface.
(config-if)#ip address 12.12.12.3/24	Assign an IP address to the interface.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.
(config-if)#exit	Exit from Interface configuration mode.
(config-if)#interface lo	Enter loopback interface.
(config-if)#ip address 30.30.30.30/32 se	Assign a secondary IP address to the interface.
(config-if)#exit	Exit from Interface mode.
(config)#router ospf 100	Enter Router OSPF mode.
(config-router)#network 12.12.12.0/24 area 0	Define the interface on which OSPF runs, and associate the area ID
(config-router)#network 30.30.30.30/32 area 0	Define the interface on which OSPF runs, and associate the area ID
(config-router)#exit	Exit from Router OSPF mode.
(config)#router ospf 200 vrf2	Create an OSPF process on VRF.
(config-router)#network 2.2.2.3/24 area 0	Define the interface on which OSPF runs, and associate the area ID.
(config-router)#redistribute bgp	Redistribute BGP into OSPF.

(config-router)#exit	Exit from Router OSPF mode.
(config)#router bgp 100	Create a BGP process.
(config-router)#neighbor 20.20.20.20 remoteas 100	Configure BGP neighbor by specifying a neighbor IP address.
(config-router)#neighbor 20.20.20.20 update-slo	Define the BGP neighbors to update the source routes.
(config-router)#address-family vpnv4 unicast	Enter VPNv4 Address Family.
(config-router-af)#neighbor 20.20.20.20 act	Activate the neighbor in VPNv4 address family.
(config-router-af)#exit-address-family	Exit from VPNv4 address family.
(config-router)#address-family ipv4 vrf vrf2	Enter IPv4 VRF address family.
(config-router-af)#redistribute ospf 200	Redistribute OSPF into the IPv4 address family.
(config-router)#end	Exit from Router BGP mode.

Enable eBGP Multihop

This example shows the minimum configuration required for enabling eBGP multihop on peers speaking BGP. eBGP multihop is used for routers that are not directly connected to each other. Typically, eBGP peers are directly connected, but if there is a requirement that necessitates this scenario, this configuration can be used.

Note: The IP addresses used in the configuration should be accessible through an IGP or static routing.

Topology

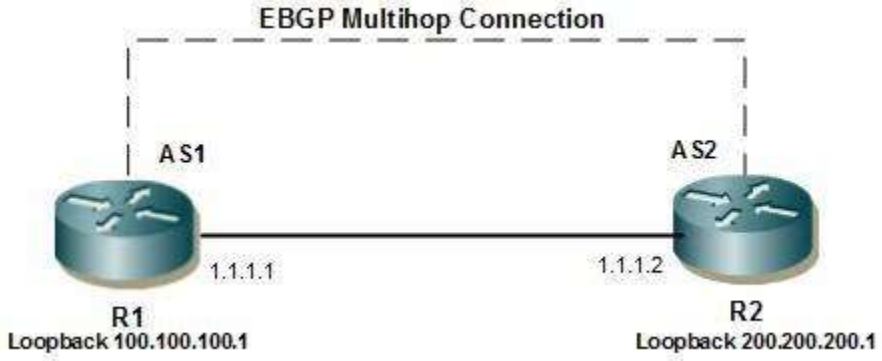

Figure 1-88: eBGP Multihop Connection

R1

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 100.100.100.1/24	Specify IP address to the interface.
(config-if)#exit	Exit loopback interface mode.
(config)#ip route 200.200.200.0/24 1.1.1.2	Specify route IP address.
(config)#router bgp 1	Define the routing process. The number 1 specifies the AS number of R1.
(config-router)#neighbor 200.200.200.1 remote-as 2	Define BGP neighbors, and establish a TCP session. 200.200.200.1 is the IP address of the neighbor (R2), and 100 is the neighbor's AS number.
(config-router)#neighbor 200.200.200.1 update-source lo	Define BGP neighbors, to update the source routes.
(config-router)#neighbor 200.200.200.1 ebgpmultihop	Define the neighbor 200.200.200.1 for eBGP multihops.
(config-router)#end	Exit BGP router mode.

R2

#configure terminal	Enter Configure mode.
(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 200.200.200.1/24	Specify IP address to the interface.
(config-if)#exit	Exit loopback interface mode.
(config)#ip route 100.100.100.0/24 1.1.1.1	Specify route IP address.
(config)#router bgp 2	Define the routing process. The number 2 specifies the AS number of R1.
(config-router)#neighbor 100.100.100.1 remote-as 1	Define BGP neighbors, and establish a TCP session. 100.100.100.1 is the IP address of the neighbor (R2), and 100 is the neighbor's AS number.
(config-router)#neighbor 100.100.100.1 update-source lo	Define BGP neighbors, to update the source routes.
(config-router)#neighbor 100.100.100.1 ebgpmultihop	Define the neighbor 100.100.100.1 for eBGP multihops.
(config-router)#end	Exit BGP router mode.

Validation

show ip bgp, show ip bgp neighbors

Enable Peer Groups

A BGP speaker might have the same update policies for a set of its peers. This is very useful if you have to change the update policies for all of the peers: Changing individual routers for separate policies can be very time-consuming, thus, peer groups play an important role in creating and assigning policies to a group of routers.

In the following scenario, R1, R2, and R3 belong to the same peer group. R4 and R1 are eBGP peers. R1 is the route reflector (configuration not shown), and R2 and R3 are in AS 200. R4 is in AS 100.

Topology

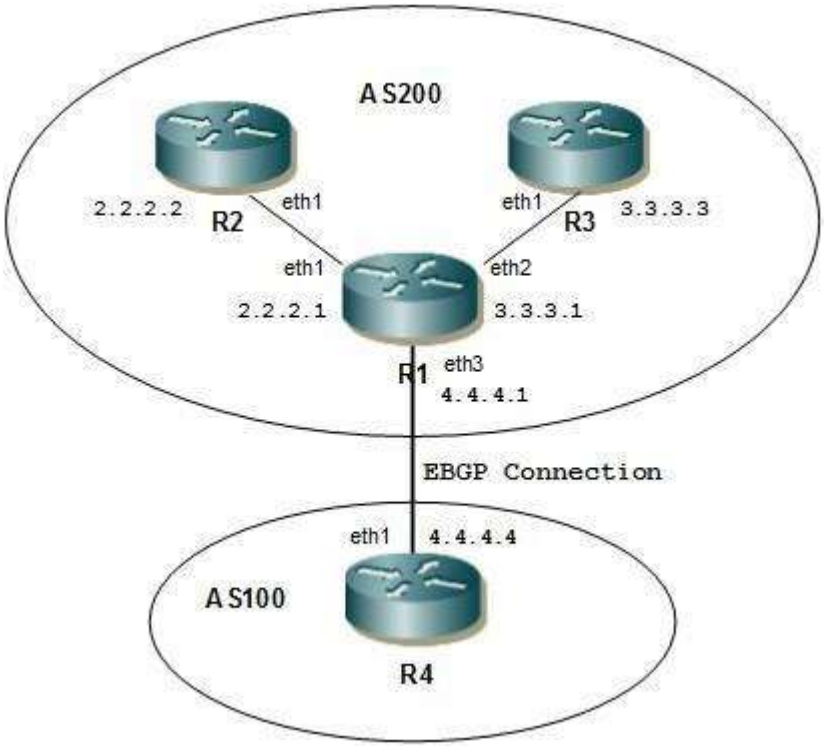

Figure 1-89: BGP Peer Groups

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R1.
`(config-router)#neighbor ABC peer-group`	Create a peer group named `ABC`.
`(config-router)#neighbor ABC remote-as 200`	Assign options to the peer group named `ABC`.
`(config-router)#neighbor 2.2.2.2 peer-group ABC`	Define neighbor `2.2.2.2` (`R2`) as a peer group member.
`(config-router)#neighbor 3.3.3.3 peer-group ABC`	Define neighbor `3.3.3.3` (`R3`) as a peer group member.
`(config-router)#neighbor 4.4.4.4 remote-as 100`	Define neighbor `4.4.4.4` (`R4`) is the IP address of R4 and 100 is the AS number.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R2.
`(config-router)#neighbor 2.2.2.1 remote-as 200`	Create a TCP connection with neighbor `2.2.2.1` of AS `200`.

R3

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R3.
`(config-router)#neighbor 3.3.3.1 remote-as 200`	Create a TCP connection with neighbor `3.3.3.1` of AS `200`.

R4

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Define the routing process. The number `100` specifies the AS number of R4.
`(config-router)#neighbor 4.4.4.1 remote-as 200`	Create a TCP connection with neighbor 4.4.4.1 of AS 200.

Route Redistribution in BGP

If there are routers that run both OSPF and BGP, certain OSPF routes might have to be sent to other eBGP peers. This can be achieved using the redistribution feature. Consider the following topology, in which R1 and R2 are eBGP peers, and R2 and R3 are OSPF peers. R2 is redistributing OSPF routes into BGP. The OSPF routes are sent to the R1 BGP routing table. This configuration assumes that all OSPF and eBGP sessions are up and running, and that only the redistribution must be configured.

Topology

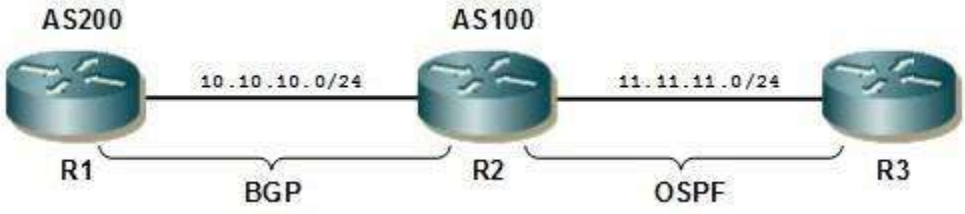

Figure 1-90: Redistribute with OSPF

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Define the routing process. The number `100` specifies the AS number of R2.
`(config-router)#redistribute ospf`	Redistribute OSPF routes in the R2 routing table into the R1 BGP routing table.
`(config-router)#exit`	Exit Router-BGP mode.

Validation

```

Add Multiple Instances of the Same Autonomous System

BGP supports adding the same AS number multiple times to influence the route selection process. This can be done using route maps, as described below.

Under normal circumstances, any route advertised by R1 is sent to R4 via two different routes, and then R4 selects the path from R2. This decision can be influenced by adding multiple instances of AS number 200 at R2.

Topology

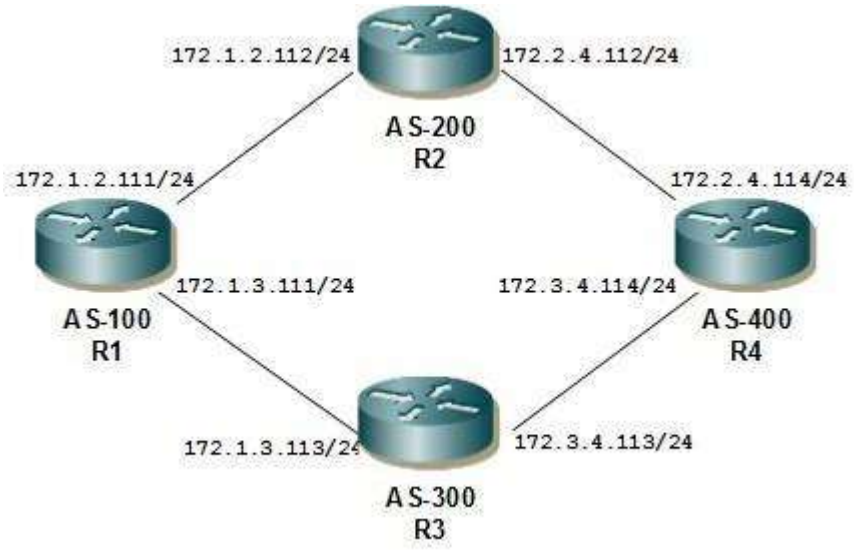

Figure 1-91: Multiple Instances of Same AS

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 44.44.44.1/24`	Specify the IP address for the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 100`	Define the routing process with AS number `100`.

(config-router)#neighbor 172.1.2.112 remoteas 200	Define neighbor R2. 172.1.2.112 is the IP address of R2, and 200 is the AS number.
(config-router)#neighbor 172.1.3.113 remoteas 300	Define neighbor R3. 172.1.3.113 is the IP address of R2, and 300 is the AS number.
(config-router)#network 44.44.44.0/24	Advertise network 44.44.44.0/24 through BGP. This route reaches R4 via R2 and R3.

R2

#configure terminal	Enter Configure mode.
(config)#route-map mul_inst permit 10	Define the route-map multiple instance with permit definition sequence number 10.
(config-route-map)#set as-path prepend 200 200	Prepend AS number 200 two times to the AS_PATH attribute in the BGP Update message.
(config-route-map)#exit	Exit Route-map mode, and return to Configure mode.
(config)#router bgp 200	Define the routing process with AS number 200.
(config-router)#neighbor 172.1.2.111 remoteas 100	Define neighbor R1. 172.1.2.111 is the IP address of R1, and 100 is the AS number.
(config-router)#neighbor 172.2.4.114 remoteas 400	Define neighbor R4. 172.2.4.114 is the IP address of R2, and 400 is the AS number.
(config-router)#neighbor 172.2.4.114 routemap mul_inst out	Apply route-map multi inst to all outbound routes to R4.

R3

#configure terminal	Enter Configure mode.
(config)#router bgp 300	Define the routing process with AS number 300.
(config-router)#neighbor 172.1.3.111 remoteas 100	Define neighbor R1. 172.1.3.111 is the IP address of R1, and 100 is the AS number.
(config-router)#neighbor 172.3.4.114 remoteas 400	Define neighbor R4. 172.3.4.114 is the IP address of R4, and 400 is the AS number.

R4

#configure terminal	Enter Configure mode.
(config)#router bgp 400	Define the routing process with AS number 400.
(config-router)#neighbor 172.2.4.112 remoteas 200	Define neighbor R2. 172.2.4.112 is the IP address of R2, and 200 is the AS number.
(config-router)#neighbor 172.3.4.113 remoteas 300	Define neighbor R3. 172.3.4.113 is the IP address of R3, and 300 is the AS number.

Remove the Multi-Exit Disc Attribute from Update Messages

You can remove the Multi-Exit Disc (MED) attribute values from received update messages.

Topology

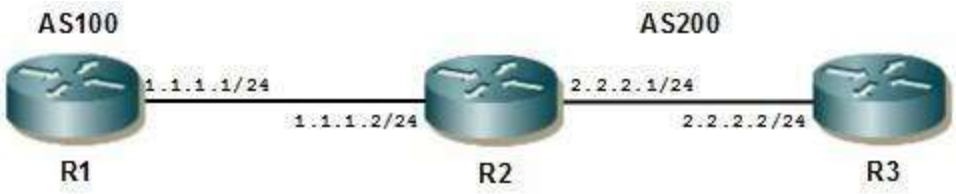

Figure 1-92: Remove MED Attribute

R1

`#configure terminal`	Enter Configure mode.
`(config)#route-map med permit 1`	Define the route-map MED with permit definition sequence number `1`.
`(config-route-map)#set metric 400`	Set the metric value.
`(config-route-map)#exit`	Exit Route-map mode, and return to Configure mode.
`(config)#router bgp 100`	Define the routing process with AS number `100`.
`(config-router)#neighbor 1.1.1.2 remote-as 200`	Define neighbor R2. `1.1.1.2` is the IP address of R2, and `200` is the AS number.
`(config-router)#neighbor 1.1.1.2 route-map med out`	Apply the route-map MED to all outbound routes to R2.

R3

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process with AS number `200`.
`(config-router)#neighbor 2.2.2.1 remote-as 200`	Define neighbor R2. `2.2.2.1` is the IP address of R2, and `200` is the AS number.

Removing Sent and Received MED values

The following describes how to remove the received and sent MED values, respectively.

R2 - Remove Received MED Value

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process with AS number `200`.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Define neighbor R1. `1.1.1.1` is the IP address of R1, and `100` is the AS number.

(config-router)#neighbor 2.2.2.2 remote-as 200	Define neighbor R3. 2.2.2.2 is the IP address of R3, and 200 is the AS number.
(config-router)#bgp bestpath med remove-recvmed	Enable the remove received MED value option.
R2 - Remove Send MED Value	
#configure terminal	Enter Configure mode.
(config)#router bgp 200	Define the routing process with AS number 200.
(config-router)#neighbor 1.1.1.1 remote-as 100	Define neighbor R1. 1.1.1.1 is the IP address of R1, and 100 is the AS number.
(config-router)#neighbor 2.2.2.2 remote-as 200	Define neighbor R3. 2.2.2.2 is the IP address of R3, and 200 is the AS number.
(config-router)#bgp bestpath med remove-sendmed	Enable the remove sent MED value option.

Validation

show ip bgp

BGP Four-Byte Autonomous System

Extended AS numbers can be mapped to 2-byte AS numbers if the value is less than, or equal to, 65535. If the AS number is higher than 65535, it cannot be mapped to a 2-byte AS number. Therefore, if a BGP speaker is configured with a non-mappable AS number, it must enable the BGP extended ASN capability in SWMRE.

Note: Autonomous System number 23456 is a reserved IANA number for AS transition; thus, it is recommended that no system be configured with 23456 as its AS number.

The extended ASN capability is disabled by default. However, when it is enabled, it is able to interoperate with a 2-byte AS-numbered speaker, in compliance with RFC 4893.

If a 4-byte AS number is configured in the provider's network using BGP MPLS VPN or standard IPv4/IPv6 BGP, it is recommended that the PE routers be 4-byte AS-enabled before connecting to 4-byte AS-enabled customer networks. For implications related to AS number transition issues, refer to RFC 4893.

You can also set up 4-byte AS-specific extended communities and route distinguishers (RDs) with limited capabilities. However, it is recommended that 2-byte AS-specific RDs and extended communities be used for regular deployment.

BGP encodes an ASN into four octets, so that more autonomous systems can be supported. Extended ASN capability is advertised in the Open message capabilities when the 4-octet ASN capability is enabled. When the 4-octet ASN capability is enabled, the valid ASN value range is <1-4294967295>, with the exception discussed in the first Note, above.

Note:Four-octet capability is disabled by default.

4-Octet ASN Capability Enabled on R1 and R2

In this example, 4-Octet ASN capability is enabled on BGP speakers R1 and R2.

Topology

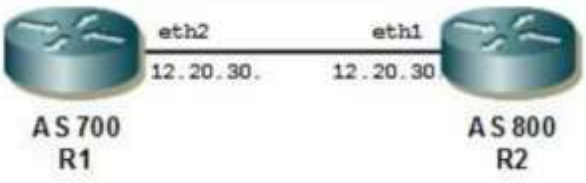

Figure 1-93: 4-Octet ASN on Both Routers

R1

`#configure terminal`	Enter Configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 400000`	Assign the ASN value (`400000`) to the router.
`(config-router)#neighbor 10.20.30.2 remote-as 7000`	Specify the neighbor's IP address (`10.20.30.2`) and the ASN value of the neighbor (`7000`).

R2

`#configure terminal`	Enter Configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 7000`	Assign the ASN value (`7000`) to the router.
`(config-router)#neighbor 10.20.30.1 remote-as 400000`	Specify the neighbor's IP address (`10.20.30.1`) and the ASN value of the neighbor (`400000`).

4-Octet ASN Capability Enabled on R1 and Disabled on R2

In the following two examples, 4-Octet ASN capability is enabled on BGP speaker R1 and disabled on R2.

Topology

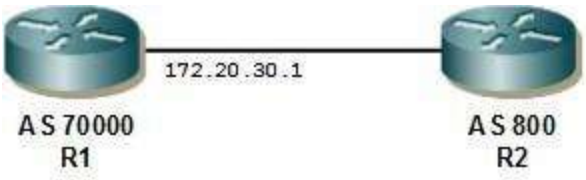

Figure 1-94: 4-Octet ASN on One Router

R1

`#configure terminal`	Enter Configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 70000`	Assign the ASN value (`70000`) to the router.
`(config-router)#neighbor 172.20.30.20 remoteas 800`	Specify the neighbor's IP address (`172.20.30.20`) and the ASN value of the neighbor (`800`).

R2

`#configure terminal`	Enter Configure mode.
`(config)#no bgp extended-asn-cap`	Disable 4-octet ASN capability.
`(config)#router bgp 800`	Assign the ASN value (`800`) to the router.
`(config-router)#neighbor 172.20.30.10 remoteas 23456`	Specify the neighbor's IP address (`172.20.30.10`) and the ASN value of the neighbor (`23456`).

Topology

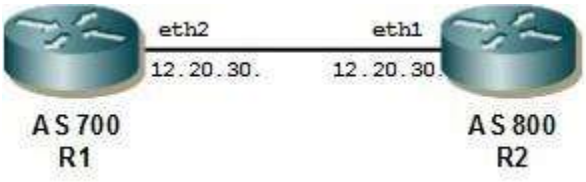

Figure 1-95: 4-Octet ASN

R1

`#configure terminal`	Enter Configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 700`	Assign the ASN value (`700`) to the router.
`(config-router)#neighbor 172.20.30.20 remoteas 800`	Specify the neighbor's IP address (`172.20.30.20`) and the ASN value of the neighbor (`800`).

R2

`#configure terminal`	Enter Configure mode.
`(config)#no bgp extended-asn-cap`	Disable 4-octet ASN capability.
`(config)#router bgp 800`	Assign the ASN value (`800`) to the router.
`(config-router)#neighbor 172.20.30.10 remoteas 700`	Specify the neighbor's IP address (`172.20.30.10`) and the ASN value of the neighbor (`700`).

BGP Extended Community Attribute

The Extended Community Attribute provides a mechanism for labeling information carried in BGP.

Extended Community with a 2-Byte ASN

In the following example, CE1, PE1, PE2, and CE2 are 2-byte-ASN capable, and do not support 4-byte-ASN capability.

Topology

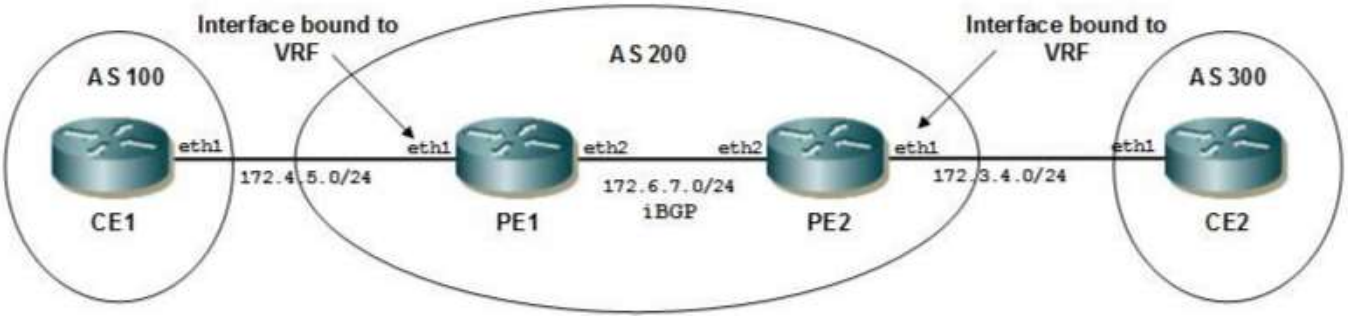

Figure 1-96: Extended Communities — 2-Byte ASN

CE1

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 172.4.5.115/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit Interface mode, and return to Configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 172.4.5.116 remoteas 200`	Specify the neighbor's IP address (`172.4.5.116`) and the ASN value of the neighbor (`200`).

CE2

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 172.3.4.114/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit Interface mode, and return to Configure mode.
`(config)#router bgp 300`	Assign the ASN value (`300`) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 172.3.4.117 remoteas 200`	Specify the neighbor's IP address (`172.3.4.117`) and the ASN value of the neighbor (`200`).

PE1

`#configure terminal`	Enter Configure mode.
`(config)#ip vrf VRF1`	Specify the name of the VRF (`VRF1`) to be created.
`(config-vrf)#rd 100:10`	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
`(config-vrf)#route-target both 100:10`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.

(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip vrf forwarding VRF1	Bind the interface (eth1) to the VRF (VRF1).
(config-if)#ip address 172.4.5.116/24	Configure the IP address on this interface
(config-if)#exit	Exit Interface mode, and return to Configure mode.
(config)#ip route vrf VRF1 75.1.1.0/24 eth1	Create a VRF static route.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ip address 172.6.7.116/24	Configure the IP address on this interface
(config-if)#exit	Exit Interface mode, and return to Configure mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)#neighbor 172.6.7.117 remoteas 200	Specify the neighbor's (PE2) IP address (172.6.7.117) and the ASN value of the neighbor (200). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
(config-router)#address-family vpnv4 unicast	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 172.6.7.117 activate	Enable the exchange of routing information with a peer router.
(config-router-af)#exit	Exit Address-Family-VPNv4 mode.
(config-router)#address-family ipv4 vrf VRF1	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
(config-router-af)#neighbor 172.4.5.115 remote-as 100	Specify the neighbor's (CE1) IP address and ASN value.
(config-router-af)#neighbor 172.4.5.115 sendcommunity both	Enable extended community attribute for the neighbor.
(config-router-af)#redistribute static	Configure static redistribution.
(config-router-af)#end	Exit Address-Family mode

PE2

`#configure terminal`	Enter Configure mode.
`(config)#ip vrf VRF1`	Specify the name of the VRF (`VRF1`) to be created.
`(config-vrf)#rd 100:10`	Assign a route distinguisher (RD) for the VRF.
`(config-vrf)#route-target both 100:10`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip vrf forwarding VRF1`	Bind the interface (eth1) to the VRF (`VRF1`).
`(config-if)#ip address 172.3.4.117/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit Interface mode, and return to Configure mode.
`(config)#ip route vrf VRF1 100.1.1.0/24 eth1`	Create a VRF static route.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)#ip address 172.6.7.117/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit Interface mode, and return to Configure mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.
`(config-router)#neighbor 172.6.7.116 remoteas 200`	Specify the neighbor's (PE1) IP address (`172.6.7.116`) and the ASN value of the neighbor (`200`). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
`(config-router)#address-family vpnv4 unicast`	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.
`(config-router-af)#neighbor 172.6.7.116 activate`	Enable the exchange of routing information with a peer router.
`(config-router-af)#exit`	Exit Address-Family-VPNv4 mode.
`(config-router)#address-family ipv4 vrf VRF1`	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
`(config-router-af)#neighbor 172.3.4.114 remote-as 300`	Specify the neighbor's (CE2) IP address and ASN value.
`(config-router-af)#neighbor 172.3.4.114 sendcommunity both`	Enable extended community attribute for the neighbor.
`(config-router-af)#redistribute static`	Configure static redistribution.
`(config-router-af)#end`	Exit Address-Family mode

Extended Community with a 4-Byte ASN

In the following example, CE1, PE1, PE2, and CE2 support 4-byte ASN capability.

Note: PE1 and PE2 should both either be 4-byte-ASN capable or 2-byte-ASN capable. Support for the combination of one 4-byte-ASN capable PE with one 2-byte-ASN-capable PE is currently unavailable.

Topology

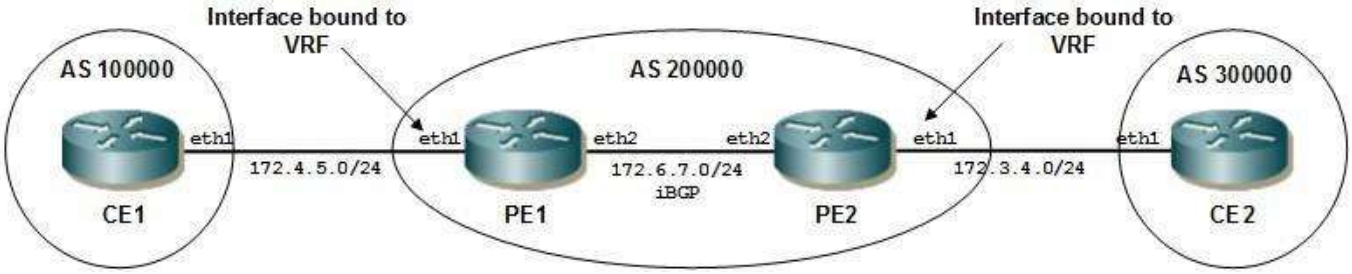

Figure 1-97: Extended Communities — 4-Byte ASN

CE1

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 172.4.5.115/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit Interface mode, and return to Configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 100000`	Assign the ASN value (`100000`) to the router. The ASN range is <1-4294967295>.
`(config-router)#neighbor 172.4.5.116 remoteas 200000`	Specify the neighbor's IP address (`172.4.5.116`) and the ASN value of the neighbor (`200000`).

PE1

`#configure terminal`	Enter Configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability. Dynamic change from 2byte to 4-byte capability, or vice versa, is not allowed, unless the VRF is removed.
`(config)#ip vrf VRF1`	Specify the name of the VRF (`VRF1`) to be created.
`(config-vrf)#rd 1.1.1.1:200`	Assign a 4-byte route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in A.B.C.D:NN format.
`(config-vrf)#route-target both 1.1.1.1:200`	Specify the 4-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip vrf forwarding VRF1`	Bind the interface (eth1) to the VRF (`VRF1`).

(config-if)#ip address 172.4.5.116/24	Configure the IP address on this interface
(config-if)#exit	Exit Interface mode, and return to Configure mode.
(config)#ip route vrf VRF1 50.1.1.0/24 eth1	Create a VRF static route.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ip address 172.6.7.116/24	Configure the IP address on this interface
(config-if)#exit	Exit Interface mode, and return to Configure mode.
(config)#router bgp 200000	Assign the ASN value (200000) to the router.
(config-router)#neighbor 172.6.7.117 remoteas 200000	Specify the neighbor's (PE2) IP address (172.6.7.117) and the ASN value of the neighbor (200000). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
(config-router)#address-family vpnv4 unicast	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 172.6.7.117 activate	Enable the exchange of routing information with a peer router.
(config-router-af)#exit	Exit Address-Family-VPNv4 mode.
(config-router)#address-family ipv4 vrf VRF1	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
(config-router-af)#neighbor 172.4.5.115 remote-as 100000	Specify the neighbor's (CE1) IP address and ASN value.
(config-router-af)#neighbor 172.4.5.115 sendcommunity both	Enable extended community attribute for the neighbor.
(config-router-af)#redistribute static	Configure static redistribution.
(config-router-af)#end	Exit Address-Family mode

PE2

#configure terminal	Enter Configure mode.
(config)#bgp extended-asn-cap	Enable 4-octet ASN capability. Dynamic change from 2byte to 4-byte capability, or vice versa, is not allowed, unless the VRF is removed.
(config)#ip vrf VRF1	Specify the name of the VRF (VRF1) to be created.
(config-vrf)#rd 1.1.1.1:200	Assign a 4-byte route distinguisher (RD) for the VRF.
(config-vrf)#route-target both 1.1.1.1:200	Specify the 4-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth1	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ip vrf forwarding VRF1	Bind the interface (eth1) to the VRF (VRF1).
(config-if)#ip address 172.3.4.117/24	Configure the IP address on this interface
(config-if)#exit	Exit Interface mode, and return to Configure mode.
(config)#ip route vrf VRF1 200.1.1.0/24 eth1	Create a VRF static route.

(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ip address 172.6.7.117/24	Configure the IP address on this interface
(config-if)#exit	Exit Interface mode, and return to Configure mode.
(config)#router bgp 200000	Assign the ASN value (200000) to the router.
(config-router)#neighbor 172.6.7.116 remoteas 200000	Specify the neighbor's (PE2) IP address (172.6.7.116) and the ASN value of the neighbor (200000). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
(config-router)#address-family vpnv4 unicast	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 172.6.7.116 activate	Enable the exchange of routing information with a peer router.
(config-router-af)#exit	Exit Address-Family-VPNv4 mode.
(config-router)#address-family ipv4 vrf VRF1	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
(config-router-af)#neighbor 172.3.4.114 remote-as 300000	Specify the neighbor's (CE1) IP address and ASN value.
(config-router-af)#neighbor 172.4.5.114 sendcommunity both	Enable extended community attribute for the neighbor.
(config-router-af)#redistribute static	Configure static redistribution.
(config-router-af)#end	Exit Address-Family mode

CE2

#configure terminal	Enter Configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip address 172.3.4.114/24	Configure the IP address on this interface
(config-if)#exit	Exit Interface mode, and return to Configure mode.
(config)#bgp extended-asn-cap	Enable 4-octet ASN capability.
(config)#router bgp 300000	Assign the ASN value (300000) to the router.
(config-router)#neighbor 172.3.4.117 remoteas 200000	Specify the neighbor's IP address (172.3.4.117) and the ASN value of the neighbor (200000).

Nexthop Tracking

Nexthop tracking is used to notify the BGP process asynchronously whenever there is any change in the IGP routes. It reduces the convergence time of BGP routes when IGP routes are changed.

Topology

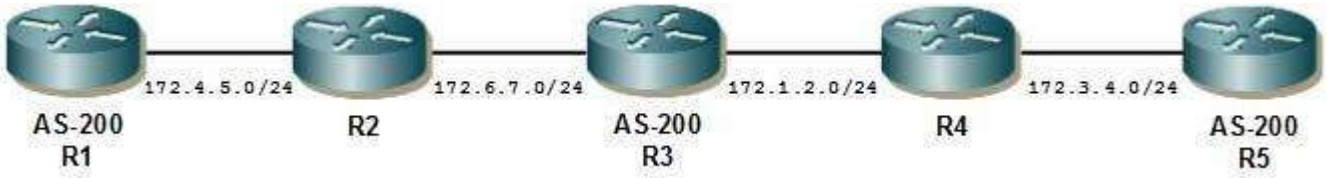

Figure 1-98: BGP Nexthop Tracking

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 100.100.100.100/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit Interface mode, and return to Configure mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 200.200.200.200 remote-as 200`	Specify the neighbor's IP address (`200.200.200.200`) and the ASN value of the neighbor (`200`).
`(config-router)#neighbor 200.200.200.200 update-source lo`	Specify the routing update source.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (`1`).
`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 100.100.100.100/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit Interface mode, and return to Configure mode.
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area `0`.
`(config-router)#redistribute connected`	Redistribute the connected routes.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (`1`).
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area `0`.
`(config-router)#network 172.6.7.0/24 area 0`	Advertise the network in Area `0`.

R3

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 200.200.200.200/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit Interface mode, and return to Configure mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.

(config-router)#neighbor 100.100.100.100 remote-as 200	Specify the neighbor's IP address (100.100.100.100) and the ASN value of the neighbor (200).
(config-router)#neighbor 100.100.100.100 update-source 200.200.200.200	Specify the routing update source.
(config-router)#neighbor 220.220.220.220 remote-as 200	Specify the neighbor's IP address (220.220.220.220) and the ASN value of the neighbor (200).
(config-router)#neighbor 220.220.220.220 update-source 150.150.150.150	Specify the routing update source.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#router ospf 1	Configure the OSPF process (1).
(config-router)#network 172.6.7.0/24 area 0	Advertise the network in Area 0.
(config-router)#network 172.1.2.0/24 area 0	Advertise the network in Area 0.
(config-router)#redistribute connected	Redistribute the connected routes.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#bgp nexthop-trigger enable	Enable Nexthop tracking.

R4

#configure terminal	Enter Configure mode.
(config)#router ospf 1	Configure the OSPF process (1).
(config-router)#network 172.1.2.0/24 area 0	Advertise the network in Area 0.
(config-router)#network 172.3.4.0/24 area 0	Advertise the network in Area 0.

R5

#configure terminal	Enter Configure mode.
(config)#interface lo	Specify the loopback interface, and enter Interface mode.
(config-if)#ip address 220.220.220.220/32	Configure the IP address on this interface.
(config-if)#exit	Exit Interface mode, and return to Configure mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)#neighbor 150.150.150.150 remote-as 200	Specify the neighbor's IP address (200.200.200.200) and the ASN value of the neighbor (200).
(config-router)#neighbor 150.150.150.150 update-source lo	Specify the routing update source.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#router ospf 1	Configure the OSPF process (1).
(config-router)#network 172.3.4.0/24 area 0	Advertise the network in Area 0.
(config-router)#redistribute connected	Redistribute the connected routes.

Validation

show ip bgp summary, show ip bgp neighbors, show ip bgp, show bgp nexthop-tracking, show ip bgp scan

Nexthop Tracking Delay Timer

The delay interval between routing table walks can be configured for nexthop delay tracking. This time determines how long BGP waits before it starts walking the full BGP routing table after receiving notification from NSM about a next-hop change.

Topology

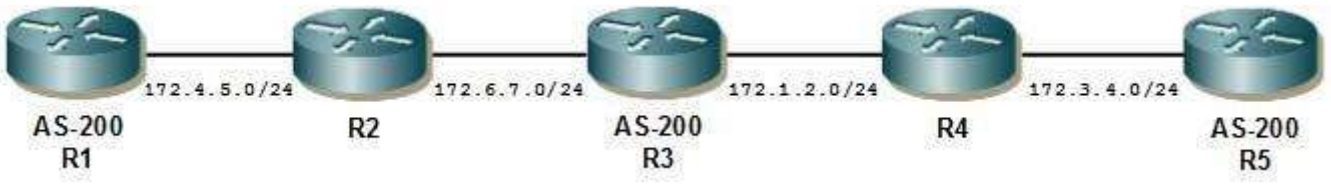

Figure 1-99: Topology for Nexthop Tracking Delay Timer

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 100.100.100.100/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit Interface mode, and return to Configure mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 200.200.200.200 remote-as 200`	Specify the neighbor's IP address (`200.200.200.200`) and the ASN value of the neighbor (`200`).
`(config-router)#neighbor 200.200.200.200 update-source lo`	Specify the routing update source.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (`1`).
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area `0`.
`(config-router)#redistribute connected`	Redistribute the connected routes.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (`1`).
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area `0`.
`(config-router)#network 172.6.7.0/24 area 0`	Advertise the network in Area `0`.

R3

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 200.200.200.200/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit Interface mode, and return to Configure mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.
`(config-router)#neighbor 100.100.100.100 remote-as 200`	Specify the neighbor's IP address (`100.100.100.100`) and the ASN value of the neighbor (`200`).

(config-router)#neighbor 100.100.100.100 update-source 200.200.200.200	Specify the routing update source.
(config-router)#neighbor 220.220.220.220 remote-as 200	Specify the neighbor's IP address (220.220.220.220) and the ASN value of the neighbor (200).
(config-router)#neighbor 220.220.220.220 update-source 150.150.150.150	Specify the routing update source.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#router ospf 1	Configure the OSPF process (1).
(config-router)#network 172.6.7.0/24 area 0	Advertise the network in Area 0.
(config-router)#network 172.1.2.0/24 area 0	Advertise the network in Area 0.
(config-router)#redistribute connected	Redistribute the connected routes.
#configure terminal	Enter Configure mode.
(config)#interface lo	Specify the loopback interface, and enter Interface mode.
(config-if)#ip address 200.200.200.200/32	Configure the IP address on this interface.
(config-if)#exit	Exit Interface mode, and return to Configure mode.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#bgp nexthop-trigger enable	Enable nexthop tracking.
(config)#bgp nexthop-trigger delay 20	Configure the nexthop trigger-delay time interval.
R4	
#configure terminal	Enter Configure mode.
(config)#router ospf 1	Configure the OSPF process (1).
(config-router)#network 172.1.2.0/24 area 0	Advertise the network in Area 0.
(config-router)#network 172.3.4.0/24 area 0	Advertise the network in Area 0.
R5	
#configure terminal	Enter Configure mode.
(config)#interface lo	Specify the loopback interface, and enter Interface mode.
(config-if)#ip address 220.220.220.220/32	Configure the IP address on this interface.
(config-if)#exit	Exit Interface mode, and return to Configure mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)#neighbor 150.150.150.150 remote-as 200	Specify the neighbor's IP address (150.150.150.150) and the ASN value of the neighbor (200).
(config-router)#neighbor 150.150.150.150 update-source lo	Specify the routing update source.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#router ospf 1	Configure the OSPF process (1).
(config-router)#network 172.3.4.0/24 area 0	Advertise the network in Area 0.
(config-router)#redistribute connected	Redistribute the connected routes.

BGP Graceful Restart

During a BGP restart, all BGP peers detect that a session had gone down and come back up. SWMRE invalidates the associated portion of the IP forwarding cache, does a BGP route re-computation, and generates BGP routing updates. The forwarding tables become corrupted and unstable.

Graceful restart helps minimize these negative effects on routing caused by a BGP restart by allowing the restarting BGP router to temporarily retain routing information and continue forwarding packets while BGP restarts. In this way, even while a router rebuilds routing and forwarding tables, the router continues to operate across the TCP connection.

Graceful restart allows a restarting router, and its neighbors, to continue forwarding packets, without disrupting network performance. Because neighboring routers assist in the restart, the restarting router can quickly resume full operation.

The graceful restart capability extends to the case when a configuration change forces a peer reset.

Graceful reset is a refinement of graceful restart to help ensure smooth restarts when a configuration change forces BGP peer reset.

In addition, graceful restart is available for BGP with MPLS, when BGP is used to distribute MPLS-VPN labels. Without the graceful restart capability, when BGP distributes MPLS-VPN labels, a BGP route withdrawal accompanies the associated label withdrawal. This causes a routing flap and a BGP route re-computation, generating BGP routing updates, and unnecessary disruption in the forwarding tables. Also, when BGP goes down, label-switched routers (LSRs) clear FEC label bindings (for VPN routes) learned from the restarting LSR. As a result, MPLS forwarding is impacted across the restart.

The graceful restart and graceful reset capabilities provide a way to save MPLS forwarding states in NSM. These capabilities also synchronize with the VRF table when BGP goes down in the control plane. This feature is supported for the VPNv4 address family.

BGP Distance

Administrative distance in BGP can be configured for a specific address family.

Topology

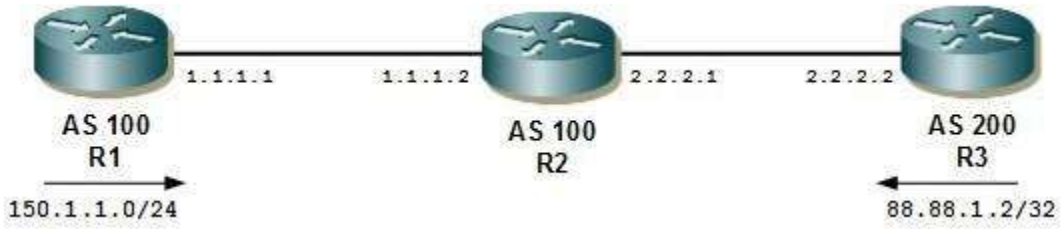

Figure 1-1: Administrative Distance for IPv4 BGP

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 150.1.1.1/24`	Specify IP address for the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#network 150.1.1.0/24`	Specify the network to be advertised by the BGP routing process.
`(config-router)#neighbor 1.1.1.2 remote-as 100`	Specify the neighbor's IP address and ASN value.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#neighbor 2.2.2.2 remote-as 200`	Specify the neighbor's IP address and ASN value.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Specify the neighbor's IP address and the ASN value of another neighbor.
`(config-router)#distance bgp 12 13 120`	Configure the administrative distance for external, internal, and local routes received.
`(config-router)#aggregate-address 150.1.0.0/16 summary-only`	Configure a non-AS-set aggregate route on R2. The local distance is applied to this route.

R3

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 88.88.1.2/32`	Specify IP address for the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.
`(config-router)#network 88.88.1.2/32`	Specify the network to be advertised by the BGP routing process.

`(config-router)#neighbor 2.2.2.1 remote-as 100`	Specify the neighbor's IP address and ASN value.

BGP Weight per Peer

A different weight can be assigned per address family of a peer. For example, a system can be configured to prefer VPN4 routes from peer A and IPv4 routes from peer B.

If the neighbor weight command is given under a specific address-family mode, the peer weight is set for that specific address family. If the address family is not specifically set, the weight is updated for the default address-family.

Topology

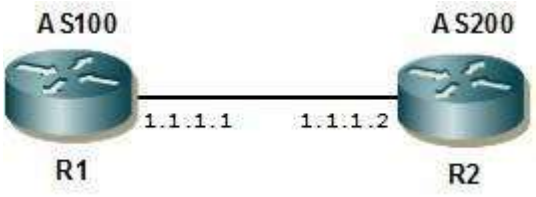

Figure 1-2: BGP Weight Per Peer

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#neighbor 1.1.1.2 remote-as 200`	Specify the neighbor's IP address and ASN value.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Specify the neighbor's IP address and ASN value.
`(config-router)#neighbor 1.1.1.1 weight 500`	Add a weight of `500` to all the routes coming from the neighbor, `1.1.1.1` (only IPv4 routes).

OSPF as PE-CE Protocol for VPNs

In an MPLS VPN environment, customer networks are connected to an MPLS VPN-enabled provider backbone. As shown in Figure 1-3, Customer A areas, Areas 0 and 1, are connected to an MPLS VPN–enabled provider network. Area 0 and Area 1 have routers CE1 and CE2 running OSPF. MP-iBGP is used between PE1 and PE2 to propagate routes between Site 1 (Area 0) and Site 2 (Area 1). Traditional OSPF-BGP redistribution is performed at PE routers, PE1 and PE2. In this case, routes distributed by CE1 into the MP-iBGP cloud are sent to CE2 as external routes, even though both CE1 and CE2 belong to the same customer.

This behavior can be changed with the additional domain ID configuration. Each VRF should be configured a domain ID on the PE routers. If a PE router gets a route through the MP-iBGP cloud and has to send to any customer site, it checks the domain ID value against the list of stored domain ID values. If the incoming domain ID matches any of the stored IDs, that route is inserted into the customer site with the same type, as it was inserted into the MP-BGP cloud; otherwise, it is inserted as external route.

Topology

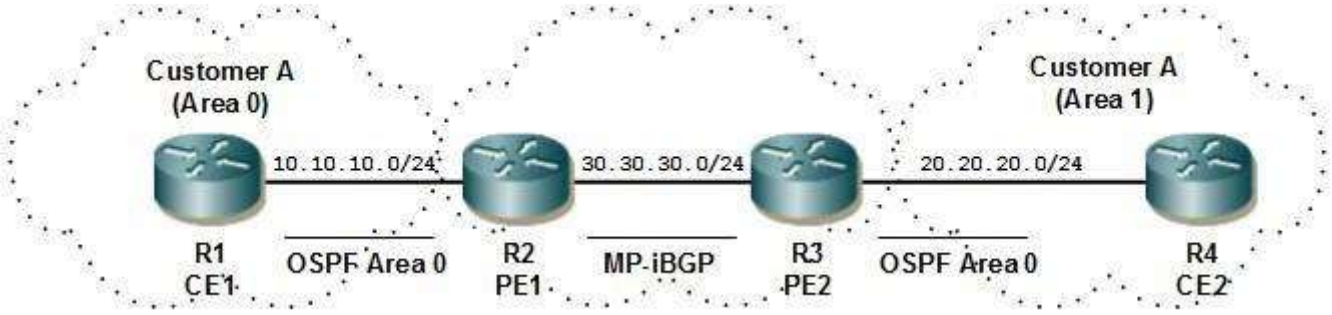

Figure 1-3: OSPF as PE-CE Protocol

CE1

`#configure terminal`	Enter Configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 60.1.1.1/24`	Specify IP address for the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router ospf 1`	Configure the routing process and specify the Process ID (`1`).
`(config-router)#network 10.10.10.0/24 area 0`	Advertise the network in OSPF.
`(config-router)#network 60.1.1.0/24 area 0`	Advertise the loopback IP address in area 0 of router OSPF 1.

PE1

`#configure terminal`	Enter Configure mode.
`(config)#ip vrf ABC`	Specify the name of the VRF (`ABC`) to be created.
`(config-vrf)#rd 10:100`	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.

(config-vrf)#route-target both 10:100	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure.
(config-if)#ip vrf forwarding ABC	Associate interface eth1 to vrf ABC.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router ospf 1 ABC	Configure OSPF for VRF.
(config-router)#network 10.10.10.0/24 area 0	Advertise the network for OSPF adjacency with CE1.
(config-router)#domain-id 1.1.1.1	Configure the primary domain ID.
(config-router)#domain-id 2.2.2.2 secondary	Configure a secondary domain ID.
(config-router)#domain-id 3.3.3.3 secondary	Configure a secondary domain ID.
(config-router)#exit	Exit Router mode and return to Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#neighbor 30.30.30.2 remote-as 100	Configure neighbor 30.30.30.2 for iBGP.
(config-router)#address-family vpnv4 unicast	Enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 30.30.30.2 activate	Activate neighbor 30.30.30.2.
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf ABC	Enter Address-Family-VRF mode.
(config-router)#redistribute ospf	Specify redistributing routes from OSPF into BGP.
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
PE2	
#configure terminal	Enter Configure mode.
(config)#ip vrf ABC	Specify the name of the VRF (ABC) to be created.
(config-vrf)#rd 10:100	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
(config-vrf)#route-target both 10:100	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure.
(config-if)#ip vrf forwarding ABC	Associate interface eth1 to vrf ABC.
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router ospf 1 ABC	Configure OSPF for VRF.
(config-router)#network 20.20.20.0/24 area 0	Advertise the network for OSPF adjacency with CE1.
(config-router)#domain-id 1.1.1.1	Configure the primary domain ID.
(config-router)#domain-id 2.2.2.2 secondary	Configure a secondary domain ID.
(config-router)#domain-id 3.3.3.3 secondary	Configure a secondary domain ID.

(config-router)#exit	Exit Router mode and return to Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#neighbor 30.30.30.1 remote-as 100	Configure neighbor 30.30.30.1 for iBGP.
(config-router)#address-family vpnv4 unicast	Enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 30.30.30.1 activate	Activate neighbor 30.30.30.1.
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf ABC	Enter Address-Family-VRF mode.
(config-router)#redistribute ospf	Specify redistributing routes from OSPF into BGP.
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
CE2	
#configure terminal	Enter Configure mode.
(config)#router ospf 1	Configure the routing process, and specify the Process ID (1).
(config-router)#network 20.20.20.0/24 area 0	Advertise the network in OSPF.

BGP Multipath for IPv4

BGP supports multipath for IPv4 prefixes. BGP Multipath allows load-balancing traffic among multiple BGP routes. It supports both iBGP and eBGP routes. In case of eBGP, the routes should arrive from same AS number.

Topology

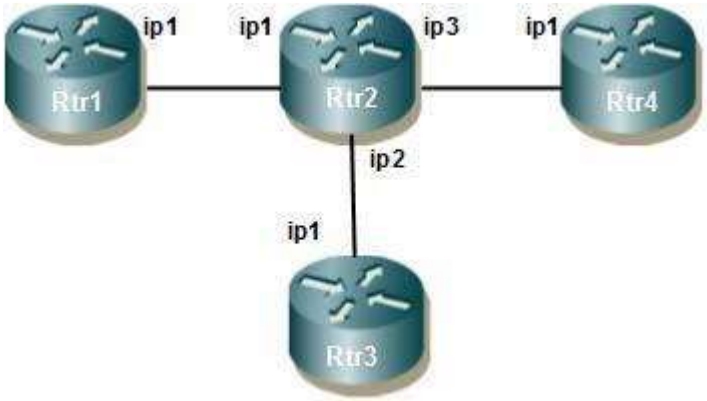

Figure 1-4: Multipath iBGP for IPv4

Rtr1

`#configure terminal`	Enter the Configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the BGP router.
`(config-router)#bgp router-id 2.2.2.2`	Configure a fixed Router ID (2.2.2.2).
`(config-router)#redistribute static`	Redistribute the static routes.
`(config-router)#neighbor 30.30.30.9 remoteas 100`	Configure neighbor 30.30.30.9 for iBGP.
`(config-router)#exit`	Exit the BGP Router mode and return to the Configure mode.
`(config)#ip route 88.88.0.0/16 Null`	Configure static route.

Rtr3

`#configure terminal`	Enter the Configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the BGP router.
`(config-router)#bgp router-id 4.4.4.4`	Configure a fixed Router ID (4.4.4.4).
`(config-router)#redistribute static`	Redistribute the static routes.
`(config-router)#neighbor 40.40.40.9 remoteas 100`	Configure neighbor 40.40.40.9 for iBGP.
`(config-router)#exit`	Exit the BGP Router mode and return to the Configure mode.
`(config)#ip route 88.88.0.0/16 Null`	Configure static route.

Rtr4

`#configure terminal`	Enter the Configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the BGP router.
`(config-router)#bgp router-id 6.6.6.6`	Configure a fixed Router ID (6.6.6.6).
`(config-router)#redistribute static`	Redistribute the static routes.
`(config-router)#neighbor 50.50.50.9 remoteas 100`	Configure neighbor 50.50.50.9 for iBGP.
`(config)#exit`	Exit the BGP Router mode and return to the Configure mode.
`(config)#ip route 88.88.0.0/16 Null`	Configure static route.

Rtr2

#configure terminal	Enter the Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#max-paths ibgp 2	Configure iBGP max-paths (2).
(config)#bgp router-id 9.9.9.9	Configure a fixed Router ID (9.9.9.9).
(config-router)#neighbor 30.30.30.2 remoteas 100	Configure neighbor 30.30.30.2 for iBGP.
(config-router)#neighbor 40.40.40.4 remoteas 100	Configure neighbor 40.40.40.4 for iBGP.
(config-router)#neighbor 50.50.50.6 remoteas 100	Configure neighbor 50.50.50.6 for iBGP.
(config-router)#exit	Exit the Router mode and return to Configure mode.

BGP AS-PATH Multipath-relax

BGP will not load balance across multiple paths by default. We can configure it to do so with the `max-paths ebgp <no-of-multipaths>` command. The criterion of this command is that all attributes must match (Weight, Local preference, AS Path, etc). This is acceptable if we are multi-homed to a single AS, but what if we are multi-homed to different AS.

BGP AS PATH multipath relax effectively allows for ECMP to be done across different neighboring ASN's.

Topology

Below topology explains about BGP AS PATH multipath relax functionality.

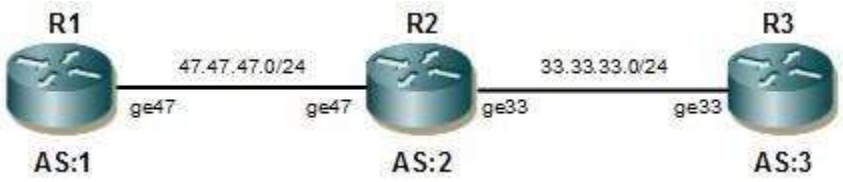

Figure 1-6: BGP AS-PATH Multipath-relax Topology

R1

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter Interface loopback
(config-if)#ip address 100.1.1.1/24	Configure IP address for interface
(config-if)#exit	Exit Interface mode and enter the Configure mode
(config)#interface ge47	Enter Interface loopback
(config-if)#ip address 47.47.47.1/24	Configure IP address for interface
(config-if)#exit	Exit from interface mode and enter the Configure mode
(config)#router bgp 1	Assign the ASN value (1) to the BGP router
(config-router)#neighbor 47.47.47.2 remoteas 2	Configure eBGP neighbor.
(config-router)#network 100.1.1.0/24	Advertise the loopback network into BGP.
(config-router)#end	Exit from BGP router config mode

R2

#configure terminal	Enter the Configure mode.
(config)#interface ge33	Enter Interface mode

BGP Graceful Shutdown

This section contains BGP graceful shutdown configuration examples.

BGP graceful shutdown reduces and avoid packets loss during maintenance shutdown by keeping the path undisturbed even after shutdown by lowering local preference so that routers of an AS can use this until they become aware of new path. If there is no alternate path available in the AS, the same path is used until forwarding failure occurs.

BGP graceful shutdown is supported for both BGP-IPv4 and BGP-IPv6 configurations.

BGP Graceful Shutdown on an Interface

Figure 1-7 shows the minimum configuration required to enable graceful shutdown on an interface. R1, R2, and R3 are three routers in three different ASs. R4 is another router in another AS forming an alternate path – R1 R4 R3 to the primary path.

Note: BGP graceful shutdown is only supported for eBGP configurations. It is not supported for iBGP configurations.

Topology

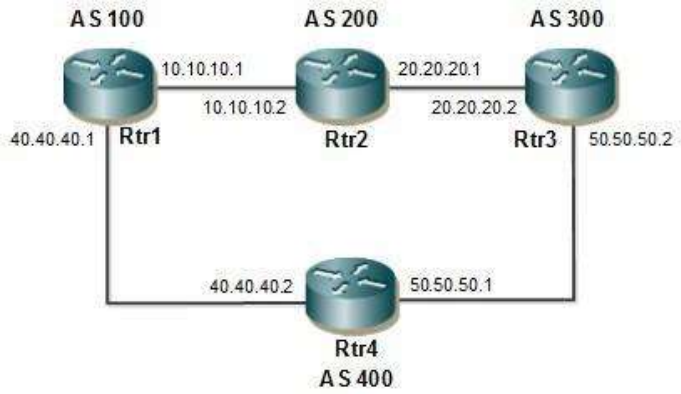

Figure 1-7: BGP Graceful Shutdown Topology 1

Rtr1

`#configure terminal`	Enter the Configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to BGP router. The AS number should be a unique positive integer identifying the Autonomous System.
`(config-router)#neighbor 10.10.10.2 remoteas 200`	Establish eBGP neighborship with R2.
`(config-router)#neighbor 40.40.40.2 remoteas 400`	Establish eBGP neighborship with R4.

Rtr2

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 6.6.6.1/24`	Specify IP address.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 200`	Assign the ASN value (200) to BGP router. The AS number should be a unique positive integer identifying the Autonomous System.
`(config-router)#neighbor 10.10.10.1 remote-as 100`	Establish eBGP neighborship with R1.
`(config-router)#neighbor 20.20.20.2 remote-as 300`	Establish eBGP neighborship with R3.
`(config-router)#bgp g-shut-capable`	Enable the graceful shutdown capability on the DUT.

(config-router)#neighbor 10.10.10.1 g-shut	Enable graceful shutdown functionality on the connected interface to R1.
(config-router)#neighbor 10.10.10.1 g-shut-timer 70	Configure the value of the graceful shutdown timer. After the timer expires, the BGP session initiated for graceful shutdown is shut down. The supported range for the graceful shutdown timer value is from 10 to 65535, in seconds. The default value is 60 seconds.
(config-router)#network 6.6.6.0/24	Specify the network to be advertised by the BGP routing process from DUT.
Rtr3	
#configure terminal	Enter the Configure mode.
(config)#router bgp 300	Assign the ASN value (300) to BGP router. The AS number should be a unique positive integer identifying the Autonomous System.
(config-router)#neighbor 20.20.20.1 remote-as 200	Establish eBGP neighborship with R2
(config-router)#neighbor 50.50.50.1 remote-as 400	Establish eBGP neighborship with R4.
Rtr4	
#configure terminal	Enter the Configure mode.
(config)#router bgp 400	Assign the ASN value (400) to the BGP router. The AS number should be a unique positive integer identifying the Autonomous System.
(config-router)#neighbor 40.40.40.1 remote-as 100	Establish eBGP neighborship with R1.
(config-router)#neighbor 50.50.50.2 remote-as 300	Establish eBGP neighborship with R3.

Validation

```

BGP Graceful Shutdown on a Router

Figure 1-8 shows the minimum configuration required to enable graceful shutdown at the router level. R1, R2, and R3 are three routers in three different ASs. R4 is another router in another AS forming an alternate path – R1 R4 R3 to the primary path.

Note: BGP graceful shutdown at the router level is used to bring down all the BGP sessions on the DUT. If there is still an alternate path for the data traffic, it takes that path.

Topology

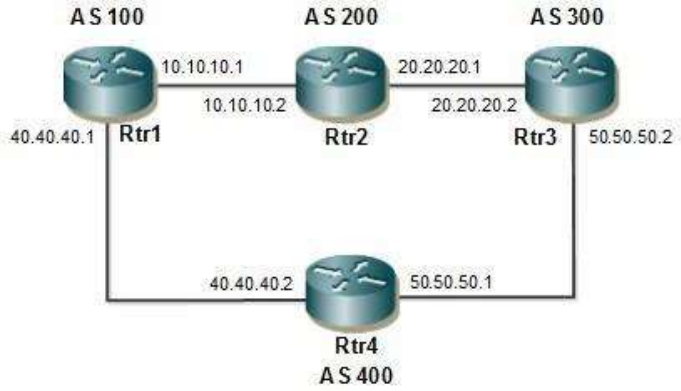

Figure 1-8: BGP Graceful Shutdown Topology 2

Rtr1

`#configure terminal`	Enter the Configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the BGP router. The AS number should be a unique positive integer identifying the Autonomous System.
`(config-router)#neighbor 10.10.10.2 remote-as 200`	Establish eBGP neighborship with R2.
`(config-router)#neighbor 40.40.40.2 remote-as 400`	Establish eBGP neighborship with R4.

Rtr2

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 70.70.70.1/24`	Specify IP address.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 200`	Assign the ASN value (200) to the BGP router. The AS number should be a unique positive integer identifying the Autonomous System.
`(config-router)#neighbor 10.10.10.1 remote-as 100`	Establish eBGP neighborship with R1.
`(config-router)#neighbor 20.20.20.2 remote-as 300`	Establish eBGP neighborship with R3.
`(config-router)#bgp g-shut-capable`	Enabling the graceful shutdown capability on the DUT.
`(config-router)#bgp g-shut`	Enable BGP graceful shutdown functionality at the router level.

(config-router)#bgp g-shut-local-preference 100	Configure the local preference value of the routes to be used during graceful shutdown. This local reference is different from the BGP local preference value and is set in order to make the alternative path a preferred one in the case of graceful shutdown. The supported range of the local preference value is from 0 to 4294967295.
(config-router)#network 70.70.70.0/24	Specify the network to be advertised by the BGP routing process from DUT.

Rtr3

#configure terminal	Enter the Configure mode.
(config)#router bgp 300	Assign the ASN value (300) to the BGP router. The AS number should be a unique positive integer identifying the Autonomous System.
(config-router)#neighbor 20.20.20.1 remote-as 200	Establish eBGP neighborship with R2.
(config-router)#neighbor 50.50.50.1 remote-as 400	Establish eBGP neighborship with R4.

Rtr4

#configure terminal	Enter the Configure mode.
(config)#router bgp 400	Assign the ASN value (400) to the BGP router. The AS number should be a unique positive integer identifying the Autonomous System.
(config-router)#neighbor 40.40.40.1 remote-as 100	Establish eBGP neighborship with R1.
(config-router)#neighbor 50.50.50.2 remote-as 300	Establish eBGP neighborship with R3.

BGP FIB Install (Selective Route Download)

The BGP—Selective Route Download feature allows a network administrator to selectively download some or none of the BGP routes into the Routing Information Base (RIB). The primary application for this feature is to suppress the unnecessary downloading of certain BGP routes to the RIB or Forwarding Information Base (FIB) on a dedicated route reflector, which propagates BGP updates without carrying transit traffic. The feature thereby helps to maximize resources available and to improve routing scalability and convergence on the dedicated route reflector.

With RFC 4456, the concept of route reflection was defined; this would allow configuring designated one or more BGP routers in iBGP network as route reflectors. BGP relaxes the re-advertising restriction on these route reflectors, allowing them to accept and propagate IBGP routes to their clients.

The role of a dedicated route reflector (RR) is to propagate BGP updates without participating in the actual forwarding of transit traffic. That means the RR does not need to have all BGP routes downloaded into its RIB or FIB. It is beneficial for the RR to preserve its resources by not processing and storing those routes.

By default, BGP routes are downloaded to the RIB. To save resources on a dedicated route reflector, such downloading can be reduced or prevented by configuring a table map. A table map is so named because it controls what is put into the BGP routing table.

By reducing the route installation in the dedicated route reflectors, we can maximize availability of resources and improve routing scalability and convergence.

A new command 'table map' is being introduced to achieve this. A table map controls what is put into the BGP routing table. When configured it would reduce or prevent downloading routes to RIB.

Table map command references 'route map' rules available in BGP to control the routes going into the BGP routing table.

Table-map command can be used in two ways:

- When a simple table-map command is given (without filter option), the route map referenced in the table-map command shall be used to set certain properties (such as the traffic index) of the routes for installation into the RIB. The route is always downloaded, regardless of whether it is permitted or denied by the route map.
- When the option 'filter' is given in the table map command, the route map referenced is used to control whether a BGP route is to be downloaded to the IP RIB (hence the filter). A BGP route is not downloaded to the RIB if it is denied by the route map.

Topology

Below topology explains about BGP FIB Install functionality

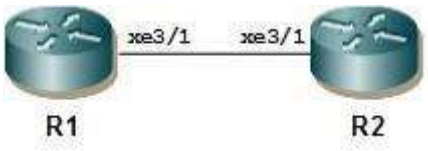

Figure 1-9: BFP FIB Install Topology

R1

`#configure terminal`	Enter the Configure mode.
`(config)#interface xe3/1`	Enter Interface mode.
`(config-if)#ip address 20.1.1.1/24`	Configure IP address for interface
`(config-if)#exit`	Exit Interface mode and enter Configure mode
`(config)# router bgp 100`	Assign the ASN value (100) to the BGP router.
`(config-router)#neighbor 20.1.1.2 remote-as 100`	Configure neighbor in IBGP
`(config-router)#redistribute static`	Redistribute static routes to advertise to its neighbor
`(config-router)#exit`	Exit Router mode and enter Configure mode
`(config)#ip route 1.1.1.0/24 xe3/1`	Configure static route.
`(config)#ip route 2.2.2.0/24 xe3/1`	Configure static route.

(config)#ip route 3.3.3.0/24 xe3/1	Configure static route.
(config)#ip route 4.4.4.0/24 xe3/1	Configure static route.
(config)#ip route 5.5.5.0/24 xe3/1	Configure static route.
(config)#ip route 6.6.6.0/24 xe3/1	Configure static route.

R2

#configure terminal	Enter the Configure mode.
(config)#interface xe3/1	Configure IP address for interface
(config-if)#ip address 20.1.1.2/24	Configure IP address for interface
(config-if)#exit	Exit from interface mode and enter into Configure mode
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#redistribute static	Redistribute the static routes.
(config-router)#neighbor 20.1.1.1 remote-as 100	Configure neighbor iBGP.
(config-router)#exit	Exit the BGP Router mode and return to the Configure mode.
(config)#access-list 1 permit 2.2.2.0 0.0.0.255	Configure access-list by allowing only one route to install in FIB table.
(config)# route-map test permit 1	Configure route-map to match access-list
(config-route-map)# match ip address 1	Match the above configured access-list 1
(config-route-map)#exit	Exit from route-map Configure mode and enter into Configure mode
(config)#router bgp 100	Enter into BGP router mode
(config-router)# table-map test filter	Apply table-map with route-map created and with filter option
(config-router)#end	Exit from router and Configure mode

Validation

Table-map with filter option

Verify BGP neighborship is up between R1 and R2. Before applying table-map in R2, all routes will be installed in FIB table, as in below output.

Gateway of last resort is not set

Table-map without filter option

Remove filter option while applying table-map as below in R2

#configure terminal	Enter the Configure mode.
(config)#router bgp 100	Enter into BGP router mode
(config-router)# table-map test	Apply table-map with route-map created and with filter option
(config-router)#end	Exit from router and Configure mode

```
Do “clear ip bgp table-map” and verify routes in FIB table
Now all routes will be installed in FIB table #show ip
route

```

Gateway of last resort is not set

Note: Same can be tried with IPV6 VRF –v4 and VRF-v6 address-families and this feature is not supported for VPNV4 address-family

Route Target Constraint

BGP/MPLS IP VPNs use PE routers to Route Target (RT) extended communities and control the distribution of routes into the VRFs. Within a given iBGP mesh, PE routers hold routes marked with RouteTargets pertaining to VRFs that have local CE attachments.

BGP RT Constrained Route Distribution is a feature that can be used by service providers in Multiprotocol Label Switching (MPLS) Layer 3 VPNs to reduce the number of unnecessary routing updates that route reflectors (RRs) send to Provider Edge (PE) routers. The reduction in “routing updates” saves resources by allowing RRs, Autonomous System Boundary Routers (ASBRs), and PEs to carry fewer routes. Route targets are used to constrain routing updates.

With (MPLS)VPNs, the (iBGP) peers or Route Reflectors send all VPN4 and/or VPN6 prefixes to the PE routers. The PE routers drop the VPN4/6 prefixes for which there is no importing VPN route forwarding (VRF).

Topology

The topology below shows Route-target filtering in an L3VPN—with Route Target Constraint (RTC), the RR sends only wanted VPN4/6 prefixes to the PE; wanted” means that the PEs have the VRFs importing the specific prefixes.

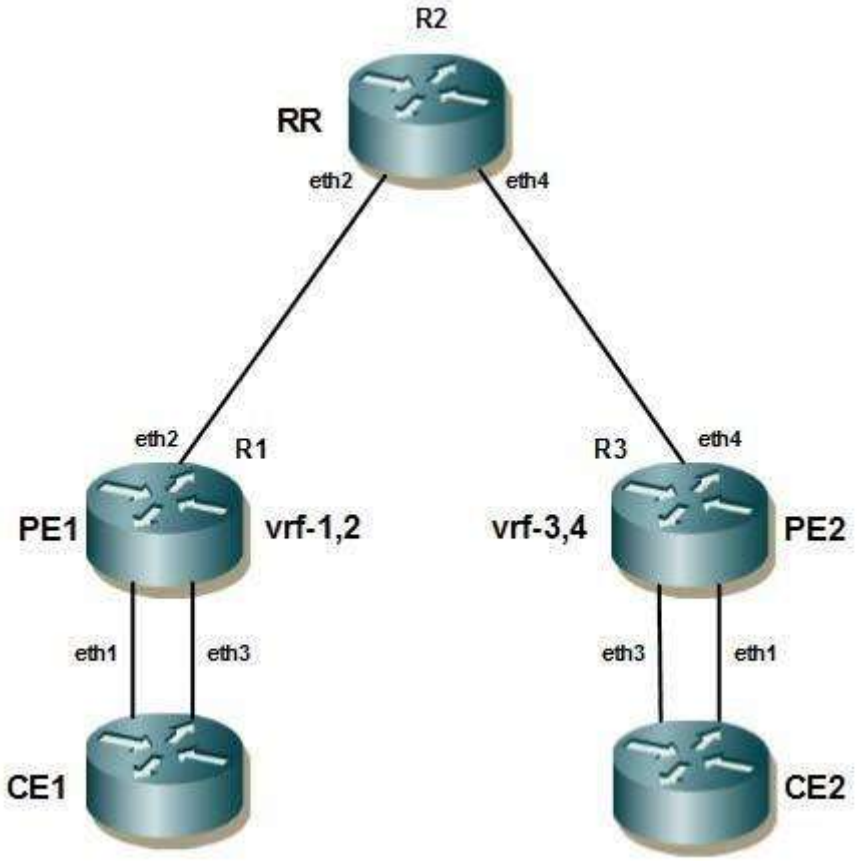

Figure 1-10: Route-target Filter Topology

CE1

`#configure terminal`	Enter Configure mode.

(config-if)#ip address 100.1.1.2/24	Configure IP address for VRF binded interface
(config-if)#exit	Exit interface mode and enter configure mode
(config)#interface eth4	Enter interface mode
(config-if)#ip address 50.1.1.2/24	Configure an IP address for interface
(config-if)#label-switching	Enable label-switching on interface
(config-if)# enable-ldp ipv4	Enable LDP on connected interface between PE2 and RR
(config-if)#exit	Exit interface mode and enter configure mode
(config)#router ospf	Enable OSPF process between PE2 and RR
(config-router)#network 33.33.33.33/32 area 0.0.0.0	Advertise loopback network in OSPF area 0
(config-router)#network 50.1.1.0/24 area 0	Advertise PE2 to RR connected network in OSPF
(config-router)#exit	Exit router OSPF mode
(config)# router bgp 100	Assign the ASN value (100) to the BGP router
(config-router)#neighbor 44.44.44.44 remoteas 100	Configure neighbor (RR) in IBGP
(config-router)#neighbor 44.44.44.44 updatesource 33.33.33.33	Enable neighbor with loopback interface.
(config-router)#address-family vpnv4 unicast	Enter Address-Family-VPNv4 mode.

(config-router-af)#neighbor 44.44.44.44 activate	Activate RR neighbor
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family rtfilter unicast	Enable RT filter address-family mode
(config-router-af)#neighbor 44.44.44.44 activate	Activate neighbor
(config-router-af)#exit-address-family	Exit RTfilter Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf 3	Enter Address-Family-VRF mode.
(config-router-af)#neighbor 101.1.1.1 remoteas 200	Configure CE neighbor in VRF mode
(config-router-af)#neighbor 101.1.1.1 activate	Activate neighbor in VRF
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf 4	Enter Address-Family-VRF mode.
(config-router-af)#neighbor 100.1.1.1 remoteas 200	Configure CE neighbor in VRF mode
(config-router-af)#neighbor 100.1.1.1 activate	Activate neighbor in VRF
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#end	Exit router and configure mode

Validation

Through RTfilter address-family RT values will be exchanged between RR and PE's. Neighbors are activated under this address-family and configured clients as well in this. RR will learn routes from PE's and send to other PE's if it has any peer requesting for that particular routes based on their RT import values

Below outputs shows the routes sent and learned in PE's and installed in VRF's and display's RT filter values exchanged between them.

CHAPTER 2 BGP4+

This chapter contains basic BGP4+ configuration examples.

For details about the commands used in these examples, see the *Border Gateway Protocol Command Reference*.

Enable iBGP Peering Using a Global Address

This example shows the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same Autonomous System (AS), AS200, connecting to network 3ffe:10::/48. First, specify the IPv6 global address, then define the routing process and AS number to which the routers belong. Configure a fixed Router ID, then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 2-11: iBGP Peering

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface `(eth1)` to configure.
`(config-if)#ipv6 address 3ffe:10::10/48`	Specify the IPv6 global address.
`(config-if)#exit`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of `R1`.
`(config-router)#bgp router-id 10.10.10.10`	Configure a fixed Router ID (`10.10.10.10`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10::11 remoteas 200`	Define BGP neighbor `R2`, and establish a TCP session by specifying the global IPv6 address (`3ffe:10::11`) and the AS number `(200)` of neighbor R2.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::11 activate`	Activate the neighbor `R2(3ffe:10::11)`, and enable exchange of IPv6 address prefix types with this neighbor.

R2

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface `(eth1)` to configure.
`(config-if)#ipv6 address 3ffe:10::11/48`	Specify the IPv6 global address.
`(config-if)#exit`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of `R2`.
`(config-router)#bgp router-id 10.10.10.11`	Configure a fixed Router ID (`10.10.10.11`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10::10 remoteas 200`	Define the BGP neighbor (R1), and establish a TCP session by specifying the global IPv6 address (`3ffe:10::10`) and the AS number `(200)` of neighbor `R1`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::10 activate`	Activate the neighbor `R1(3ffe:10::10)`, and enable exchange of IPv6 address prefix types with this neighbor.

Validation

show bgp ipv6 summary, show bgp ipv6 neighbors

Enable iBGP Peering Using Link-local Address

This example shows the minimum configuration required to enable iBGP on an interface. R1 and R2 are two routers belonging to the same AS, AS200, connecting to network fe80::/10. First, define the routing process and AS number to which the routers belong. Configure a fixed Router ID for the BGP4+ routing process, then, define BGP neighbors to start exchanging routing updates.

Topology

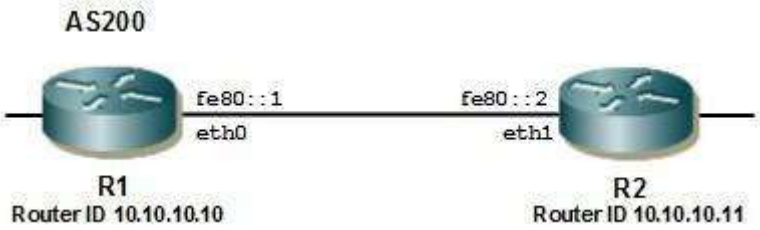

Figure 2-12: iBGP Peering Link-Local Address

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of `R1`.

(config-router)#bgp router-id 10.10.10.10	Configure a fixed Router ID (10.10.10.10) for the BGP4+ routing process.
(config-router)#neighbor fe80::2 remote-as 200	Define BGP neighbor (R2), and establish a TCP session by specifying the link-local address (fe80::2) and the AS number (200) of neighbor R2.
(config-router)#neighbor fe80::2 interface eth0	To specify a link-local neighbor, configure the interface name of the neighbor fe80::2.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor fe80::2 activate	Activate the neighbor R2(fe80::2), and enable exchange of IPv6 address prefix types with this neighbor.
R2	
(config)#router bgp 200	Define the routing process. The number 200 specifies the AS number of R2.
(config-router)#bgp router-id 10.10.10.11	Configure a fixed Router ID (10.10.10.11) for the BGP4+ routing process.
(config-router)#neighbor fe80::1 remote-as 200	Define the BGP neighbor (R1), and establish a TCP session by specifying the link-local address R1(fe80::1) and the AS number (200) of neighbor R1.
(config-router)#neighbor fe80::1 interface eth1	To specify a link-local neighbor, configure the interface name of the neighbor fe80::1.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor fe80::1 activate	Activate the neighbor R1(fe80:1), and enable exchange of IPv6 address prefix types with this neighbor.

Validation

show bgp ipv6 summary, show bgp ipv6, show bgp ipv6 neighbors

Enable eBGP Peering Between Different Autonomous Systems

This example shows the minimum configuration required to enable eBGP on an interface, when the routers belong to different ASs. R1 and R2 are two routers in different ASs, AS200 and AS300 connecting to network 3ffe:10::/64.

Topology

Figure 2-13: BGP Peering - Different AS

Configuration

R1

#configure terminal	Enter Configure mode.
(config)#router bgp 200	Define the routing process. The number 200 specifies the AS number of R1.
(config-router)#bgp router-id 10.10.10.10	Configure a fixed Router ID (10.10.10.10) for the BGP4+ routing process.
(config-router)#neighbor 3ffe:10::11 remoteas 300	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (3ffe:10::11) and the AS number (300) of neighbor R2.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor 3ffe:10::11 activate	Activate the neighbor R2(3ffe:10::11), and enable exchange of IPv6 address prefix types with this neighbor.

R2

(config)#router bgp 300	Define the routing process. The number 300 specifies the AS number of R2.
(config-router)#bgp router-id 10.10.10.11	Configure a fixed Router ID (10.10.10.11) for the BGP4+ routing process.
(config-router)#neighbor 3ffe:10::10 remote-as 200	Define the BGP neighbor (R1), and establish a TCP session by specifying the IPv6 address (3ffe:10::10) and the AS number (200) of neighbor R1.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor 3ffe:10::10 activate	Activate the neighbor R1(3ffe:10::10) and enable exchange of IPv6 address prefix types with this neighbor.

Validation

show bgp ipv6 summary, show bgp ipv6 neighbors

Route-Map

Use route-maps to filter incoming updates from a BGP peer. In this example, a prefix list named myPrefixList on R1 is configured to deny entry of any routes with the IP address 3ffe:12::/32. To test the filter, R2 is configured to generate network prefixes 3ffe:11::/48 and 3ffe:12::/48. To verify, use the show bgp ipv6 command on R1; it displays R1 receiving only the 3ffe:11::/48 network prefix.

Topology

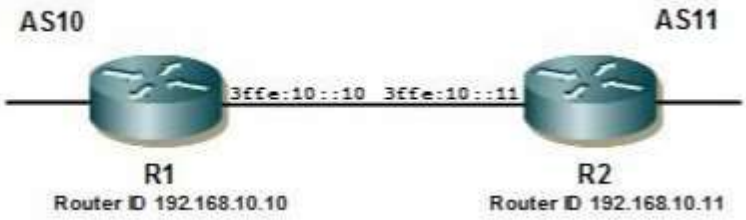

Figure 2-14: Route-Map

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#ipv6 prefix-list myPrefixList seq 5 deny 3ffe:12::/32 ge 48 le 64`	Create an entry in the prefix-list. `myPrefixList` is the name of the map that is created. `5` and `10` specify the sequence number or position of this specific route map. `deny` specifies the packets are to be rejected. `permit` specifies the packets are to be allowed. `48` and `64` are the minimum and maximum prefix lengths, respectively, to be matched.
`(config)#ipv6 prefix-list myPrefixList seq 10 permit any`	Create another entry in the `myPrefixList` map. `10` specifies the sequence number or position of this specific route map. `permit any` specifies accept all packets of any length.
`(config)#route-map myPrefixList permit 1`	Enter Route-map mode.
`(config-route-map)#match ipv6 address prefix-list myPrefixList`	Set the match criteria. In this case, if the route-map name matches `myPrefixList`, the packets from the first sequence will be denied.
`(config-route-map)#exit`	Exit Route-map mode, and return to Configure mode.
`(config)#router bgp 10`	Define the routing process. The number `10` specifies the AS number of `R1`.
`(config-router)#bgp router-id 192.168.10.10`	Configure a fixed Router ID (`192.168.10.10`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10:11 remoteas 11`	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (`3ffe:10::11`) and the AS number (`11`) of neighbor `R2`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`#configure terminal`	Enter Configure mode.
`(config)#ipv6 prefix-list myPrefixList seq 5 deny 3ffe:12::/32 ge 48 le 64`	Create an entry in the prefix-list. `myPrefixList` is the name of the map that is created. `5` and `10` specify the sequence number or position of this specific route map. `deny` specifies the packets are to be rejected. `permit` specifies the packets are to be allowed. `48` and `64` are the minimum and maximum prefix lengths, respectively, to be matched.

(config)#ipv6 prefix-list myPrefixList seq 10 permit any	Create another entry in the myPrefixList map. 10 specifies the sequence number or position of this specific route map. permit any specifies accept all packets of any length.
(config)#route-map myPrefixList permit 1	Enter Route-map mode.
(config-route-map)#match ipv6 address prefix-list myPrefixList	Set the match criteria. In this case, if the route-map name matches myPrefixList, the packets from the first sequence will be denied.
(config-route-map)#exit	Exit Route-map mode, and return to Configure mode.
(config-router-af)#neighbor 3ffe:10::11 activate	Activate the neighbor R2(3ffe:10::11), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:10::11 route-map myPrefixList in	Apply the route-map myPrefixList to all incoming routes.
(config-router-af)#exit-address-family	Exit Address Family mode, and return to Router mode.
(config-router)#exit	Exit Router mode, and return to Configure mode.
R2	
(config)#router bgp 11	Define the routing process. The number 11 specifies the AS number of R2.
(config-router)#bgp router-id 192.168.10.11	Configure a fixed Router ID (192.168.10.11) for the BGP4+ routing process.
(config-router)#neighbor 3ffe:10::10 remoteas 10	Define the BGP neighbor (R1), and establish a TCP session by specifying the IPv6 address (3ffe:10::10) and the AS number (10) of neighbor R1.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#network 3ffe:11::/48	Announce the IPv6 network prefix (3ffe:11::/48).
(config-router-af)#network 3ffe:12::/48	Announce the IPv6 network prefix (3ffe:12::/48).
(config-router-af)#neighbor 3ffe:10::10 activate	Activate the neighbor R1(3ffe:10::10), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#exit-address-family	Exit Address Family mode, and return to Router mode.

Validation

show bgp ipv6 summary, show bgp ipv6 neighbors, show bgp ipv6, show bgp ipv6 prefix-list

Route Reflector

Use Route Reflectors to reduce the iBGP mesh inside an AS. In this example, R2, R5, and R4 would have to maintain a full mesh among themselves, but by making R5 the Route Reflector, R2 (Client1) has an iBGP session with RR only, and not with R4 (Client 2). The routes learned from R2 are advertised to the other clients, and to iBGP peers outside the cluster; the iBGP routes learned from iBGP peers outside the cluster are advertised to the R2. This reduces the iBGP peer connections in AS1.

Topology

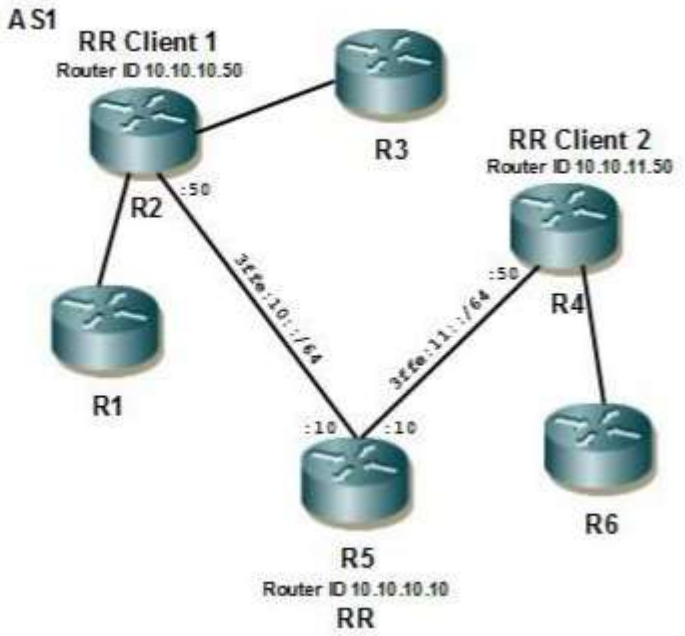

Figure 2-15: BGP4+ Route Reflector

Configuration

RR (R5)

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 1`	Define the routing process. The number `1` specifies the AS number of `R5` (RR).
`(config-router)#bgp router-id 10.10.10.10`	Configure a fixed Router ID (`10.10.10.10`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10::50 remote-as 1`	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (`3ffe:10::50`) and the AS number `(1)` of neighbor R2.
`(config-router)#neighbor 3ffe:11::50 remote-as 1`	Define the BGP neighbor (R4), and establish a TCP session by specifying the IPv6 address (`3ffe:11::50`) and the AS number `(1)` of neighbor R4.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::50 activate`	Activate the neighbor `R2(3ffe:10::50)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:10::50 routereflector-client`	Configure `R5` as the Route-Reflector (RR) and neighbor `R2` as its client.
`(config-router-af)#neighbor 3ffe:11::50 activate`	Activate the neighbor `R4(3ffe:11::50)`, and enable exchange of IPv6 address prefix types with this neighbor.

`(config-router-af)#neighbor 3ffe:11::50 routereflector-client`	Configure `R5` as the Route-Reflector (RR) and neighbor `R4` as its client.

RR Client 1 (R2)

`(config)#router bgp 1`	Define the routing process. The number `1` specifies the AS number of `R2` (RR Client 1).
`(config-router)#bgp router-id 10.10.10.50`	Configure a fixed Router ID (`10.10.10.50`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10::10 remote-as 1`	Define the BGP neighbor (R5), and establish a TCP session by specifying the IPv6 address (`3ffe:10::10`) and the AS number `(1)` of neighbor `R5`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::10 activate`	Activate the neighbor `(3ffe:10::10)`, and enable exchange of IPv6 address prefix types with this neighbor.

RR Client 2 (R4)

`(config)#router bgp 1`	Define the routing process. The number `1` specifies the AS number of `R4` (RR Client 2).
`(config-router)#bgp router-id 10.10.11.50`	Configure a fixed Router ID (`10.10.11.50`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:11::10 remote-as 1`	Define the BGP neighbor (`R5`), and establish a TCP session by specifying the IPv6 address (`3ffe:11::10`) and the AS number `(1)` of the neighbor.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:11::10 activate`	Activate the neighbor `(3ffe:11::10)`, and enable exchange of IPv6 address prefix types with this neighbor.

Validation

show bgp ipv6 summary, show bgp ipv6 neighbors

Confederations

In this example, AS1 contains three Confederated Autonomous Systems--AS 1000, AS 1001 and AS 1002. To any outside AS, the overall Confederation is a single AS, AS1. Confederation eBGP is run between R2 and R5, and between R5 and R7. R2 is configured so that its local AS is 1000. Its peer connection to R5 is set up like any other eBGP session. The `bgp confederation identifier` command informs the router that it is a member of a Confederation and passes the Confederation ID. The `bgp confederation peers` command lists the member AS to which R2 is connected. The same command tells the BGP process that the eBGP connection is a Confederation eBGP, rather than a normal eBGP.

Topology

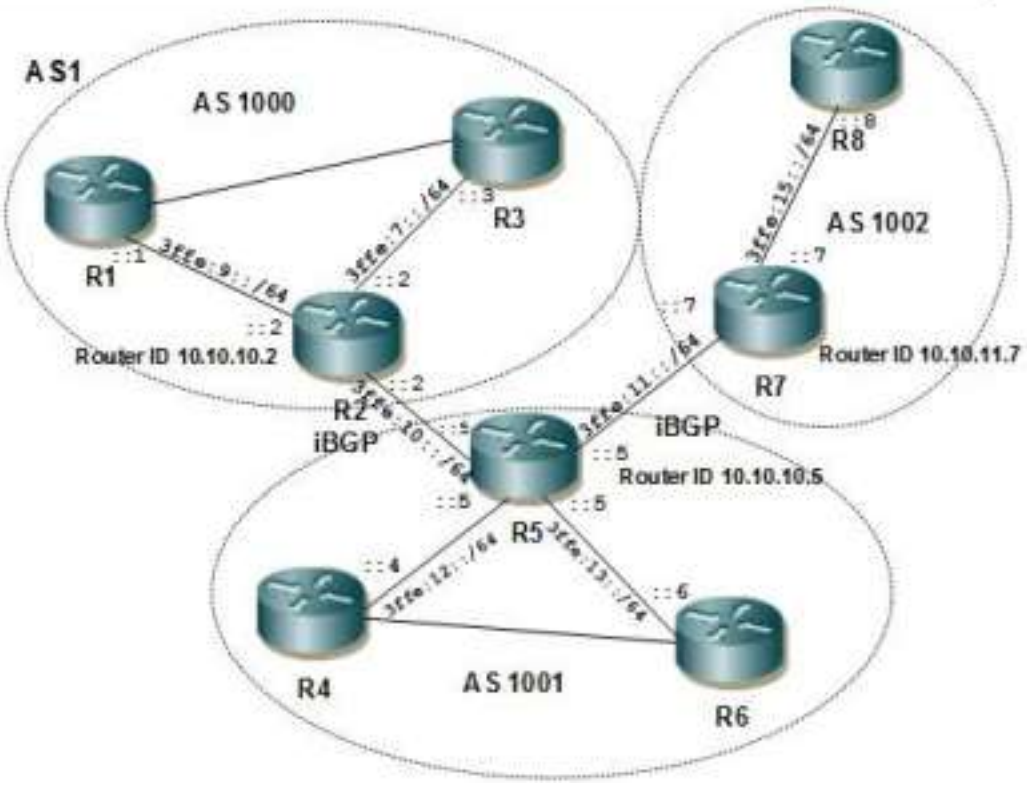

Figure 2-16: BGP4+ Confederations

Configuration

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 1000`	Define the routing process. The number `1000` specifies the AS number of `R2`.
`(config-router)#bgp router-id 10.10.10.2`	Configure a fixed Router ID (`10.10.10.2`) for the BGP4+ routing process.
`(config-router)#bgp confederation identifier 1`	Specify the BGP Confederation Identifier (1). To others, the group will appear as a single AS, and the identifier as its AS number.
`(config-router)#bgp confederation peers 1001 1002`	Specify ASs `1001` and `1002` as confederation peers, making them members of the Confederation.
`(config-router)#neighbor 3ffe:10::5 remoteas 1001`	Define the BGP neighbor (R5), and establish a TCP session by specifying the IPv6 address (`3ffe:10::5`) and the AS number (`1001`) of neighbor `R5`.
`(config-router)#neighbor 3ffe:9::1 remote-as 1000`	Define the BGP neighbor (`R1`), and establish a TCP session by specifying the IPv6 address (`3ffe:9::1`) and the AS number (`1000`) of neighbor `R1`.

(config-router)#neighbor 3ffe:7::3 remote-as 1000	Define the BGP neighbor (R3), and establish a TCP session by specifying the IPv6 address (3ffe:7::3) and the AS number (1000) of neighbor R3.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor 3ffe:10::5 activate	Activate neighbor R5(3ffe:10::5), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:9::1 activate	Activate neighbor R1(3ffe:9::1), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:7::3 activate	Activate neighbor R3(3ffe:7::3), and enable exchange of IPv6 address prefix types with this neighbor.

R5

(config)#router bgp 1001	Define the routing process. The number 1001 specifies the AS number of R5.
(config-router)#bgp router-id 10.10.10.5	Configure a fixed Router ID (10.10.10.5) for the BGP4+ routing process.
(config-router)#bgp confederation identifier 1	Specify the BGP Confederation Identifier (1). To others, the group will appear as a single AS, and the identifier as its AS number.
(config-router)#bgp confederation peers 1000 1002	Specify ASs 1001 and 1002 as confederation peers, making them members of the Confederation.
(config-router)#neighbor 3ffe:10::2 remoteas 1000	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (3ffe:10::2) and the AS number (1000) of neighbor R2.
(config-router)#neighbor 3ffe:11::7 remoteas 1002	Define the BGP neighbor (R7), and establish a TCP session by specifying the IPv6 address (3ffe:11::7) and the AS number (1002) of neighbor R7.
(config-router)#neighbor 3ffe:12::4 remoteas 1001	Define the BGP neighbor (R4), and establish a TCP session by specifying the IPv6 address (3ffe:12::4) and the AS number (1001) of neighbor R4.
(config-router)#neighbor 3ffe:13::6 remoteas 1001	Define the BGP neighbor (R6), and establish a TCP session by specifying the IPv6 address (3ffe:13::6) and the AS number (1001) of neighbor R6.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.

(config-router-af)#neighbor 3ffe:10::2 activate	Activate the neighbor R2(3ffe:10::2), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:11::7 activate	Activate the neighbor R7(3ffe:11::7), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:12::4 activate	Activate the neighbor R4(3ffe:12::4), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:13::6 activate	Activate the neighbor R6(3ffe:13::6), and enable exchange of IPv6 address prefix types with this neighbor.

R7

(config)#router bgp 1002	Define the routing process. The number 1002 specifies the AS number of R7.
(config-router)#bgp router-id 10.10.11.7	Configure a fixed Router ID (10.10.11.7) for the BGP4+ routing process.
(config-router)#bgp confederation identifier 1	Specify BGP Confederation Identifier (1). To others, the group will appear as a single AS, and the identifier as its AS number.
(config-router)#bgp confederation peers 1000 1001	Specify ASs 1000 and 1001 as confederation peers, making them members of the Confederation.
(config-router)#neighbor 3ffe:11::5 remoteas 1001	Define the BGP neighbor (R5), and establish a TCP session by specifying the IPv6 address (3ffe:11::5) and the AS number (1001) of neighbor R5.
(config-router)#neighbor 3ffe:15::8 remoteas 1002	Define the BGP neighbor (R8), and establish a TCP session by specifying the IPv6 address (3ffe:15::8) and the AS number (1002) of neighbor R8.
(config-router)#address-family ipv6	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
(config-router-af)#neighbor 3ffe:11::5 activate	Activate the neighbor R5(3ffe:11::5), and enable exchange of IPv6 address prefix types with this neighbor.
(config-router-af)#neighbor 3ffe:15::8 activate	Activate the neighbor R8(3ffe:15::8), and enable exchange of IPv6 address prefix types with this neighbor.

Validation

show bgp ipv6 summary, show bgp ipv6 neighbors

BGP4+ Graceful Restart

Using BGP+ graceful restart, the data-forwarding plane of a router can continue to process and forward packets, even if the control plane (which is responsible for determining best paths) fails.

Topology

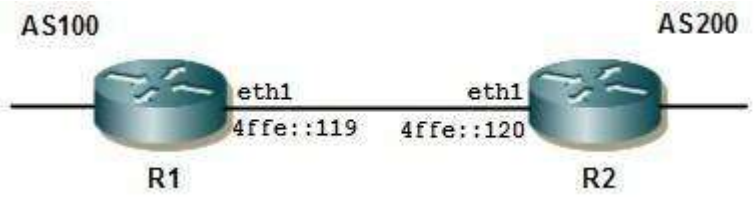

Figure 2-17: BGP4+ Graceful Restart

Configuration

R1

#configure terminal	Enter Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the router.
(config-router)#bgp graceful-restart	Enable BGP graceful restart support.
(config-router)#neighbor 4ffe::120 remote-as 200	Specify the neighbor's IP address (4ffe::120) and the ASN value of the neighbor (200).
(config-router)#address-family ipv6 unicast	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
(config-router-af)#neighbor 4ffe::120 activate	Specify the neighbor's IPv6 address (4ffe::120), and activate the neighbor.
(config-router-af)#neighbor 4ffe::120 capability graceful-restart	Specify the neighbor's IPv6 address (4ffe::120) for which the graceful restart capability is supported.

R2

#configure terminal	Enter Configure mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)#bgp graceful-restart	Enable BGP graceful restart support.
(config-router)#bgp graceful-restart restarttime 120	Configure the maximum time (120) required for neighbor(s) to restart.
(config-router)#bgp graceful-restart stalepath-time 120	Configure the maximum time (120) to retain stale paths from the restarting neighbor(s).
(config-router)#neighbor 4ffe::119 remote-as 100	Specify the neighbor's IP address (4ffe::119) and the ASN value of the neighbor (100).
(config-router)#address-family ipv6 unicast	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
(config-router-af)#neighbor 4ffe::119 activate	Specify the neighbor's IPv6 address (4ffe::119), and activate the neighbor.
(config-router-af)#neighbor 4ffe::119 capability graceful-restart	Specify the neighbor's IPv6 address (4ffe::119) for which the graceful restart capability is supported.

Validation

show bgp ipv6 summary, show ip bgp neighbors, show bgp ipv6, show ipv6 route database bgp, show ipv6 route database, show ipv6 route

Configure BGP4+ Distance

Administrative distance in BGP+ can be configured for a specific address family.

This example shows configuring the BGP administrative distance for the IPv6 address family.

Topology

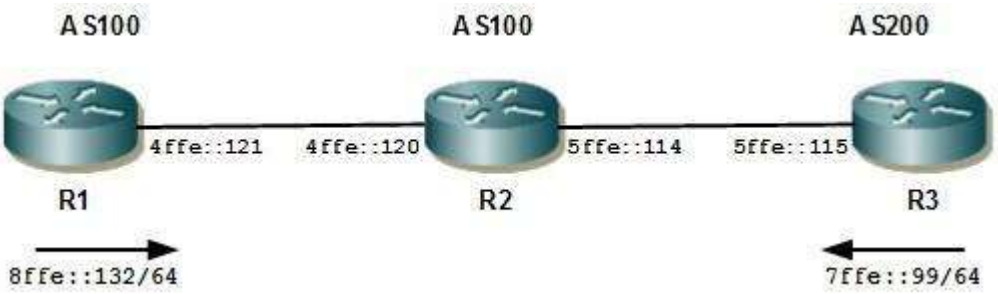

Figure 2-18: BGP4+ Distance

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#network 8ffe::132/64`	Specify the network to be advertised by the BGP routing process.
`(config-router)#neighbor 4ffe::120 remote-as 100`	Specify the neighbor's IP address and ASN value.
`(config-router)#address-family ipv6 unicast`	Enter IPv6 Address-Family mode.
`(config-router-af)#neighbor 4ffe::120 activate`	Activate the IPv6 neighbor.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#neighbor 4ffe::121 remote-as` value. `100`	Specify the neighbor's IP address and ASN
`(config-router)#neighbor 5ffe::115 remote-as 200`	Specify the neighbor's IP address and the ASN value of another neighbor.
`(config-router)#address-family ipv6 unicast`	Enter IPv6 Address-Family mode.
`(config-router-af)#aggregate-address 2ffe::102/64 summary-only`	Configure an IPv6 non-AS-set aggregate route on R2. The local distance will be applied to this route.
`(config-router-af)#neighbor 4ffe::121 activate`	Activate the IPv6 neighbor.

(config-router-af)#neighbor 5ffe::115 activate	Activate the IPv6 neighbor.
(config-router-af)#distance 12 13 11	Configure the administrative distance for external, internal, and local routes received in IPv6 Address-Family mode.

R3

#configure terminal	Enter Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the router.
(config-router)#network 7ffe::99/64	Specify the network to be advertised by the BGP routing process.
(config-router)#neighbor 5ffe::114 remote-as value. 100	Specify the neighbor's IP address and ASN
(config-router)#address-family ipv6 unicast	Enter IPv6 Address-Family mode.
(config-router-af)#neighbor 5ffe::114 activate	Activate the IPv6 neighbor.

Validation

show bgp ipv6 summary, show ip bgp neighbors, show ipv6 route database bgp, show ipv6 route database, show ipv6 route, show bgp ipv6

BGP4+ Graceful Reset

The graceful restart mechanism for BGP+ session reset (the BGP+ daemon is not restarted) is used so that any changes in network configuration do not affect packet forwarding. The `bgp graceful-restart graceful-reset` CLI invokes graceful restart when a configuration change forces a peer reset. Graceful restart is invoked only when these CLI configuration changes force a peer reset.

Topology

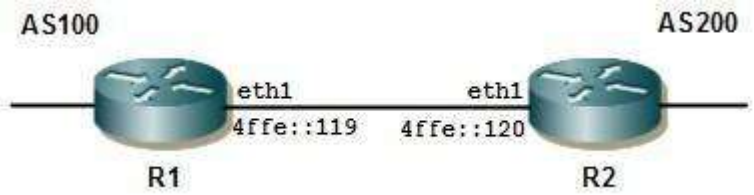

Figure 2-19: BGP4+ Graceful Reset

Configuration

R1

#configure terminal	Enter Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the router.
(config-router)#bgp graceful-restart	Enable BGP graceful restart support.

(config-router)#bgp graceful-restart graceful-reset	Configure to invoke graceful restart when a configuration change forces a peer reset.
(config-router)#neighbor 4ffe::120 remote-as 200	Specify the neighbor's IP address (4ffe::120) and the ASN value of the neighbor (200).
(config-router)#address-family ipv6 unicast	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
(config-router-af)#neighbor 4ffe::120 activate	Specify the neighbor's IPv6 address (4ffe::120), and activate the neighbor.
(config-router-af)#neighbor 4ffe::120 capability graceful-restart	Specify the neighbor's IPv6 address (4ffe::120) for which the graceful restart capability is supported.

R2

#configure terminal	Enter Configure mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)#bgp graceful-restart	Enable BGP graceful restart support.
(config-router)#bgp graceful-restart graceful-reset	Configure to invoke graceful restart when a configuration change forces a peer reset.
(config-router)#neighbor 4ffe::119 remote-as 100	Specify the neighbor's IP address (4ffe::119) and the ASN value of the neighbor (100).
(config-router)#address-family ipv6 unicast	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
(config-router-af)#neighbor 4ffe::119 activate	Specify the neighbor's IPv6 address (4ffe::119), and activate the neighbor.
(config-router-af)#neighbor 4ffe::119 capability graceful-restart	Specify the neighbor's IPv6 address (4ffe::119) for which the graceful restart capability is supported.

Validation

show bgp ipv6 summary, show ip bgp neighbors, show bgp ipv6, show ipv6 route database bgp, show ipv6 route database, show ipv6 route

CHAPTER 3 OSPFv2

This chapter contains basic OSPFv2 (Open Shortest Path First) configuration examples.

For details about the commands used in these examples, see the *Open Shortest Path First Command Reference*.

Enable OSPF on an Interface

The diagram shows the minimum configuration required to enable OSPF on an interface. R1 and R2 are two routers in Area 0 connecting to network 10.10.10.0/24.

Note: Configure one interface so that it belongs to only one area. It is possible, however, to configure different interfaces on a router to belong to different areas.

Topology

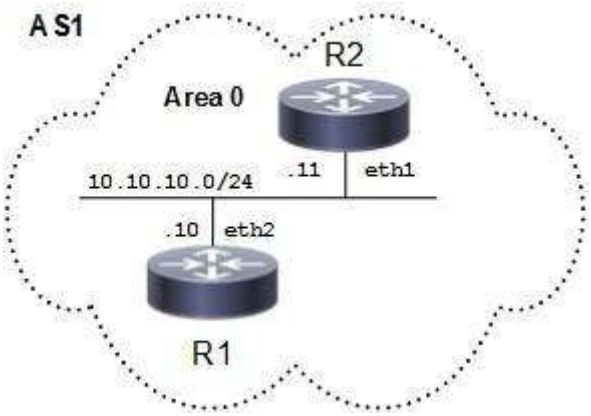

Figure 3-20: Basic OSPF Topology

R1

`#configure terminal`	Enter configure mode
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).

R2

`#configure terminal`	Enter configure mode
`(config)#router ospf 200`	Configure the routing process, and specify the Process ID `(200)`. The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface `(10.10.10.0/24)` on which OSPF runs, and associate the area ID `(0)` with the interface.

```

Set Priority

This example shows how to set the priority for an interface. Set a high priority for a router to make it the Designated Router (DR). Router R3 is configured to have a priority of 10, which is higher than the default priority (1) of R1 and R2; making it the DR.

Topology

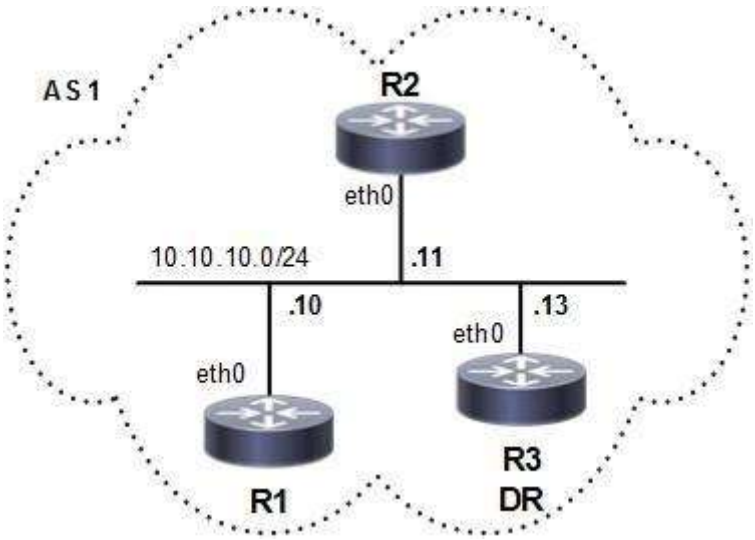

Figure 3-21: Set OSPF Priority

R3

`#configure terminal`	Enter configure mode
`(config)#``interface eth0`	Specify the interface (`eth0`) to configure.
`(config-if)#``ip ospf priority 10`	Specify the router priority to a higher priority (10) to make R3 the Designated Router (DR).
`(config-if)#``exit`	Exit interface mode.
`(config)#``router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#``network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface.

R1

`#configure terminal`	Enter configure mode
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).

R2

`#configure terminal`	Enter configure mode
`(config)#router ospf 200`	Configure the routing process, and specify the Process ID (`200`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface.

Area Border Router

This example shows configuration for an Area Border Router. R2 is an Area Border Router (ABR). On R2, Interface eth0 is in Area 0, and Interface eth1 is in Area 1.

Topology

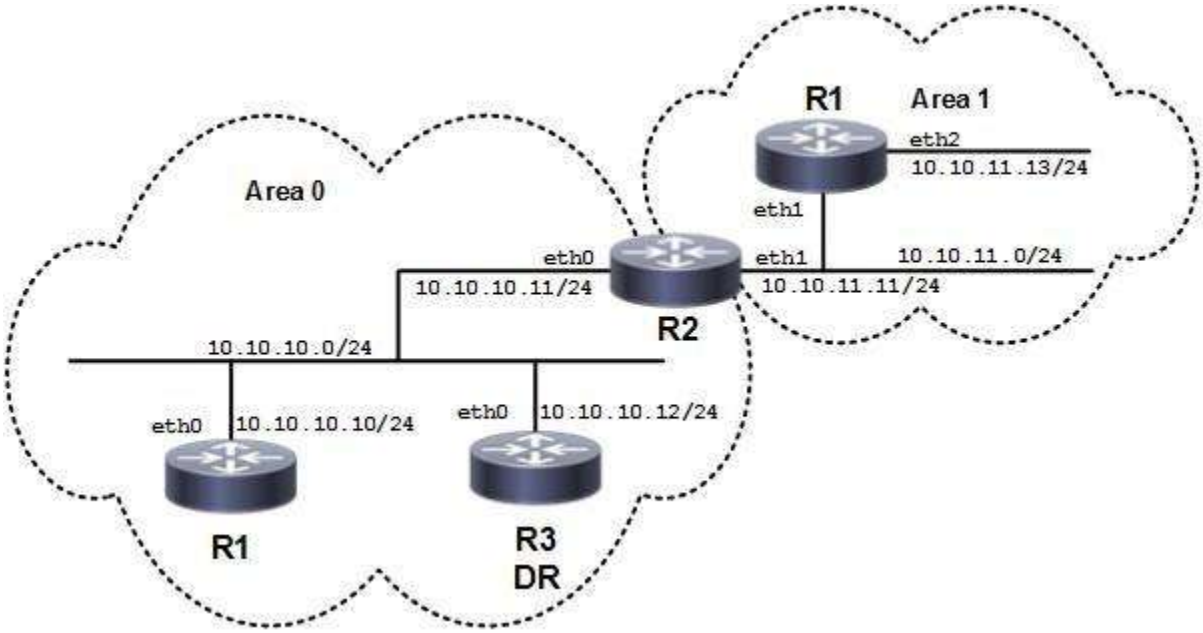

Figure 3-22: OSPF ABR Topology

Configuration

R2

`#configure terminal`	Enter configure mode
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer.
`(config-router)#network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface.
`(config-router)#network 10.10.11.0/24 area 1`	Define the other interface `(10.10.11.0/24)` on which OSPF runs, and associate the area ID `(1)` with the interface.

Redistribute Routes into OSPF

In this example, the configuration causes BGP routes to be imported into the OSPF routing table, and advertised as Type 5 External LSAs into Area 0.

Topology

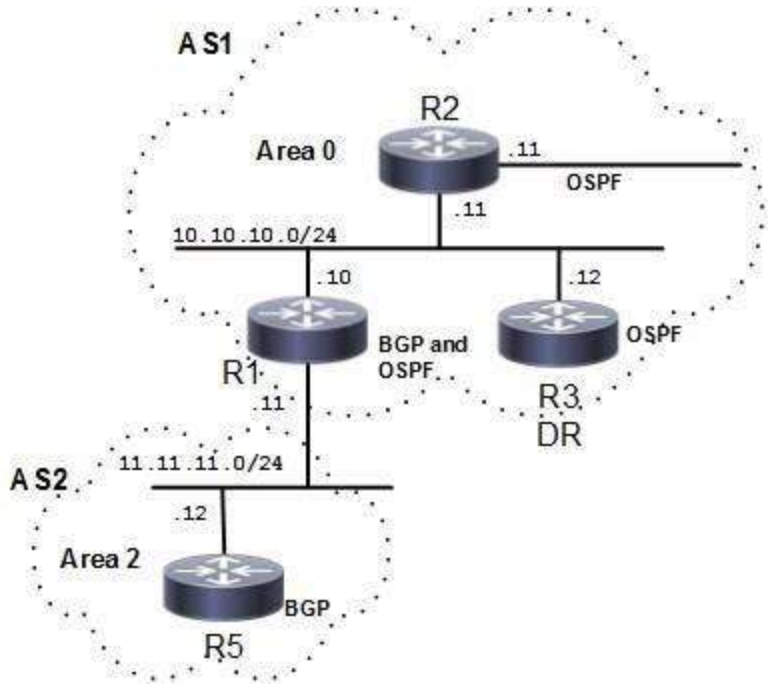

Figure 3-23: Redistribute Routes

R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#redistribute bgp`	Specify redistributing routes from other routing protocol (BGP) into OSPF.

Validation

```
#show ip ospf route

OSPF process 100:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2

C  10.10.9.0/24 [1] is directly connected, eth2, Area 0.0.0.0
C 10.10.10.0/24 [1] is directly connected, eth3, Area 0.0.0.0
O 10.10.11.0/24 [101] via 10.10.10.11, eth3, Area 0.0.0.0
C 10.10.12.0/24 [1] is directly connected, eth1, Area 0.0.0.0
O 10.10.13.0/24 [102] via 10.10.10.11, eth3, Area 0.0.0.0
O  10.10.14.0/24 [102] via 10.10.10.11, eth3, Area 0.0.0.0
```

Cost

A route can be made the preferred route by changing its cost. In this example, cost has been configured to make R2 the next hop for R1.

The default cost for each interface is 1. Interface eth2 on R2 has a cost of 100, and Interface eth2 on R3 has a cost of 150. The total cost to reach 10.10.14.0/24 (R4) through R2 and R3 is computed as follows:

R2: 1+100 = 101

R3: 1+150 = 151

Therefore, R1 chooses R2 as its next hop to destination 10.10.14.0/24 because it has the lower cost.

Topology

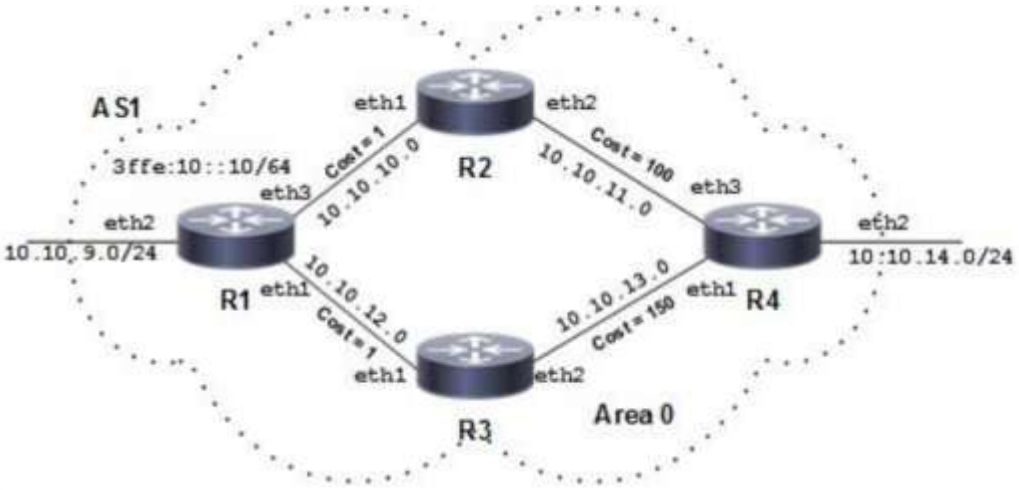

Figure 3-24: Configure Cost Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#network 10.10.9.0/24 area 0`
`(config-router)#network 10.10.10.0/24 area 0`
`(config-router)#network 10.10.12.0/24 area 0`
	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface (area ID `0` specifies the backbone area).

R2

`(config)#interface eth2`	Specify the interface (`eth2`) to configure.
`(config-if)#ip ospf cost 100`	Set the OSPF cost of this link to `100`.
`(config-if)#exit`	Exit interface mode.

`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0` `(config-router)#network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface.

R3

`(config)#interface eth2`	Specify the interface (`eth2`) to configure.
`(config-if)#ip ospf cost 150`	Set the OSPF cost of this link to `100`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.12.0/24 area 0` `(config-router)#network 10.10.13.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface.

R4

`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#network 10.10.11.0/24 area 0`
`(config-router)#network 10.10.13.0/24 area 0`
`(config-router)#network 10.10.14.0/24 area 0`
	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface.

Validation

Virtual Links

Virtual links are used to connect a temporarily-disjointed non-backbone area to the backbone area, or to repair a noncontiguous backbone area. In this example, the ABR R3 has temporarily lost connection to Area 0, in turn, disconnecting Area 2 from the backbone area. The virtual link between ABR R1 and ABR R2 connects Area 2 to Area 0. Area 1 is used as a transit area.

Topology

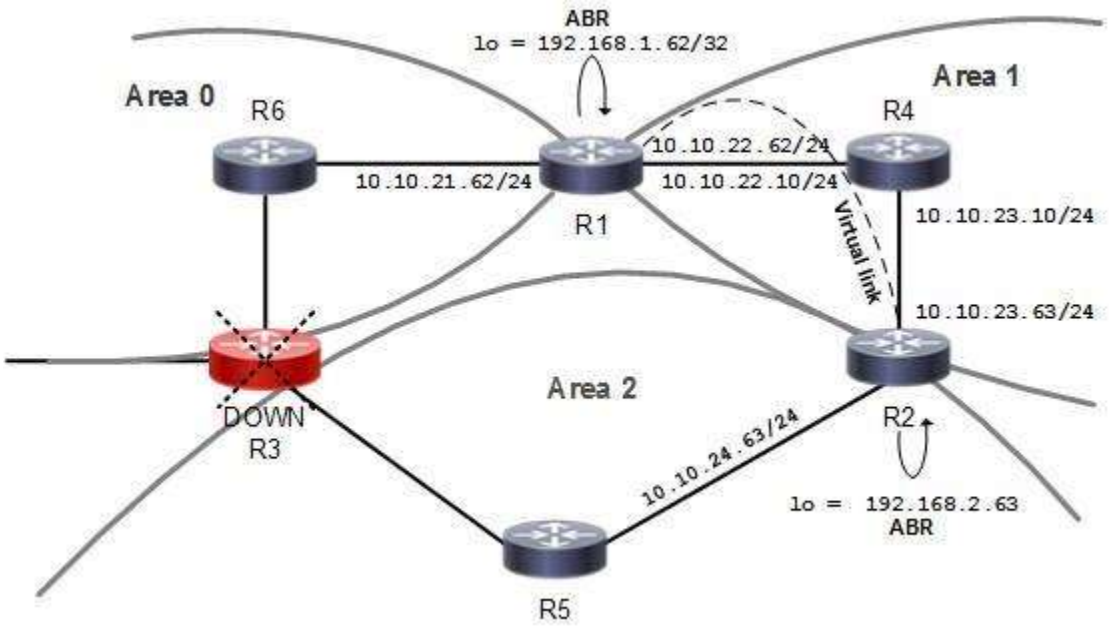

Figure 3-25: Virtual Links Topology

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify loopback as the interface you want to configure.
`(config-if)#ip address 192.168.1.62/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 192.168.1.62`	Configure the OSPF Router ID (`192.168.1.62`) for this router.
`(config-router)#network 10.10.21.0/24 area 0` `(config-router)#network 10.10.22.0/24 area 1`	Define interfaces on which OSPF runs, and associate the area IDs `(0 and 1)` with the interface.
`(config-router)#area 1 virtual-link 192.168.2.63`	Configure a virtual link between this router R1 and R2 (Router ID `192.168.2.63`) through transit area 1.

R2

`(config)#interface lo`	Specify loopback as the interface you want to configure.
`(config-if)#ip address 192.168.2.63/32`	Configure the IP address on this interface.

`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 192.168.2.63`	Configure the OSPF Router ID (`192.168.1.63`) for this router.

`(config-router)#network 10.10.23.0/24 area 1`
`(config-router)#network 10.10.24.0/24 area 2`
`(config-router)#network 192.168.2.63/32 area 2`
	Define interfaces on which OSPF runs, and associate the area IDs `(1` and `2)` with the interface.

`(config-router)#area 1 virtual-link 192.168.1.62`	Configure a virtual link between this router R2 and R1 (Router ID `192.168.2.62`) through transit area `1`.

Validation

show ip ospf virtual-links, show ip ospf neighbor, show ip ospf, show ip ospf route

OSPF Authentication

There are three types of OSPF authentications--Null (Type 0), Simple Text (Type 1), and MD5 (Type 2). With Null authentication, routing exchanges over the network are not authenticated. In Simple Text authentication, the authentication type is the same for all routers that communicate using OSPF in a network. For MD5 authentication, configure a key and a key ID on each router. The router generates a message digest on the basis of the key, key ID, and OSPF packet, and adds it to the OSPF packet.

The authentication type can be configured on a per-interface basis or a per-area basis. Additionally, Interface and Area authentication can be used together. Area authentication is used for an area, and interface authentication is used for a specific interface in the area. If the Interface authentication type is different from the Area authentication type, the Interface authentication type overrides the Area authentication type. If the Authentication type is not specified for an interface, the Authentication type for the area is used. The authentication command descriptions contain details of each type of authentication.

In the example below, R1 and R2 are configured for both the interface and area authentications. The authentication type of interface eth1 on R1 and interface eth0 on R2 is MD5 mode, and is defined by the area authentication command; however, the authentication type of interface eth2 on R1 and interface eth1 on R2 is plain text mode, and is defined by the `ip ospf authentication` command. This interface command overrides the `area authentication` command.

Topology

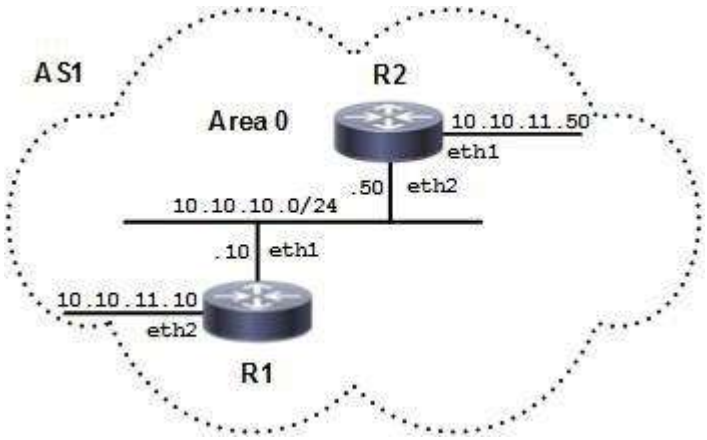

Figure 3-26: OSPF Authentication Topology

R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0` `(config-router)#network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).
`(config-router)#area 0 authentication message-digest`	Enable MD5 authentication on area 0.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure.
`(config-if)#ip ospf message-digest-key 1 md5 test`	Register the MD5 key test for OSPF authentication. The key ID is 1.
`(config-if)#exit`	Exit Interface mode, and return to Configure mode
`(config)#interface eth2`	Specify the interface (`eth2`) to configure.
`(config-if)#ip ospf authentication`	Enable the OSPF packet to use text authentication on the current interface (`eth2`).
`(config-if)#ip ospf authentication-key test`	Specify an OSPF authentication password (`test`) for the neighboring routers.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0` `(config-router)#network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).
`(config-router)#area 0 authentication message-digest`	Enable MD5 authentication on area 0.

(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#interface eth2	Specify the interface (eth0) to configure.
(config-if)#ip ospf message-digest-key 1 md5 test	Register MD5 key test for OSPF authentication. The key ID is 1.
(config-if)#exit	Exit interface mode.
(config)#interface eth1	Specify the interface (eth2) to configure.
(config-if)#ip ospf authentication	Enable the OSPF packet to use text authentication on the current interface (eth1).
(config-if)#ip ospf authentication-key test	Specify an OSPF authentication password test for the neighboring routers.

Multiple OSPF Instances

By using multiple OSPF instances, OSPF routes can be segregated, based on their instance number. Routes of one instance are stored differently from routes of another instance running in the same router.

To configure multiple OSPF instances, perform the following procedures referring to the topology diagram below:

1. Enable OSPF on an interface.
2. Enable multiple instances.
3. Configure redistribution among multiple instances.

   Note: Optionally, redistribution can be configured with the metric, type or route-map options.

Topology

Figure 3-27: Multiple OSPF Instances

Enable Multiple OSPF Instances on a Router

In this example, routers R1, R2, and R3 are in Area 0, and all run OSPF.

R1

`(config)#interface eth1`	Enter the Interface mode for `eth1`.
`(config-if)#ip address 2.2.2.2/24`	Specify the IP address of the interface.
`(config-if)#no shutdown`	Activate the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 10`	Configure an OSPF instance with an instance ID of `10`.
`(config-router)#router-id 5.5.5.5`	Configure the router ID to use on this instance.
`(config-router)#network 2.2.2.0/24 area 0`	Advertise the network with the area ID.

R2

`(config)#interface eth1`	Enter the Interface mode for `eth1`.
`(config-if)#ip address 2.2.2.3/24`	Specify the IP address of the interface.
`(config-if)#no shutdown`	Activate the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 10`	Configure an OSPF instance with an instance ID of `10`.
`(config-router)#router-id 6.6.6.6`	Configure the router ID to use on this instance.
`(config-router)#network 2.2.2.0/24 area 0`	Advertise the network with the area ID.
`(config-router)#exit`	Exit router mode.
`(config)#interface eth2`	Enter the Interface mode for `eth2`.
`(config-if)#ip address 4.4.4.4/24`	Configure the IP address.
`(config-if)#no shutdown`	Activate the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 15`	Configure an OSPF instance with an instance ID of `15`.
`(config-router)#router-id 8.8.8.8`	Configure the router ID to use on this instance.
`(config-router)#network 4.4.4.0/24 area 0`	Advertise the network with the area ID.

R3

`(config)#``interface eth1`	Enter the Interface mode for `eth1`.
`(config-if)#``ip address 4.4.4.5/24`	Configure the IP address.
`(config-if)#``no shutdown`	Activate the interface.
`(config-if)#``exit`	Exit interface mode.
`(config)#``router ospf 15`	Configure an OSPF instance with an instance ID of `15`.
`(config-router)#``router-id 7.7.7.7`	Configure the router ID to use on this instance.
`(config-router)#``network 4.4.4.0/24 area 0`	Advertise the network with the area ID.

Redistribute among Multiple Instances

In this example, routes of one instance are redistributed to another instance to enable ping from R1 to R3 or vice versa; and R2 redistributes routes from one instance to another.

R2

`(config)#router ospf 15`	Configure an OSPF instance with instance ID `15`.
`(config-router)#router-id 8.8.8.8`	Configure the router ID.
`(config-router)#redistribute ospf 10`	Redistribute instance `10` routes.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `15`.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 10`	Configure an OSPF instance with instance ID `10`.
`(config-router)#router-id 6.6.6.6`	Configure the router ID.
`(config-router)#redistribute ospf 15`	Redistribute instance `15` routes.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `10`.

Redistribution with the Metric Option

In this example, on R3, R1 and R2 have each other's routes with a metric of 100.

R2

(config)#router ospf 15	Configure an OSPF instance with instance ID 15.
(config-router)#router-id 8.8.8.8	Configure the router ID.
(config-router)#redistribute ospf 10 metric 100	Redistribute instance 10 routes with metric 100.
(config-router)#redistribute connected	Redistribute connected routes to instance 15.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#router ospf 10	Configure an OSPF instance with instance ID 10.
(config-router)#router-id 6.6.6.6	Configure the router ID.
(config-router)#redistribute ospf 15 metric 100	Redistribute instance 15 routes with metric 100.
(config-router)#redistribute connected	Redistribute connected routes to instance 10.

Redistribution with the Type Option

In this example, on R3, R1 has R3 routes as type 2, and R2 has R1 routes as type 1.

R2

(config)#router ospf 15	Configure an OSPF instance with instance ID 15.
(config-router)#router-id 8.8.8.8	Configure the router ID.
(config-router)#redistribute ospf 10 metrictype 1	Redistribute instance 10 routes with metric-type 1.
(config-router)#redistribute connected	Redistribute connected routes to instance 15.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#router ospf 10	Configure an OSPF instance with instance ID 10.
(config-router)#router-id 6.6.6.6	Configure the router ID.
(config-router)#redistribute ospf 15 metrictype 2	Redistribute instance 15 routes with type 2.
(config-router)#redistribute connected	Redistribute connected routes to instance 10.

Redistribution with the Route-Map Option

R2

(config)#route-map 1 permit 10	Enter route-map mode, specifying route-map ID.
(config-route-map)#set metric 100	Set metric value.
(config-route-map)#set metric-type type-2	Set metric-type.
(config-route-map)#exit	Exit route-map mode.
(config)#route-map 2 permit 10	Enter route-map mode, specifying route-map ID.
(config-route-map)#set metric 200	Set metric value.
(config-route-map)#set metric-type type-1	Set metric-type.
(config-route-map)#exit	Exit route-map mode.

(config)#router ospf 15	Configure an OSPF instance with instance ID 15.
(config-router)#router-id 8.8.8.8	Configure the router ID.
(config-router)#redistribute ospf 10 routemap 1	Redistribute instance 10 routes with route map 1.
(config-router)#redistribute connected	Redistribute connected routes to instance 15.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#router ospf 10	Configure an OSPF instance with instance ID 10.
(config-router)#router-id 6.6.6.6	Configure the router ID.
(config-router)#redistribute ospf 15 routemap 2	Redistribute instance 15 routes with route map 2.
(config-router)#redistribute connected	Redistribute connected routes to instance 10.

Multiple OSPF Instances on Same Subnet

Multiple OSPF instances can be configured on the same subnet. The OSPF instance ID supports separate OSPFv2 protocol instances. With this feature, an adjacency is formed only if the received packet's instance ID is the same as the instance ID configured for that interface.

Topology

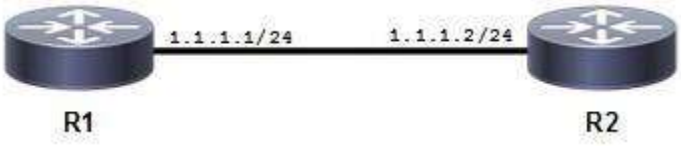

Figure 3-28: Multiple Instances on the Same Subnet

Configuration

R1

#configure terminal	Enter configure mode.
(config)#enable ext-ospf-multi-inst	Enable multiple-instance capability.
(config)#router ospf 1	Configure an OSPF instance with an instance ID of 1.
(config-router)#network 1.1.1.0/24 area 0 instance-id 1	Advertise the network in Area 0 with an instance ID of 1.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#router ospf 2	Configure an OSPF instance with an instance ID of 2.
(config-router)#network 1.1.1.0/24 area 0 instance-id 2	Advertise the network in Area 0 with an instance ID of 2.

(config-router)#exit	Exit Router mode, and return to Configure mode.

R2

#configure terminal	Enter configure mode.
(config)#enable ext-ospf-multi-inst	Enable multiple-instance capability.
(config)#router ospf 1	Configure an OSPF instance with an instance ID of 1.
(config-router)#network 1.1.1.0/24 area 0 instance-id 1	Advertise the network in Area 0 with an instance ID of 1.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#router ospf 2	Configure an OSPF instance with an instance ID of 2.
(config-router)#network 1.1.1.0/24 area 0 instance-id 2	Advertise the network in Area 0 with an instance ID of 2.
(config-router)#exit	Exit Router mode, and return to Configure mode.

Multi-Area Adjacency Configuration

Multiple OSPF areas for a same subnet can be configured between two routers. In the diagram below, OSPF is enabled between R2 and R3 under area 0 and area 1, though there is only one link available between these two routers. Multi-area adjacency allows establishing adjacency on multiple areas between the Area Border Routers (ABRs). The specified interface of the ABR is associated with multiple areas.

Each multi-area-adjacency internally implements point-to-point functionality, once the adjacency reaches the FULL state. This point-to-point link provides a topological path for that area. Like a virtual link, there is no restriction for multi-area adjacency that the packets always go through the backbone.

Topology

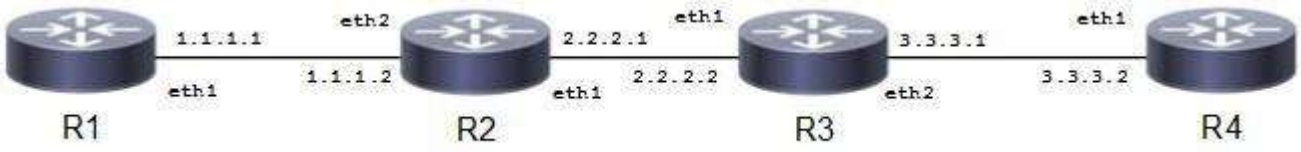

Figure 3-29: One Subnet with Multiple OSPF Areas

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of `1`.
`(config-router)#network 1.1.1.0/24 area 1`	Configure OSPF between R1 and R2 under area `1`.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of `1`.
`(config-router)#network 1.1.1.0/24 area 1`	Configure OSPF between R1 and R2 under area `1`.

(config-router)#network 2.2.2.0/24 area 0	Configure OSPF between R2 and R3 under area 0.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip address 2.2.2.1/24	Configure IP address on the interface.
(config-if)#ip ospf 1 multi-area 0.0.0.1 neighbor 2.2.2.2	Configure multi area adjacency.
(config-if)#exit	Exit interface mode, and return to Configure mode.

R3

#configure terminal	Enter configure mode.
(config)#router ospf 1	Configure an OSPF instance with an instance ID of 1.
(config-router)#network 2.2.2.0/24 area 0	Configure OSPF between R2 and R3 under area 0.
(config-router)#network 3.3.3.0/24 area 1	Configure OSPF between R3 and R4 under area 1.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip address 2.2.2.2/24	Configure IP address on the interface.
(config-if)#ip ospf 1 multi-area 0.0.0.1 neighbor 2.2.2.1	Configure multi area adjacency.
(config-if)#exit	Exit interface mode, and return to Configure mode.

R4

#configure terminal	Enter configure mode.
(config)#router ospf 1	Configure an OSPF instance with an instance ID of 1.
(config-router)#network 3.3.3.0/24 area 1	Configure OSPF between R3 and R4 under area 1.
(config-router)#exit	Exit Router mode, and return to Configure mode.

LSA Throttling

This section contains basic OSPF LSA throttling configuration examples.

The OSPF Link-State Advertisement (LSA) throttling feature provides a mechanism to dynamically slow down link-state advertisement (LSA) updates in OSPF during times of network instability. It also allows faster OSPF convergence by providing LSA rate limiting in milliseconds, when network is stable.

How OSPF LSA Throttling Works

The `timers throttle lsa all` command controls the generation (sending) of LSAs. The first LSA is always generated immediately upon an OSPF topology change, and the next LSA generated is controlled by the minimum start interval. The subsequent LSAs generated for the same LSA are rate-limited until the maximum interval is reached.

The “same LSA” is defined as an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID.

The `timers lsa arrival` command controls the minimum interval for accepting the same LSA. If an instance of the same LSA arrives sooner than the interval that is set, the LSA is dropped. It is recommended that the arrival interval be less than or equal to the hold-time interval of the `timers throttle lsa all` command.

Topology

The diagram shows the minimum configuration required to enable OSPF LSA Throttling Timers feature. R1 and R2 are two routers in Area 0 connecting to network 10.10.10.0/24.

Note: Configure one interface so that it belongs to only one area. It is possible, however, to configure different interfaces on a router to belong to different areas.

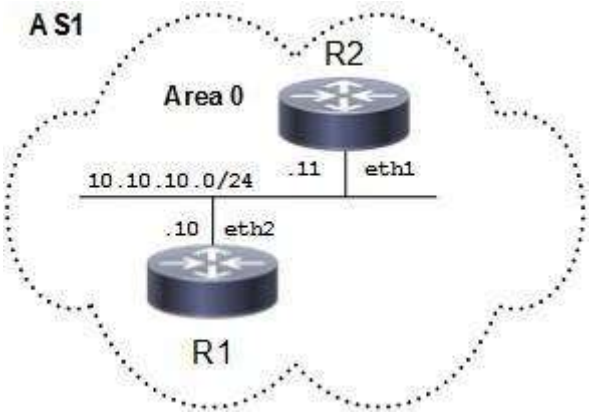

Figure 3-30: Basic OSPF Topology

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the interface loopback to configure.
`(config-if)#ip address 1.1.1.1/32`	Configure the ip address (1.1.1.1) to interface loopback.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (`1`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface (`1.1.1.1/32`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).

(config-router)#timers throttle lsa all 10000 20000 45000	Configure LSA Throttling timers (Starting interval: <0-600000>, Min Hold Interval: <1-600000> and Max Wait Interval:< 1-600000>) in milliseconds. The Default value for corresponding timers are: Starting interval: 0, Min Hold Interval: 5 sec and Max Wait Interval: 5 sec.
(config-router)#end	Exit router mode

R2

#configure terminal	Enter configure mode.
(config)#router ospf 1	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 10.10.10.0/24 area 0	Define the interface (10.10.10.0/24) on which OSPF runs, and associate the area ID (0) with the interface.

Validation

R1

Check the output of show ip ospf and verify the initial throttle delay, minimum hold time for LSA throttle and maximum wait time for LSA throttle.

```
#show ip ospf 1
 Routing Process "ospf 1" with ID 4.1.1.1
 Process uptime is 1 minute
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
 Supports only single TOS(TOS0) routes Supports opaque LSA

 Supports Graceful Restart
 This router is an ASBR (injecting external routing information)
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incomming current DD exchange neighbors 0/5
 Number of outgoing current DD exchange neighbors 0/5
 Initial LSA throttle delay 10 secs 0 msecs
 Minimum hold time for LSA throttle 20 secs 0 msecs
 Maximum wait time for LSA throttle 45 secs 0 msecs
 Minimum LSA arrival 1 secs 0 msecs
 Number of external LSA 5. Checksum 0x010632
 Number of opaque AS LSA 0. Checksum 0x000000 Number of
non-default external LSA 5
 External LSA database is unlimited.
 Number of LSA originated 6
 Number of LSA received 0
 Number of areas attached to this router: 1
    Area 0 (BACKBONE)
        Number of interfaces in this area is 1(1)
        Number of fully adjacent neighbors in this area is 0
```

```
        Area has no authentication
        SPF algorithm last executed 00:00:47.558
        ago SPF algorithm executed 2 times Number
        of LSA 1. Checksum 0x0041e0
```

Check the output of show ip ospf neighbor and verify that OSPF adjacency is up.

```
#sh ip ospf neighbor

OSPF process 1:
Neighbor ID     Pri   State           Dead Time   Address         Interface Inst
ance ID
10.12.49.102      1   Full/DR         00:00:38    10.10.10.10     eth2       0
```

Enable ospf database-timer rate-limit debugging to verify the LSA refresh being sent according to configured LSA throttling timers. #debug ospf database-timer rate-limit

```
#show debugging ospf
OSPF debugging status:
  OSPF rate limit timer events debugging is on
```

Perform shut/no shut based on LSA throttling timers and check if the LSA refresh are sent accordingly.

```

Configure OSPF LSA Arrival Timers

The diagram shows the minimum configuration required to enable OSPF Minimum LSA Arrival Timers feature. R1 and R2 are two routers in Area 0 connecting to network 10.10.10.0/24.

Note: Configure one interface so that it belongs to only one area. It is possible, however, to configure different interfaces on a router to belong to different areas.

Topology

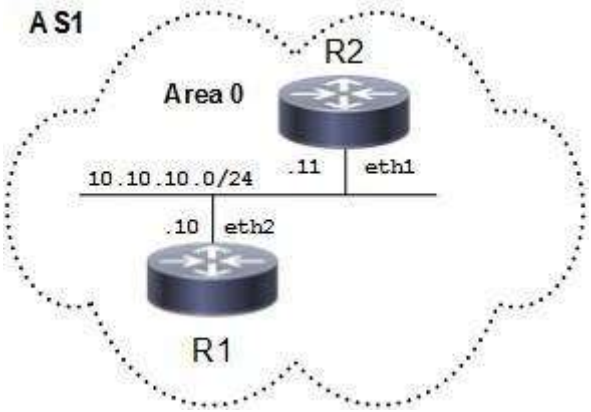

Figure 3-31: Basic OSPF Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the interface loopback to configure.
`(config-if)#ip address 1.1.1.1/32`	Configure the ip address (1.1.1.1) to interface loopback.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (`1`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface (`1.1.1.1/32`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#end`	Exit router mode

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID `(1)`. The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface `(10.10.10.0/24)` on which OSPF runs, and associate the area ID `(0)` with the interface.
`(config-router)#timers lsa arrival 100000`	Configure Minimum LSA Arrival timers (Minimum LSA arrival Interval:< 0-600000>) in milliseconds. The Default value for Minimum LSA Arrival timer is: 1 sec.

Validation

R1

Check the output of `show ip ospf` and verify that the minimum LSA arrival timer by default is set to 1 sec.

```
#show ip ospf
 Routing Process "ospf 1" with ID 4.1.1.1
 Process uptime is 2 hours 26 minutes
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
 Supports only single TOS(TOS0) routes Supports opaque LSA

 Supports Graceful Restart
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incomming current DD exchange neighbors 0/5
 Number of outgoing current DD exchange neighbors 0/5
 Initial LSA throttle delay 0 secs 0 msecs
 Minimum hold time for LSA throttle 5 secs 0 msecs
 Maximum wait time for LSA throttle 5 secs 0 msecs
 Minimum LSA arrival 1 secs 0 msecs
 Number of external LSA 0. Checksum 0x000000
 Number of opaque AS LSA 0. Checksum 0x000000 Number
of non-default external LSA 0
 External LSA database is unlimited.
 Number of LSA originated 3
 Number of LSA received 24
 Number of areas attached to this router: 1
    Area 0 (BACKBONE)
        Number of interfaces in this area is 5(5)
        Number of fully adjacent neighbors in this area is 1
        Area has no authentication
        SPF algorithm last executed 02:23:11.479
        ago SPF algorithm executed 8 times Number
        of LSA 7. Checksum 0x04136d
```

Check the output of `show ip ospf neighbor` and verify that OSPF adjacency is up.

```
#show ip ospf neighbor

OSPF process 1:
Neighbor ID      Pri   State           Dead Time   Address         Interface
Inst ance ID
10.12.49.102       1   Full/DR         00:00:39    10.10.10.10     eth2       0
```

R2

Check the output of `show ip ospf` and verify that the minimum LSA arrival timer is set to 100 sec.

```
#show ip ospf
 Routing Process "ospf 1" with ID 10.12.49.102
```

```
 Process uptime is 2 hours 28 minutes
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
 Supports only single TOS(TOS0) routes Supports opaque LSA

 Supports Graceful Restart
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incomming current DD exchange neighbors 0/5
 Number of outgoing current DD exchange neighbors 0/5
 Initial LSA throttle delay 0 secs 0 msecs
 Minimum hold time for LSA throttle 5 secs 0 msecs
 Maximum wait time for LSA throttle 5 secs 0 msecs
 Minimum LSA arrival 100 secs 0 msecs Number
 of external LSA 0. Checksum 0x000000
 Number of opaque AS LSA 0. Checksum 0x000000 Number
of non-default external LSA 0
 External LSA database is unlimited.
 Number of LSA originated 6
 Number of LSA received 29
 Number of areas attached to this router: 1
    Area 0 (BACKBONE)
        Number of interfaces in this area is 1(1)
        Number of fully adjacent neighbors in this area is 1
        Area has no authentication
        SPF algorithm last executed 02:25:31.431
        ago SPF algorithm executed 11 times Number
        of LSA 7. Checksum 0x04116e
```

Check the output of show ip ospf neighbor and verify that OSPF adjacency is up.

```
#show ip ospf neighbor

OSPF process 1:
Neighbor ID      Pri   State           Dead Time   Address         Interface
Instance ID
4.1.1.1            1   Full/Backup     00:00:37    10.10.10.11     eth1       0
```

Check the output of “show ip ospf database” and verify that LSA is accepted only after a time difference of 100 sec between two consecutive LSAs.

```
#sh ip ospf database

CHAPTER 4 OSPFv3

This chapter contains basic OSPFv3 configuration examples.

For details about the commands used in these examples, see the *Open Shortest Path First Command Reference*.

Enable OSPFv3 on an Interface

This example shows the minimum configuration required for enabling OSPFv3 on an interface. R1 and R2 are two routers in Area 0 connecting to the network 3ffe:10::/64. After enabling OSPFv3 on an interface, create a routing instance, and specify the Router ID.

Note: You must explicitly specify a Router ID for the OSPFv3 process to be activated.

Topology

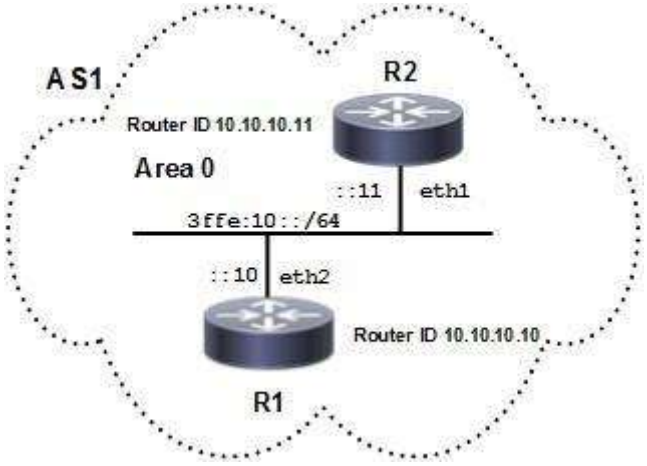

Figure 4-32: Basic OSPFv3 Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.10`	Specify a Router ID for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `0`.

R2

`#configure terminal`	Enter configure mode.

(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 10.10.10.11	Specify a Router ID (10.10.10.11) for the OSPFv3 routing process.
(config-router)#exit	Exit OSPF router mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).

Validation

R1

```
#show ipv6 ospf neighbor

--
```

Set Priority

This example shows how to set priority for an interface. Set a high priority for a router to make it the Designated Router (DR). Router R3 is configured with a priority of 10; this is higher than the default priority (default priority is 1) set for R1 and R2. This makes R3 the DR.

Topology

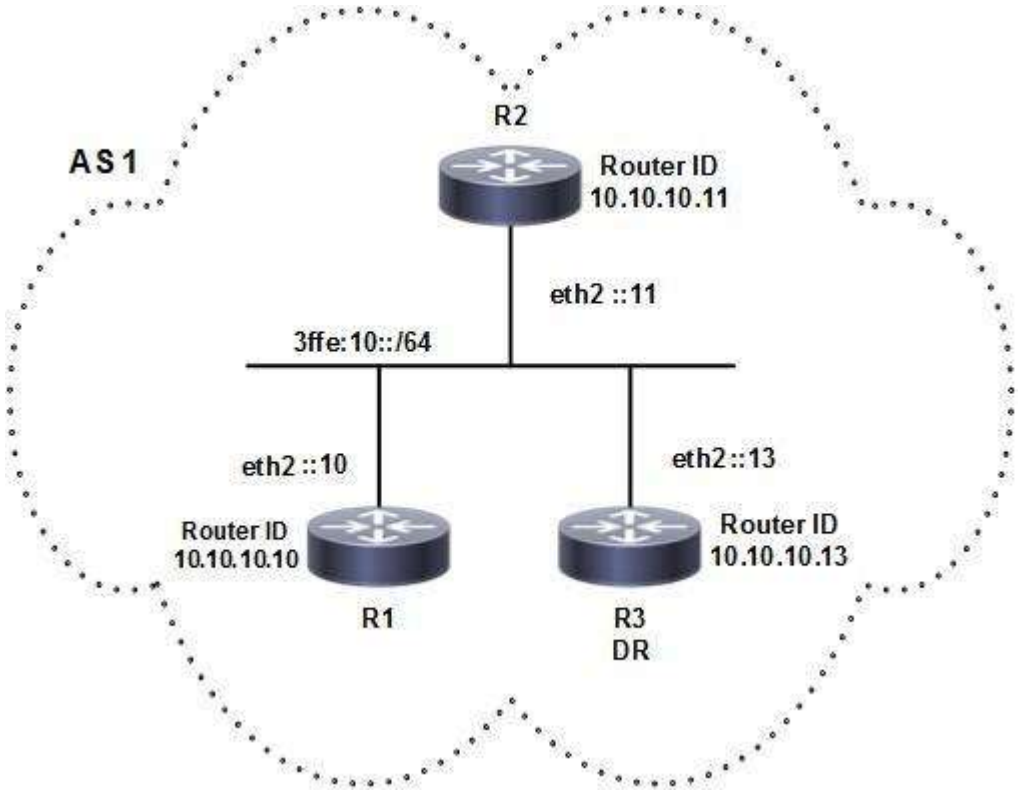

Figure 4-33: OSPFv3 Set Priority

R3

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.13`	Specify a Router ID (`10.10.10.13`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#ipv6 ospf priority 10`	Specify the router priority to a higher priority (10) to make R3 the Designated Router (DR).

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.

(config-router)#router-id 10.10.10.10	Specify a Router ID (10.10.10.10) for the OSPFv3 routing process.
(config-router)#exit	Exit OSPF router mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).

R2

(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 10.10.10.11	Specify a Router ID (10.10.10.11) for the OSPFv3 routing process.
(config-router)#exit	Exit OSPF router mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).

Validation

Area Border Router

This example shows configuration for an Area Border Router. R2 is an Area Border Router (ABR). On R2, interface eth0 is in Area 0, and interface eth1 is in Area 1.

Topology

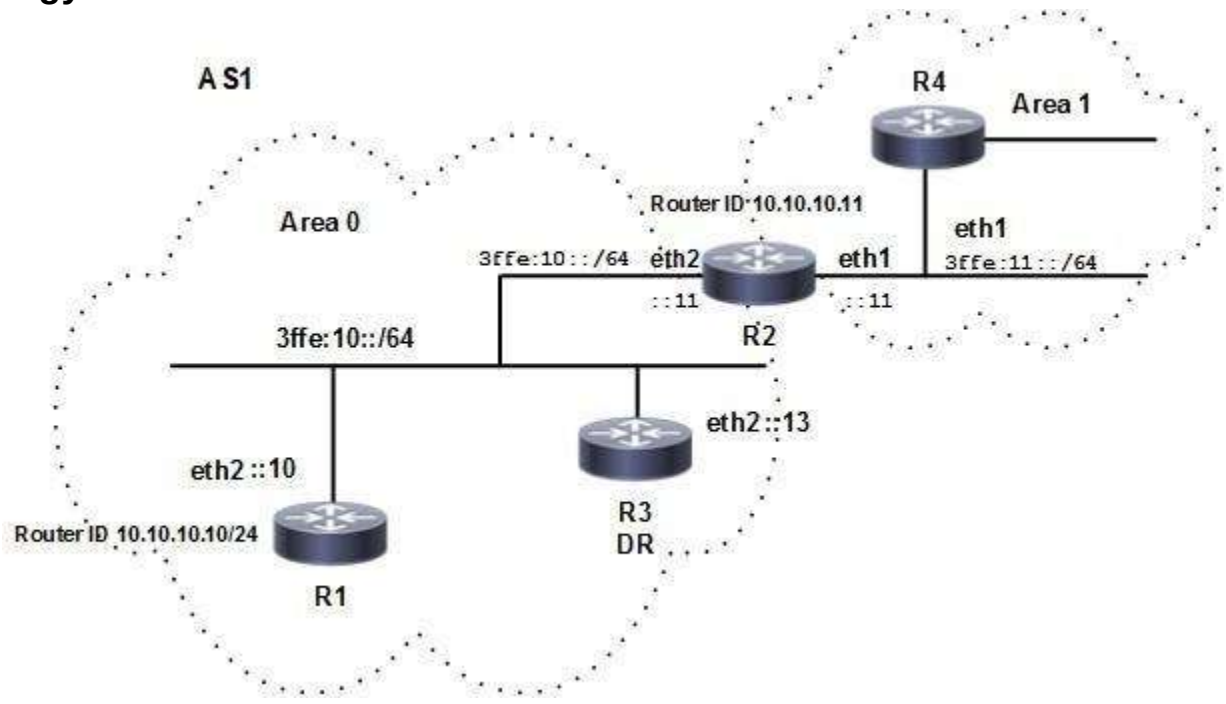

Figure 4-34: OSPFv3 Area Border Router

Configuration

R2

`#configure terminal`	Enter configure mode.

(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 10.10.10.11	Specify a Router ID (10.10.10.11) for the OSPFv3 routing process.
(config-router)#exit	Exit OSPF router mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).
(config-if)#exit	Exit interface mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 1	Enable OSPFv3 routing on the other interface, and assign the other Area ID (1).

Redistribute Routes into OSPFv3

In this example, the BGP routes are imported into the OSPF routing table, and advertised as Type 5 External LSAs into Area 0.

Topology

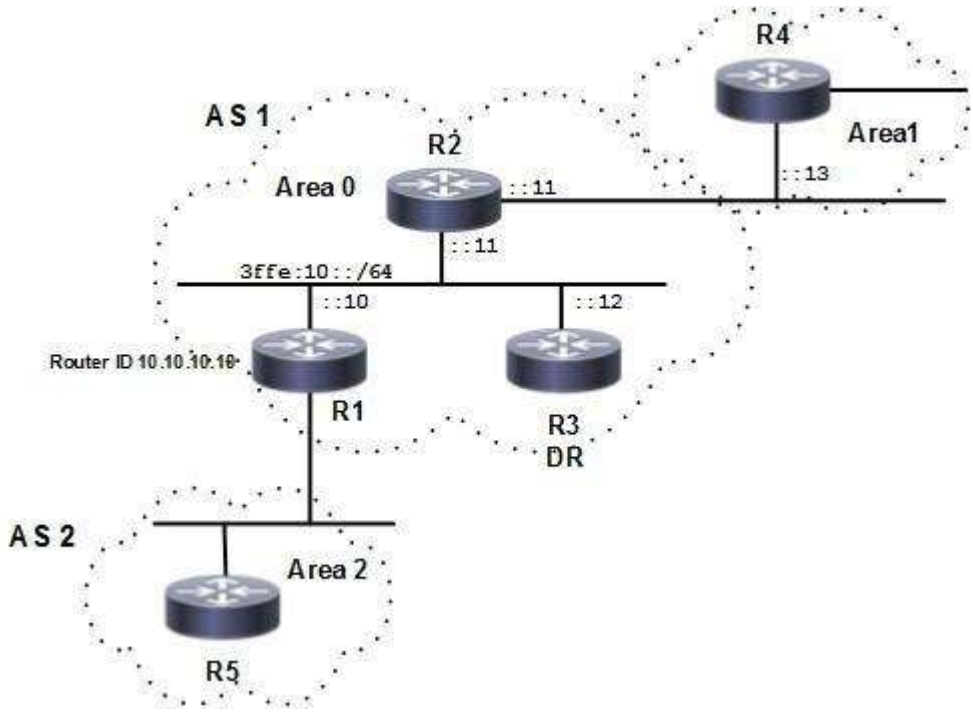

Figure 4-35: OSPFv3 Redistribute Routes

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.10`	Specify a Router ID `(10.10.10.10)` for the OSPFv3 routing process.
`(config-router)#redistribute bgp`	Specify redistributing routes from the other routing protocol (BGP) into OSPFv3.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.

Validation

show ipv6 ospf neighbor, show ipv6 ospf database, show ipv6 ospfv3 topology, show ipv6 ospf route, show ipv6 route

Cost

Make a route the preferred route by changing its cost. In this example, cost has been configured to make R2 the next hop for R1.

The default cost for each interface is 10. Interface eth2 on R2 has a cost of 100, and Interface eth2 on R3 has a cost of 150. The total cost to reach 10.10.14.0/24 (R4) through R2 and R3 is computed as follows:

R2: 10+100 = 110

R3: 10+150 = 160

For this reason, R1 chooses R2 as its next hop to destination 10.10.14.0/24, because it has the lower cost.

Topology

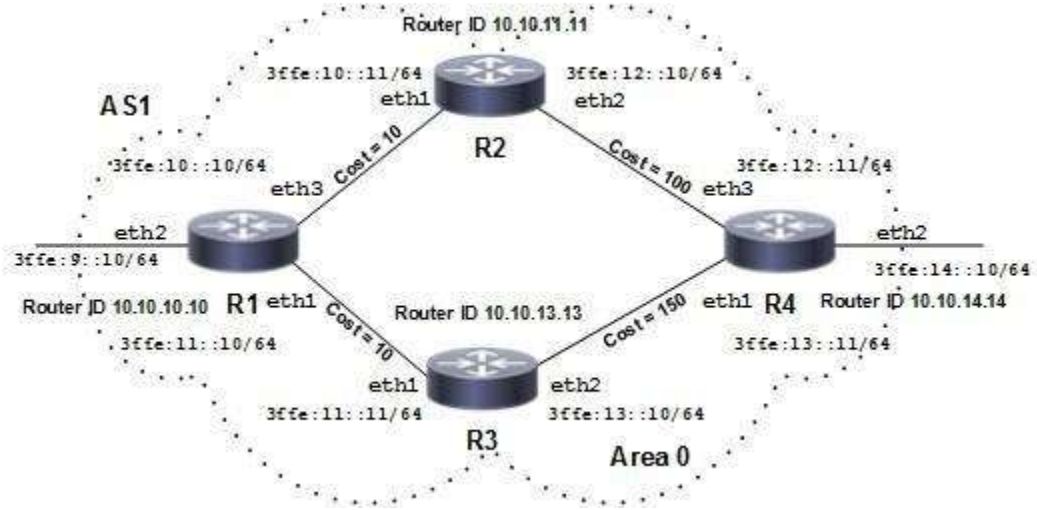

Figure 4-36: Configure Cost OSPFv3

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.10`	Specify a Router ID (`10.10.10.10`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth3`	Specify the interface (`eth3`) to configure, and enter Interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`#configure terminal`	Enter configure mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.

(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).

R2

(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 10.10.11.11	Specify a Router ID (10.10.11.11) for the OSPFv3 routing process.
(config-router)#exit	Exit OSPF router mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).
(config-if)#ipv6 ospf cost 100	Set the cost of the link-state metric (on eth2) to 100.

R3

(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 10.10.13.13	Specify a Router ID (10.10.13.13) for the OSPFv3 routing process.
(config-router)#exit	Exit OSPF router mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).
(config-if)#ipv6 ospf cost 150	Set the cost of link-state metric to 150.

R4

(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 10.10.14.14	Specify a Router ID (10.10.14.14) for the OSPFv3 routing process.
(config-router)#exit	Exit OSPF router mode.
(config)#interface eth3	Specify the interface (eth3) to configure, and enter Interface mode.

(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).
(config-if)#exit	Exit interface mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).

Virtual Links

Virtual links are used to connect a temporarily-disjointed non-backbone area to the backbone area, or to repair a noncontiguous backbone area. In this example, the ABR R3 has temporarily lost connection to Area 0, in turn disconnecting Area 2 from the backbone area. The virtual link between ABR R1 and ABR R2 connects Area 2 to Area 0. Area 1 is used as a transit area.

Topology

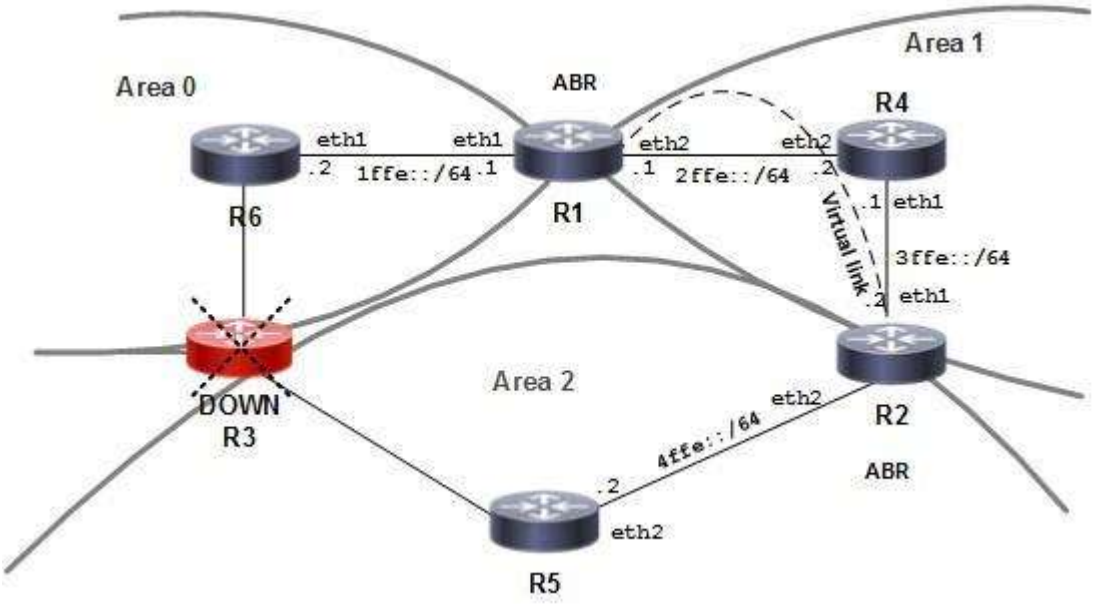

Figure 4-37: OSPFv3 Virtual Links

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on this interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.

(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 1	Enable OSPFv3 routing on this interface, and assign the Area ID (1).
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 1.1.1.1	Specify a Router ID (1.1.1.1) for the OSPFv3 routing process.
(config-router)#area 1 virtual-link 2.2.2.2	Configure a virtual link between this router R1 and R2 (Router ID 2.2.2.2) through transit area 1.

R2

#configure terminal	Enter configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 1	Enable OSPFv3 routing on this interface, and assign the Area ID (1).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 2	Enable OSPFv3 routing on this interface, and assign the Area ID (2).
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 2.2.2.2	Specify a Router ID (2.2.2.2) for the OSPFv3 routing process.
(config-router)#area 1 virtual-link 1.1.1.1	Configure a virtual link between this router R1 and R2 (Router ID 1.1.1.1) through transit area 1.

R4

#configure terminal	Enter configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 1	Enable OSPFv3 routing on this interface, and assign the Area ID (1).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ipv6 router ospf area 1	Enable OSPFv3 routing on this interface, and assign the Area ID (1).
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 4.4.4.4	Specify a Router ID (4.4.4.4) for the OSPFv3 routing process.

R5

`#configure terminal`	Enter configure mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)#ipv6 router ospf area 2`	Enable OSPFv3 routing on this interface, and assign the Area ID `(2)`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 5.5.5.5`	Specify a Router ID (`5.5.5.5`) for the OSPFv3 routing process.

R6

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on this interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 6.6.6.6`	Specify a Router ID (`6.6.6.6`) for the OSPFv3 routing process.

Multiple Instances

By using multiple OSPFv3 instances, OSPFv3 routes can be segregated, based on their instance number. Routes of one instance are stored differently from routes of another instance running in the same router.

To configure multiple OSPFv3 instances, refer to the topology diagram and follow the procedures below.

1. Enable OSPFv3 on an interface.
2. Enable multiple instances.
3. Configure redistribution among multiple instances.

   Note: Optionally, redistribution can be configured with the metric, type, or route-map options.

Topology

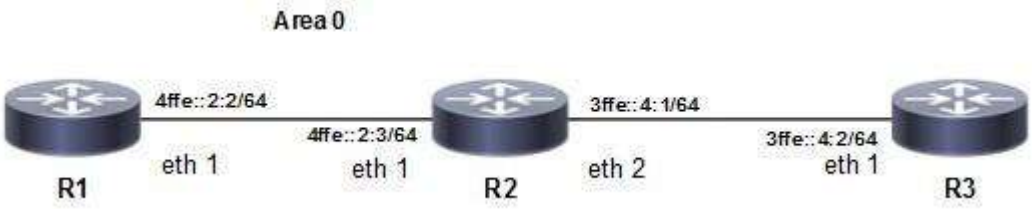

Figure 4-38: Multiple OSPFv3 Instances

Enable OSPFv3 on an Interface

This example shows how to enable OSPFv3 on an interface. R1 and R2 are two routers in Area 0 connecting to network 4ffe::2:/64.

R1

`(config)#router ipv6 ospf 10`	Configure an OSPFv3 instance with an instance ID of `10`.
`(config-router)#router-id 151.151.151.151`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit Router mode, and return to Interface mode.
`(config)#interface eth1`	Specify the interface on which OSPFv3 is to be enabled.
`(config-if)#ipv6 address 4ffe::2:2/64`	Configure the IPv6 address.
`(config-if)#ipv6 router ospf area 0 tag 10`	Configure the area number and instance value: match the instance ID with the instance ID created previously.
`(config-if)#no shutdown`	Activate the interface.

R2

`(config)#router ipv6 ospf 10`	Configure an OSPFv3 instance with an instance ID of `10`.
`(config-router)#router-id 152.152.152.152`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit Router mode, and return to Interface mode.
`(config)#interface eth1`	Specify the interface on which OSPFv3 is to be enabled.
`(config-if)#ipv6 address 4ffe::2:3/64`	Configure the IPv6 address.
`(config-if)#ipv6 router ospf area 0 tag 10`	Configure the area number and instance value: match the instance ID with the instance ID created previously.
`(config-if)#no shutdown`	Activate the interface.

Enable Multiple OSPFv3 Instances on a Router Based on Tags

In this example, routers R1, R2, and R3 are in Area 0, and all run OSPFv3.

R1

`(config)#router ipv6 ospf 5`	Configure an OSPFv3 instance with an instance ID of `5`.

(config-router)#router-id 5.5.5.5	Configure the router ID to use on this instance.
(config-router)#exit	Exit Router mode, and return to Interface mode.
(config)#interface eth1	Specify the interface on which OSPFv3 is to be enabled.
(config-if)#ipv6 address 4ffe::2:2/64	Configure the IPv6 address.
(config-if)#ipv6 router ospf area 0 tag 5	Configure the area number and instance value: match the instance ID with the instance ID created previously.
(config-if)#no shutdown	Activate the interface.

R2

(config)#router ipv6 ospf 5	Configure an OSPFv3 instance with an instance ID of 5.
(config-router)#router-id 149.149.149.149	Configure the router ID to use on this instance.
(config-router)#exit	Exit Router mode, and return to Interface mode.
(config)#interface eth1	Configure the interface to connect to R1.
(config-if)#ipv6 address 4ffe::2:3/64	Configure the IPv6 address.
(config-if)#ipv6 router ospf area 0 tag 5	Configure the area number and instance value: match the instance ID with the instance ID created previously.
(config-if)#no shutdown	Activate the interface.
(config)#router ipv6 ospf 15	Configure an OSPFv3 instance with an instance ID of 15.
(config-router)#router-id 159.159.159.159	Configure the router ID to use on this instance.
(config-router)#exit	Exit Router mode, and return to Interface mode.
(config)#interface eth2	Configure the interface to connect to R3.
(config-if)#ipv6 address 4ffe::4:1/64	Configure the IPv6 address.
(config-if)#no shutdown	Activate the interface.
(config-if)#ipv6 router ospf area 0 tag 15	Configure the area number and instance value: match the instance ID with the instance ID created previously.

R3

(config)#router ipv6 ospf 15	Configure an OSPFv3 instance with an instance ID of 15.
(config-router)#router-id 152.152.152.152	Configure the router ID to use on this instance.
(config-router)#exit	Exit Router mode, and return to Interface mode.
(config)#interface eth1	Specify the interface on which OSPFv3 is to be enabled.
(config-if)#ipv6 address 3ffe::4:2/64	Configure the IPv6 address.
(config-if)#ipv6 router ospf area 0 tag 15	Configure the area number and instance value: match the instance ID with the instance ID created previously.
(config-if)#no shutdown	Activate the interface.

Redistribute among Multiple Instances

In this example, routes of one instance are redistributed to another instance to enable ping from R1 to R3 or vice versa; and R2 redistributes routes from one instance to another.

R2

(config)#router ipv6 ospf 15	Configure an OSPFv3 instance with instance ID 15.
(config-router)#router-id 159.159.159.159	Configure the router ID.
(config-router)#redistribute ospf 5	Redistribute instance 5 routes.
(config-router)#redistribute connected	Redistribute co routes to instance 15.
(config-router)#exit	Exit OSPF router mode.
(config)#router ipv6 ospf 5	Configure an OSPFv3 instance with instance ID 5.
(config-router)#router-id 149.149.149.149	Configure the router ID.
(config-router)#redistribute ospf 15	Redistribute instance 15 routes.
(config-router)#redistribute connected	Redistribute connected routes to instance 5.

Redistribute with Metric Option

In this example, on R3, R1 and R2 have each other's routes with a metric of 100.

R2

`(config)#router ipv6 ospf 15`	Configure an OSPFv3 instance with instance ID `15`.
`(config-router)#router-id 159.159.159.159`	Configure the router ID.
`(config-router)#redistribute ospf 5 metric 100`	Redistribute instance `15` routes with metric `100`.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `15`.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#router ipv6 ospf 5`	Redistribute routes into instance `5`.
`(config-router)#router-id 149.149.149.149`	Configure the router ID.
`(config-router)#redistribute ospf 5 metric 100`	Redistribute instance `15` routes with metric `100`.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `5`.

Redistribute with Route-Map Option

R2

`(config)#router ipv6 ospf 15`	Configure an OSPFv3 instance with instance ID `15`.
`(config-router)#router-id 159.159.159.159`	Configure the router ID.
`(config-router)#redistribute ospf 5 route-map 1`	Redistribute instance `5` routes with route map `1`.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `15`.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#router ipv6 ospf 5`	Redistribute routes into instance `5`.
`(config-router)#router-id 149.149.149.149`	Configure the router ID.
`(config-router)#redistribute ospf 15 routemap 1`	Redistribute instance `15` routes with route map `1`.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `15`.

Graceful Restart

The possibility of maintaining a router's data forwarding capability while the router's control software restarts is called graceful restart or non-stop forwarding. After the router restarts and reloads, it must change its OSPF processing until it re-establishes full adjacencies with all its former fully adjacent neighbors. The time period between the restart/reload and

re-establishment of adjacencies is called the grace period. Essentially, the OSPF procedure for graceful restart is as follows:

- The router attempting a graceful restart originates link-local Opaque-LSAs, called Grace-LSAs, announcing its intention to perform a graceful restart within a specified amount of time (grace period).
- During the grace period, neighbors continue to announce the restarting router in their LSAs as if it were fully adjacent (OSPF neighbor state Full), but only if the network topology remains static (the contents of the LSAs in the link-state database that have LS types 1-5 and 7 remain unchanged, and periodic refreshes are allowed).

Topology

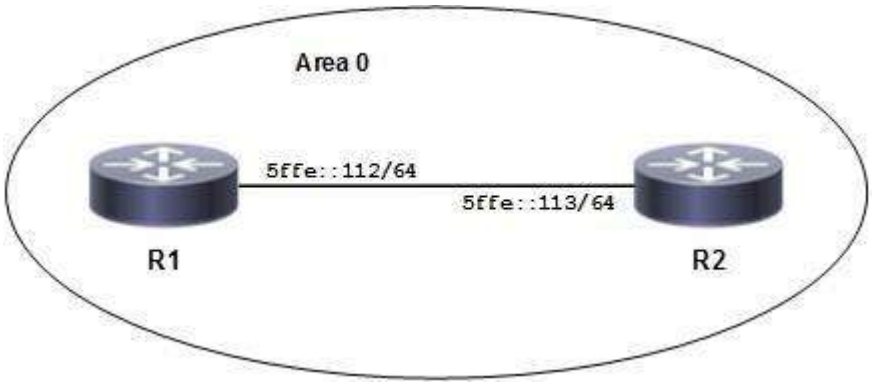

Figure 4-39: OSPFv3 Graceful Restart

Configure R1 for Graceful Restart

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ipv6 address 5ffe::112/64`	Assign the IPv6 address to the interface.
`(config-if)#ipv6 router ospf area 0 tag 1`	Configure the interface for OSPFv3 on area 0.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 1`	Create an OSPFv3 routing instance.
`(config-router)#router-id 1.1.1.1`	Specify a Router ID (`1.1.1.1`) for the OSPFv3 routing process.
`(config-router)#capability restart graceful`	Enable graceful restart capability.
`(config-router)#end`	Exit Configure mode and enter Privileged Exec mode.
`#write`	Save the configuration.
`#restart ipv6 ospf graceful grace-period 200`	Restart OSPFv3 with a 200-second grace period, so that the neighbor maintains adjacency and preserves the routes for 200 seconds.

Configure R2 as Restart Helper

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.

(config-if)#ipv6 address 5ffe::113/64	Assign the IPv6 address to the interface.
(config-if)#ipv6 router ospf area 0 tag 1	Configure the interface for OSPFv3 on area 0.
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 1	Create an OSPFv3 routing instance.
(config-router)#router-id 2.2.2.2	Specify a Router ID (2.2.2.2) for the OSPFv3 routing process.
(config-router)#exit	Exit Router mode and enter Configure mode.
(config)#ipv6 ospf restart helper max-graceperiod 300	Configure R2 to act as the helper when the grace period is less than 300.

Remove Helper Configuration from R2

#configure terminal	Enter configure mode.
(config)#router ipv6 ospf 1	Create an OSPFv3 routing instance.
(config-router)#router-id 1.1.1.1	Specify a Router ID (1.1.1.1) for the OSPFv3 routing process.
(config-router)#exit	Exit Router mode and enter Configure mode.
(config)#ipv6 ospf restart helper never	Configure R2 to not work as the helper.

Make R2 Helper when Restart Reason is Reload

#configure terminal	Enter configure mode.
(config)#router ipv6 ospf 1	Create an OSPFv3 routing instance.
(config-router)#router-id 1.1.1.1	Specify a Router ID (1.1.1.1) for the OSPFv3 routing process.
(config-router)#exit	Exit Router mode and enter Configure mode.
(config)#ipv6 ospf restart helper only-reload	Configure R2 to work as the helper only when the restart reason is reload.

Make R2 Helper when Restart Reason is Upgrade

#configure terminal	Enter configure mode.
(config)#router ipv6 ospf 1	Create an OSPFv3 routing instance.
(config-router)#router-id 1.1.1.1	Specify a Router ID (1.1.1.1) for the OSPFv3 routing process.
(config-router)#exit	Exit Router mode and enter Configure mode.
(config)#ipv6 ospf restart helper onlyupgrade	Configure R2 to work as the helper only when the restart reason is upgrade.

Not-So-Stubby Area

This section contains OSPFv3 NSSA (Not-So-Stubby Area) configuration examples.

An NSSA allows external routes to be advertised into the OSPF autonomous system while retaining the characteristics of a stub area to the rest of the autonomous system. To do this, the ASBR in an NSSA will originate type 7 LSAs to advertise the external destinations. These NSSA external LSAs are flooded throughout the NSSA but are blocked at the ABR.

The NSSA external LSA has a flag in its header known as the P-bit. The NSSA ASBR has the option of setting or clearing the P-bit. If an NSSA's ABR receives a type 7 LSA with the P-bit set to one, it translates the type 7 LSA into a type 5 LSA and floods it throughout the other areas. If the P-bit is set to zero, no translation takes place and the destination in the type 7 LSA is not advertised outside of the NSSA.

Topology

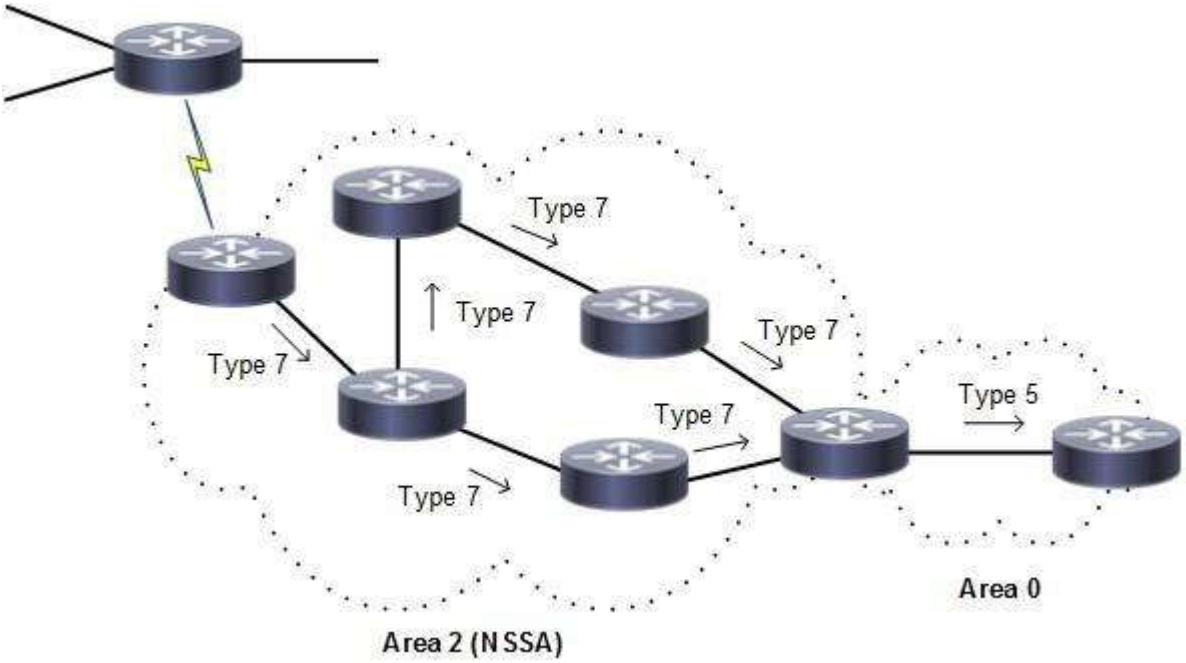

Figure 4-40: Translating Type 7 LSAs into Type 5 LSAs

NSSA with Route Options

This example shows the configuration to enable NSSA and to configure different route options for NSSA. There are three `area nssa` command options for originating default Type-3 LSA and default Type-7 LSA, and for blocking redistribution of Type-7 LSA into an NSSA:

- `no-summary`: The NSSA ABR blocks all type-3 and type-4 LSAs into the NSSA area and sends a single type-3 LSA into the area to advertise a default route
- `default-information-originate`: The NSSA ABR advertises a default route into the NSSA as a type-7 LSA.
- `no-redistribution`: The NSSA ABR bocks type-7 LSA from being redistributed into the NSSA area.

In Figure 4-41, R2 is an NSSA ABR as well as an NSSA ASBR that maps the router interfaces to two different areas and redistributes the connected routes of the loopback interface. Also, this example sets the `no-summary`, `noredistribution`, and `default-information-originate` options on R2 to originate default Type-3 LSAs and default Type-7 LSAs into the NSSA and to block Type-7 LSAs.

Topology

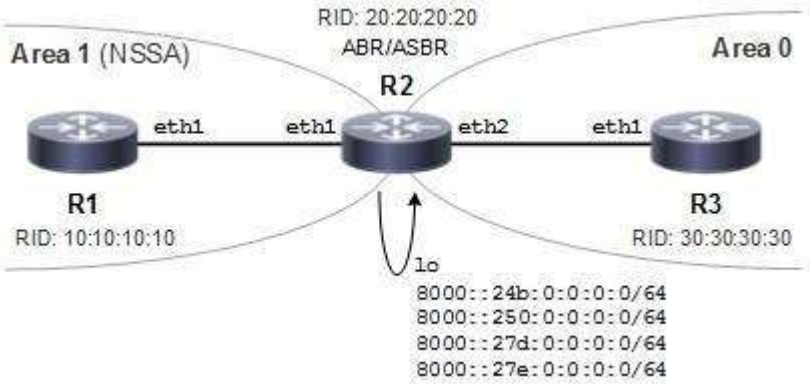

Figure 4-41: NSSA with Route Options

R1

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 10.10.10.10`	Configure the router ID to use on this instance (100)
`(config-router)#area 1 nssa`	Configure area as NSSA
`(config-router)#exit`	Exit interface mode

R2

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode for `eth2`
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in backbone
`(config-if)#interface lo`	Enter interface mode for Loopback
`(config-if)#ipv6 address 8000::24b:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::250:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::27d:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::27e:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 20.20.20.20`	Configure the router ID to use on this instance (100)
`(config-router)#redistribute connected`	Redistribute the configured loopback network into the NSSA

`(config-router)#area 1 nssa no-redistribution default-information-originate no-summary`	Configure the Router to originate default Type-3 LSAs and default Type-7 LSAs, and to block Type-7 LSAs into the NSSA
`(config-router)#exit`	Exit interface mode

R3

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 30.30.30.30`	Configure the router ID to use on this instance (100)
`(config-router)#exit`	Exit interface mode

Validation 1

In the output of `show ipv6 ospf neighbor` below, verify that OSPFv3 adjacency is in state “full” for both R1 and R2 under the process identifier 100.

```
R1#sh ipv6 ospf neighbor
OSPFv3 Process (100)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
20.20.20.20       1   Full/DR         00:00:34    eth2       0

R2#sh ipv6 ospf neighbor
OSPFv3 Process (100)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
10.10.10.10       1   Full/Backup     00:00:38    eth1       0
```

Validation 2

The output below shows originating default Type-3 LSAs into the NSSA with the no-summary option. The advertising router identifier is for R2 (20.20.20.20, the NSSA-ABR). Also, the prefix is ::/0 and the LS-Type is Inter-Area-Prefix-LSA for the default Type-3 LSA route into the NSSA.

```
R1#sh ipv6 ospf database inter-prefix

            OSPFv3 Router with ID (10.10.10.10) (Process 100)

                Inter-Area-Prefix-LSA (Area 0.0.0.1)
  LS age: 1234
  LS Type: Inter-Area-Prefix-LSA
  Link State ID: 0.0.0.6
  Advertising Router: 20.20.20.20
  LS Seq Number: 0x80000001
  Checksum: 0x17D0
  Length: 28
    Metric: 1
    Prefix: ::/0
    Prefix Options: 0
```

Validation 3

The output below shows originating default type-7 LSAs alone after setting the no-redistribution and default-information originate options. The advertising router identifier is for R2 (20.20.20.20, the NSSA-ABR). Also, the prefix is ::/0 and LS-Type is NSSA-external-LSA for the default Type-7 LSA route into the NSSA

```
R1#sh ipv6 ospf database nssa-external

            OSPFv3 Router with ID (10.10.10.10) (Process 100)

                NSSA-external-LSA (Area 0.0.0.1)

  LS age: 1758
  LS Type: NSSA-external-LSA
  Link State ID: 0.0.0.20
  Advertising Router: 20.20.20.20
  LS Seq Number: 0x80000002
  Checksum: 0x6468
  Length: 32
    Metric Type: 2 (Larger than any link state path)
    Metric: 1
    Prefix: ::/0
    Prefix Options: 0 (-|-|-|-)
    External Route Tag: 0
```

NSSA with the Summary Address Option

Figure 4-42 shows the configuration to originate external LSAs (Type-7) and translate them into external LSAs (Type5):

- R1 is an NSSA-ASBR configured with loopback IPv6 addresses that are redistributed into OSPFv3
- R2 is an NSSA-ABR
- R3 is backbone router

R1 originates Type-7 LSAs which are summarized into a single Type-7 into the NSSA by the `summary-address` option and this summarized Type-7 is converted to Type-5 LSA by R2.

Also, the summarized route can be tagged using the `tag` command and the advertisement of summarized routes can be suppressed by the `not-advertise` option.

Topology

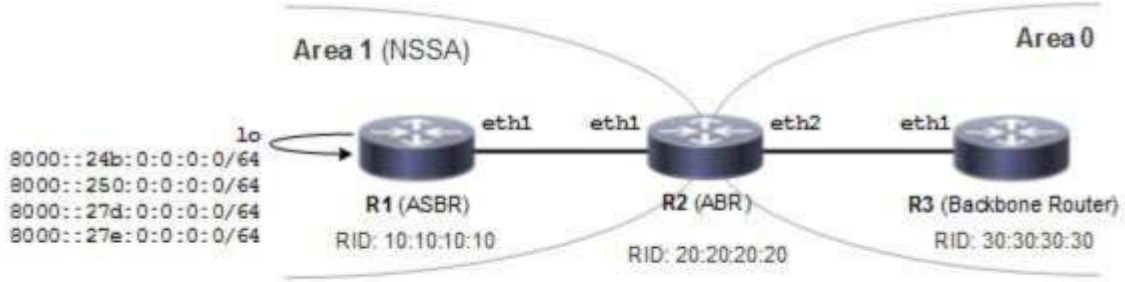

Figure 4-42: Using the summary-address Option

Configuration

R1

(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ipv6 router ospf tag 100 area 1	Configure interface in an area assigned with the area ID (1).
(config-if)#exit	Exit interface mode.
(config-if)#interface lo	Enter interface mode for loopback
(config-if)#ipv6 address 8000::24b:0:0:0:0/64	Assign IPv6 address to loopback interface
(config-if)#ipv6 address 8000::250:0:0:0:0/64	Assign IPv6 address to loopback interface
(config-if)#ipv6 address 8000::27d:0:0:0:0/64	Assign IPv6 address to loopback interface
(config-if)#ipv6 address 8000::27e:0:0:0:0/64	Assign IPv6 address to loopback interface
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 10.10.10.10	Configure the router ID to use on this instance (100)
(config-router)#area 1 nssa	Configure the area as NSSA.
(config-router)#redistribute connected	Redistribute the configured loopback network into OSPFv3 NSSA. Note: Connected networks can be redistributed by setting the metric and metric type.
(config-router)#summary-address 8000::/48 tag 10	Summarize the address range and tag the summarized route
(config-router)#exit	Exit interface mode

R2

(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ipv6 router ospf tag 100 area 1	Configure interface in an area assigned with the area ID (1).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode for eth2
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in backbone area (0)
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 20.20.20.20	Configure the router ID to use on this instance (100)
(config-router)#area 1 nssa	Configure the Router in NSSA
(config-router)#exit	Exit interface mode

R3

(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in backbone area (0)

(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 30.30.30.30	Configure the router ID to use on this instance (100)
(config-router)#exit	Exit interface mode

In the configurations above, you can suppress the external route summarization by NSSA-ASBR by specifying the not-advertise parameter as shown below:

```
(config-router)#summary-address 8000::/48 not-advertise
```

Also, connected networks can be redistributed by setting the metric and metric type as shown below:

```
(config-router)#redistribute connected metric 20 metric-type 1
```

Validation 1

The output below shows the summarized route generated by NSSA-ASBR (R1) with a tag. The output has the LS Type as NSSA-external-LSA with advertising router identifier (10.10.10.10) of the NSSA-ASBR (R1). Also, check the Prefix which is summarized route and external route tag as configured.

```
R1#sh ipv6 ospf database nssa-external

            OSPFv3 Router with ID (10.10.10.10) (Process 100)

NSSA-external-LSA (Area 0.0.0.1)

  LS age: 90
  LS Type: NSSA-external-LSA   Advertising Router:
10.10.10.10
  Link State ID: 0.0.0.11
  LS Seq Number: 0x80000003
  Checksum: 0x69B3
  Length: 40
    Metric Type: 2 (Larger than any link state path)
    Metric: 21
    Prefix: 8000::/48     External Route Tag: 10
    Prefix Options: 8 (P|-|-|-)
```

Validation 2

```
The output below on the NSSA-ABR that is translating Type-7 LSAs to Type-5
LSAs shows summarized address in Type-7 and Type-5 LSA. Check for the
same prefix, external route tag in both Type7 and Type-5 LSA. R2#sh ipv6
ospf database nssa-external

            OSPFv3 Router with ID (20.20.20.20) (Process 100)

                NSSA-external-LSA (Area 0.0.0.1)

  LS age: 241
  LS Type: NSSA-external-LSA
  Link State ID: 0.0.0.11
  Advertising Router: 10.10.10.10
  LS Seq Number: 0x80000003
```

```
  Checksum: 0x69B3
  Length: 40
    Metric Type: 2 (Larger than any link state path)
    Metric: 21
    Prefix: 8000::/48
    Prefix Options: 8 (P|-|-|-)
External Route Tag: 10

R2#sh ipv6 ospf database external

            OSPFv3 Router with ID (20.20.20.20) (Process 100)

                AS-external-LSA

  LS age: 245
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.3
  Advertising Router: 20.20.20.20
  LS Seq Number: 0x80000003
  Checksum: 0x8660
  Length: 40
    Metric Type: 2 (Larger than any link state path)
    Metric: 21
    Prefix: 8000::/48
    Prefix Options: 0 (-|-|-|-)
    External Route Tag: 10
```

Validation 3

The output below on the backbone router shows the summarized address in the translated Type-5 LSA. The prefix and external route tag are the same as the summarized Type-7 LSA originated by R1.

```
R3#sh ipv6 ospf database external

            OSPFv3 Router with ID (30.30.30.30) (Process 100)

                AS-external-LSA

  LS age: 409
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.3
  Advertising Router: 20.20.20.20
  LS Seq Number: 0x80000003
  Checksum: 0x8660
  Length: 40
    Metric Type: 2 (Larger than any link state path)
    Metric: 21
    Prefix: 8000::/48
    Prefix Options: 0 (-|-|-|-)
    External Route Tag: 10
```

NSSA with the Translator Role Option

Type-7 to Type-5 translation is done by an NSSA-ABR. If an NSSA has multiple NSSA-ABRs, only one will perform the translation. The NSSA-ABR translator role options are:

- Candidate (default)
- Always

In the topology in Figure 4-43:

- R1 is NSSA-ASBR
- R2 and R3 are NSSA-ABRs
- R4 is a backbone router

In this example, the NSSA translator role `candidate` is configured on both NSSA-ABRs (R2 and R3). The Type-7 to Type-5 translation is done by the router with the higher router identifier (R3).

Topology

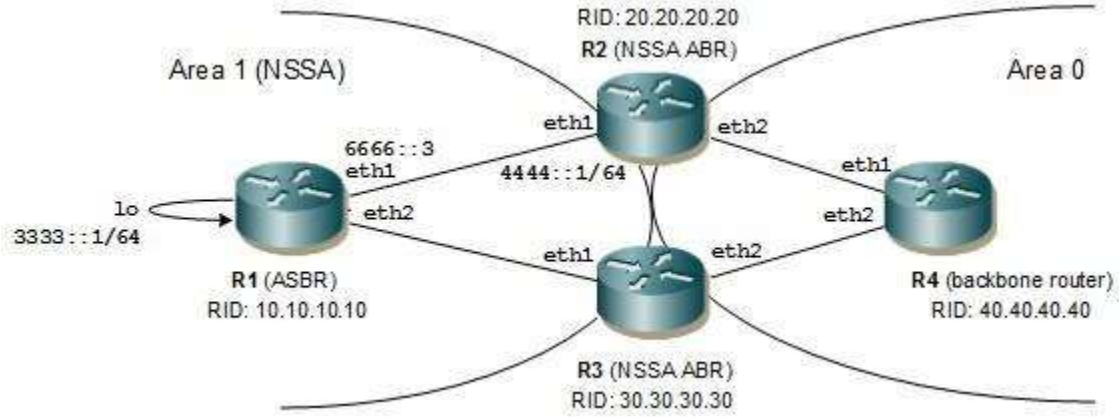

Figure 4-43: Using the translator-role Option

Configuration

When one NSSA-ABR is configured with the translator role as `always` and the other as `candidate`, then translation is done by the router configured as `always`. In this scenario, the translation can be biased by setting the translator role to `always` on the router that has the lower router identifier.

R1

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode for `eth2`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config-if)#interface lo`	Enter interface mode for Loopback
`(config-if)#ipv6 address 3333::1/64`	Assign IPv6 address to loopback interface

(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 10.10.10.10	Configure the router ID to use on this instance (100)
(config-router)#area 1 nssa	Configure the area as NSSA.
(config-router)#redistribute static	Redistribute the static route configured into the OSPF NSSA
(config-router)#redistribute connected	Redistribute the connected network into OSPF NSSA
(config-router)#exit	Exit interface mode
(config)#ipv6 route 4444::1/64 6666::3	Configure the static route with the nexthop address as R2's eth1 IPv6 address
(config)#exit	Exit interface mode.

R2

(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ipv6 router ospf tag 100 area 1	Configure interface in an area assigned with the area ID (1).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode for eth2
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in backbone area (0)
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 20.20.20.20	Configure the router ID to use on this instance (100)
(config-router)#area 1 nssa translator-role candidate	Configure the NSSA-ABR with the translator role candidate.
(config-router)#exit	Exit interface mode

R3

(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ipv6 router ospf tag 100 area 1	Configure interface in an area assigned with the area ID (1).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode for eth2
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in backbone area (0)
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 30.30.30.30	Configure the router ID to use on this instance (100)
(config-router)#area 1 nssa translator-role candidate	Configure the NSSA-ABR with the translator role candidate.
(config-router)#exit	Exit interface mode

R4

(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in backbone area (0)

(config)#interface eth2	Enter interface mode for eth2
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in backbone area (0)
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 40.40.40.40	Configure the router ID to use on this instance (100)
(config-router)#exit	Exit interface mode

The command to configure the NSSA-Translator role as always is:

```
(config-router)#area 1 nssa translator-role always
```

The NSSA-ABR can continue to perform translation after its services are no longer required for the stability interval which is set using the command below on the NSSA-ABR.

```
(config-router)#area 1 nssa stability-interval 7777
```

Validation 1

The translation is done by the NSSA-ABR with the higher router identifier. In the output below, check the router identifier of the NSSA-ABR. Also, check the router which is elected and the router which is disabled.

```
R2#sh ipv6 ospf
 Routing Process "OSPFv3 (100)" with ID

    Metric Type: 2 (Larger than any link state path)
    Metric: 20
```

```
Prefix: 4444::/64
Prefix Options: 0 (-|-|-|-)
Forwarding Address: 6666::3
External Route Tag: 0
```

Link LSA Suppression

If link LSA suppression is enabled and the interface type is not broadcast or NBMA, the router will not originate a linkLSA for the link. This implies that other routers on that link will determine the router's next hop address using a mechanism other than the link LSA.

Topology

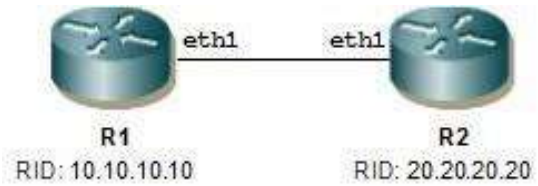

Figure 4-44: LSA Suppression

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100ABC`) which uniquely identifies the routing process.
`(config-router)#router-id 10.10.10.10`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf tag 100-ABC area 1`	Configure interface in an area assigned with the area ID (1). The tag uniquely identifies the routing process.
`(config-if)#ipv6 ospf network point-to-point`	Configure the OSPF interface network type as point to point
`(config-if)#ipv6 ospf link-lsa-suppression enable`	Enable the link LSA suppression mechanism
`(config-if)#exit`	Exit interface mode

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100ABC`) which uniquely identifies the routing process.
`(config-router)#router-id 20.20.20.20`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode

(config-if)#ipv6 router ospf tag 100-ABC area 1	Configure interface in an area assigned with the area ID (1). The tag uniquely identifies the routing process.
(config-if)#ipv6 ospf network point-to-point	Configure the OSPF interface network type as point to point
(config-if)#ipv6 ospf link-lsa-suppression enable	Enable the link LSA Suppression Mechanism
(config-if)#exit	Exit interface mode

Note: This is not applicable for broadcast and NBMA networks.

Validation 1

Verify that adjacency has been established.

```
R1#sh ipv6 ospf neighbor
OSPFv3 Process (100)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
20.20.20.20       1   Full/ -         00:00:37    eth2       0
```

Validation 2

Verify that DUT should not have the Link LSA in the Link state database.

Note: The output below is captured after link lsa suppression enabled which has not Link LSA in the LSDB.

```
DUT#sh ipv6 ospf database

            OSPFv3 Router with ID (10.10.10.10) (Process 100)

```

Address Family IPv4 Unicast Configuration

This chapter contains basic OSPFv3 address family IPv4 unicast configuration examples.

The address family feature lets OSPFv3 IPv6 networks support both IPv6 and IPv4 unicast traffic. It uses multiple instance identifiers to support multiple address families. By default OSPFv3 supports only IPv6 unicast traffic.

The purpose of supporting address families in OSPFv3 is to advertise IPv4 unicast address family routes in OSPFv3 by assigning different instance identifier ranges to different address families. With this feature, users may have two router processes per interface, but only one process per address family. Each instance identifier implies a separate OSPFv3 instance with its own neighbor adjacencies, link state database, and SPF computation. A single IPv4 or IPv6 OSPFv3 process running multiple instances on the same interface is not supported.

Enable Address Family IPv4 Unicast

The diagram below shows the minimum configuration required to enable the OSPFv3 address family feature and to establish the adjacency between R1 and R2 to support the IPv4 address family.

Note: To enable the IPv4 unicast address family in an OSPFv3 router, you need to configure an IPv4 address on the OSPFv3 enabled interface.

Topology

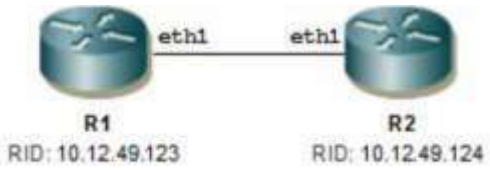

Figure 4-45: IPv4 Address Family on OSPFv3

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100ABC`) which uniquely identifies the routing process.
`(config-router)#router-id 10.12.49.123`	Configure the router ID to use for this process .
`(config-router)#address-family ipv4 unicast`	Enable the ipv4 address family
`(config-router-af)#exit-address-family`	Exit Router AF configuration mode
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64`	Configure the interface in area 0. The tag uniquely identifies the routing process and the instance identifier is 64-95 for the IPv4 address family
`(config-if)#exit`	Exit interface mode

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100ABC`) which uniquely identifies the routing process.
`(config-router)#router-id 10.12.49.124`	Configure the router ID to use on this tag.

`(config-router)#address-family ipv4 unicast`	Enable the ipv4 address family
`(config-router-af)#exit-address-family`	Exit Router AF configuration mode
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64`	Configure the interface in area 0. The tag uniquely identifies the routing process and the instance identifier is 64-95 for the IPv4 address family
`(config-if)#end`	Exit interface mode

Note: Use the process identifier to tag the interface, The instance identifier should be same on R1 and R2. In the above example, the process identifiers (`100-ABC`) and the instance identifiers are the same (64).

Validation

Verify that adjacency has been established with the configured instance identifier.

```
R2#sh ipv6 ospf neighbor
OSPFv3 Process (1)
Neighbor ID     Pri    State           Dead Time    Interface Instance ID
10.12.49.123      1    Full/DR         00:00:37    eth1            64

R2#sh ipv6 ospf interface eth1 eth1
is up, line protocol is up
  Interface ID 3
  IPv6 Prefixes
    fe80::5054:ff:fe4e:32d1/64 (Link-Local Address)
  OSPFv3 Process (1), Area 0.0.0.0, Instance ID 64
    Router ID 10.12.49.124, Network Type BROADCAST, Cost: 1, TE Metric:
    0 Transmit Delay is 1 sec, State Backup, Priority 1
    Designated Router (ID) 10.12.49.123
      Interface Address fe80::5054:ff:fe7e:3466
    Backup Designated Router (ID) 10.12.49.129
      Interface Address fe80::5054:ff:fe4e:32d1
    Timer interval configured, Hello 10, Dead 40, Wait 40, Retransmit 5
      Hello due in 00:00:04
    Neighbor Count is 1, Adjacent neighbor count is 1
```

Originate Type-7 LSAs and Translate to Type-5

Figure 4-46 shows the configuration to originate Type-7 LSAs and translate them into Type-5 LSAs. R3 is an NSSAASBR that originates Type-7 LSAs into the NSSA which are converted to Type-5 LSAs by R2 which is an NSSA-ABR. R1 is a backbone router.

Topology

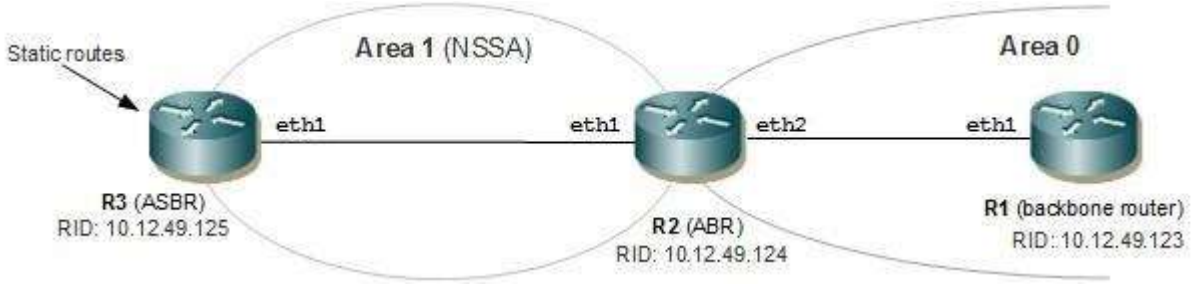

Figure 4-46: Originate Type-7 LSAs and Translate to Type-5 under Address Family IPv4

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100ABC`) which uniquely identifies the routing process
`(config-router)#router-id 10.12.49.123`	Configure the router ID to use on this tag
`(config-router)#address-family ipv4 unicast`	Enable the IPv4 address family
`(config-router-af)#exit-address-family`	Exit Router AF configuration mode
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100ABC`) which uniquely identifies the routing process.
`(config-router)#ip route 15.15.15.0/24 null`	Configure the static route with the nexthop address set to null
`(config-router)#router-id 10.12.49.124`	Configure the router ID to use for this process
`(config-router)#area 1 nssa`	Configure the area 1 as NSSA.
`(config-router)#address-family ipv4 unicast`	Enable the ipv4 address family
`(config-router-af)#exit-address-family`	Exit Router AF configuration mode
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.

(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 65	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.
(config-if)#exit	Exit interface mode

R3

#configure terminal	Enter configure mode.
(config)#router ipv6 ospf 100-ABC	Configure the routing process and specify the tag (100ABC) which uniquely identifies the routing process.
(config-router)#router-id 10.12.49.125	Configure the router ID to use for this process
(config-router)#area 1 nssa	Configure the area 1 as NSSA.
(config-router)#address-family ipv4 unicast	Enable the ipv4 address family
(config-router-af)#redistribute static	Redistribute the static routes configured into the OSPF NSSA
(config-router-af)#exit-address-family	Exit Router AF configuration mode
(config-router)#exit	Exit OSPF router mode
(config)#interface eth1	Enter interface mode
(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 65	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.

Validation 1

Verify that adjacency has been established with the configured instance identifier.

```
DUT#sh ipv6 ospf neighbor
OSPFv3 Process (1)
Neighbor ID      Pri   State           Dead Time   Interface   Instance ID
10.12.49.123       1   Full/DR         00:00:31       eth1            95
10.12.49.124       1   Full/Backup     00:00:38    eth2           94
```

Validation 2

Verify that the ABR has External LSA Type 5 in its Database.

Note: Check that R3 has generated a Type 7 LSA.

```
R3#sh ipv6 ospf database external

Summarize Intra-Area and External Routes

Figure 4-47 shows the configuration to enable intra-area and external route summarization. The IPv4 address family is enabled on R1. R2 summarizes the internal OSPF routes which R3 redistributes.

Topology

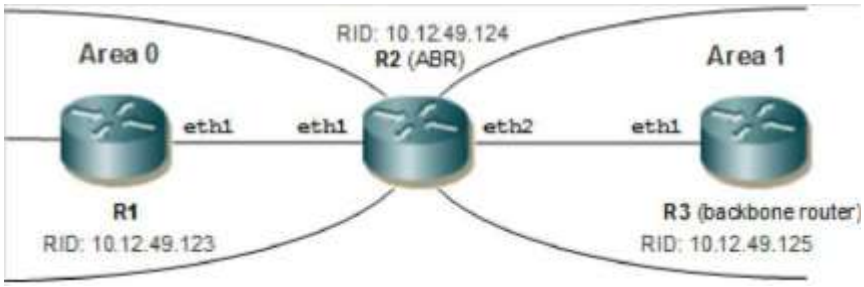

Figure 4-47: Enabling Intra-Area and External Route Summarization

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100ABC`) which uniquely identifies the routing process
`(config-router)#router-id 10.12.49.123`	Configure the router ID to use for this process.
`(config-router)#address-family ipv4 unicast`	Enable the IPv4 address family
`(config-router-af)#exit-address-family`	Exit Router AF configuration mode
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100ABC`) which uniquely identifies the routing process
`(config-router)#router-id 10.12.49.124`	Configure the router ID to use for this process
`(config-router)#address-family ipv4 unicast`	Enable the IPv4 address family

(config-router-af)#exit-address-family	Exit Router AF configuration mode
(config-router)#exit	Exit OSPF router mode
(config)#interface eth1	Enter interface mode
(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.
(config)#interface eth2	Enter interface mode
(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 65	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.
(config)#interface lo	Enter interface mode
(config-if)#ipv6 router ospf area 1 tag 101 instance-id 65	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.
(config-router-af)#area 1 range 11.11.11.11/29 advertise	Summarize the internal OSPF routes.
(config-if)#exit	Exit interface mode

R3

#configure terminal	Enter configure mode.
(config)#router ipv6 ospf 100-ABC	Configure the routing process and specify the tag (100ABC) which uniquely identifies the routing process.
(config-router)#router-id 10.12.49.125	Configure the router ID to use for this process.
(config-router)#address-family ipv4 unicast	Enable the IPv4 address family
(config-router-af)#exit-address-family	Exit Router AF configuration mode
(config-router)#exit	Exit OSPF router mode
(config)#interface eth1	Enter interface mode
(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 65	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.
(config-router)#address-family ipv4 unicast	Enable the IPv4 address family
(config-router-af)#redistribute connected	Redistribute the connected route to generate external LSAs
(config-router-af)#summary address 51.51.51.51/29	Summarize the external route at the ASBR.

Inter Area Route Aggregation Validation

Validation 1: Verify that adjacency has been established with the configured instance identifier.

```
DUT#sh ipv6 ospf neighbor
OSPFv3 Process (1)
Neighbor ID     Pri   State           Dead Time   Interface Instance ID
10.12.49.123      1   Full/DR         00:00:34    eth1       95
```

```
10.12.49.124      1   Full/DR         00:00:36    eth2       94
```

Validation 2: Verify that a single aggregated OSPF IA route is available in FIB of R1.

```
R1#sh ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default

Gateway of last resort is 10.12.49.1 to network 0.0.0.0

K*      0.0.0.0/0 via 10.12.49.1, eth0
C       10.12.49.0/24 is directly connected, eth0
C11.11.11.0/24 is directly connected, eth1
C11.13.11.0/24 is directly connected, eth3
C11.14.11.0/24 is directly connected, eth4
C11.15.11.0/24 is directly connected, eth5
C12.12.12.0/24 is directly connected, eth1
O IA    33.33.33.0/29 [110/2] via 12.12.12.12, eth1
C       127.0.0.0/8 is directly connected, lo
K       169.254.0.0/16 is directly connected, eth0
```

Validation 3: Verify that the Inter-Area-Prefix-LSA has one prefix in the R1 Link State Database.

```
R1#sh ipv6 ospf database

            OSPFv3 Router with ID (10.12.49.123) (Process 1)

Distribute List

To filter the routes that Open Shortest Path First Version 3 (OSPFv3) installs in the Routing Information Base (RIB), use the `distribute-list in` command in an appropriate configuration mode.

To filter the routes redistributed into Open Shortest Path First Version 3 (OSPFv3) from other routing protocols, use the `distribute-list out` command in an appropriate configuration mode.

Topology

Figure 4-48 shows the configuration to illustrate the distribute-list support for OSPFv3

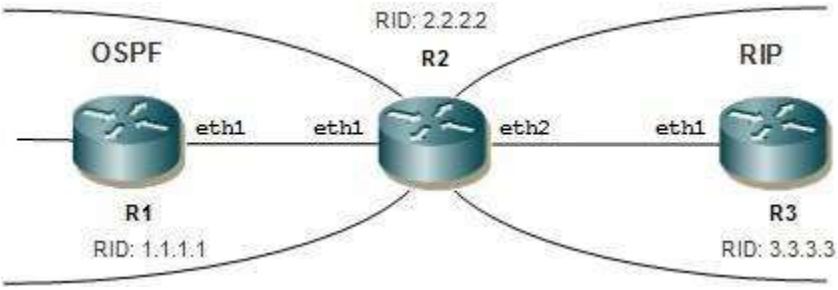

Figure 4-48: Basic Topology for Distribute-list

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 address 2000::1/64`	Configure the IPv6 address of the interface.
`(config-if)#ipv6 router ospf area 0 tag proc1`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf proc1`	Configure the routing process
`(config-router)#router-id 1.1.1.1`	Configure router-id to uniquely identify the router
`(config-router)#end`	Exit router mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 address 2000::50/64`	Configure the IPv6 address of the interface.
`(config-if)#ipv6 router ospf area 0 tag proc1`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process
`(config-if)#exit`	Exit interface mode.

(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 address 4000::50/64	Configure the IPv6 address of the interface.
(config-if)#ipv6 router ospf area 0 tag proc1	Configure the interface in an area assigned with the area ID
(config-if)#ipv6 router rip	Configure rip instance under interface
(config-if)#exit	Exit interface mode.
(config)#router ipv6 rip	Configure the rip routing process
(config-router)#neighbor fe80::5054:ff:fe85:19bc eth1	Configure RIP neighbor peer
(config-router)#exit	Exit router mode.
(config)#ipv6 access-list 1 permit 7777::/64	Configure access list to permit 7777::/64 and deny 8888::/64
(config)#router ipv6 ospf proc1	Configure the routing process
(config-router)#router-id 2.2.2.2	Configure router-id to uniquely identify the router
(config-router)#redistribute rip	Redistribute rip routes
(config-router)#distribute-list 1 out rip	Configure distribute list to allow the permitted routes
(config-router)#exit	Exit router mode.
(Config)#ipv6 access-list 1 permit 8888::/64	Configure static route
(config-router)#exit	Exit router mode.

R3

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 address 4000::51/64	Configure the IPv6 address of the interface.
(config-if)#ipv6 router rip	Configure rip instance under interface
(config-if)#exit	Exit interface mode.
(config)#router ipv6 rip	Configure the rip routing process
(config-router)#neighbor fe80::5054:ff:fec6:69f eth2	Configure rip neighbor peer
(config-router)#end	Exit router mode.
(config)#ipv6 route 7777::/64 eth2	Configure static route
(config)#ipv6 route 8888::/64 eth3	Configure static route
(config)#router ipv6 rip	Configure the rip routing process

(config-router)#redistribute static	Redistribute configured static routes
(config-router)#end	Exit router mode.

Validation 1

Verify OSPF neighborship is up between R1and R2

R2

```
R2#show ipv6 ospf neighbor
OSPFv3 Process (Proc1)
          Neighbor ID    Pri    State           Dead Time   Interface  Instance ID
 1.1.1.1           1   Full/Backup      00:00:38    eth1        0
```

Validation 2

Check if permitted route 7777::/64 is present in route table and denied route 8888::/64 is not present.

R1

```
R1#show ipv6 ospf route
OSPFv3 Process (Proc1)
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1  - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1  - OSPF external type 1, E2 - OSPF external type 2
   Destination      Metric          Next-hop
C  2000::/64          1            directly connected, eth1, Area 0.0.0.0
E2 7777::/64         1/20   via    fe80::5054:ff:fe1e:269d, eth1
```

Validation 3

Check both the routes 7777::/64 and 8888::/64 are present after 8888::/64 is permitted

R1

```
rtr1#show ipv6 ospf route
OSPFv3 Process (Proc1)
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2

   Destination    Metric     Next-hop
C  2000::/64         1     directly connected, eth1, Area 0.0.0.0
E2 7777::/64       1/20    via fe80::5054:ff:fe1e:269d, eth1
E2 8888::/64       1/20    via fe80::5054:ff:fe1e:269d, eth1
```

Loop Free Alternate

The diagram shows the configuration for the OSPFv3 Loop Free Alternate (LFA) feature.

Topology

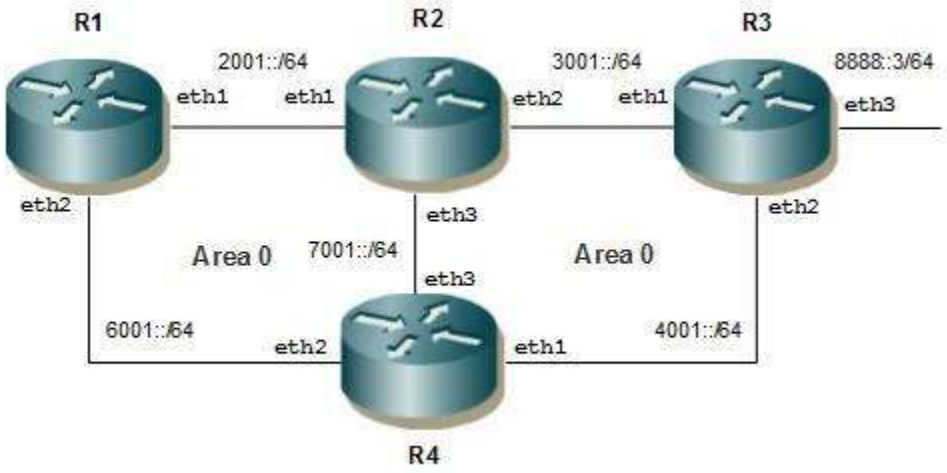

Figure 4-49: Basic OSPFv3 LFA Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 address 2001::1/64`	Configure the IPv6 address of the interface.
`(config-if)#ipv6 router ospf area 0 tag 1`	Enable OSPFv3 on the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 address 6001::1/64`	Configure the IPv6address of the interface.
`(config-if)#ipv6 router ospf area 0 tag 1`	Enable OSPFv3 on the interface.
`(config-if)#ipv6 ospf cost 5`	Configure cost for the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 1`	Configure the routing process and specify the Process ID (`1`).
`(config)#router-id 1.1.1.1`	Configure the router-id
`(config-router)#fast-reroute keep-allpaths`	Configure LFA-FRR to calculate the available backup path.
`(config-router)#end`	Exit router mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 address 2001::2/64`	Configure the IPv6 address of the interface.

(config-if)#ipv6 router ospf area 0 tag 1	Enable OSPFv3 on the interface.
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 address 3001::2/64	Configure the IPv6 address of the interface.
(config-if)#ipv6 router ospf area 0 tag 1	Enable OSPFv3 on the interface.
(config-if)#exit	Exit interface mode.
(config)#interface eth3	Enter interface mode.
(config-if)#ipv6 address 7001::2/64	Configure the IP v6address of the interface.
(config-if)#ipv6 router ospf area 0 tag 1	Enable OSPFv3 on the interface.
(config-if)#ipv6 ospf cost 2	Configure cost for the interface.
(config)#router ipv6 ospf 1	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config)#router-id 2.2.2.2	Configure the router-id
(config-router)#end	Exit router mode.

R3

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 address 3001::3/64	Configure the IPv6 address of the interface.
(config-if)#ipv6 router ospf area 0 tag 1	Enable OSPFv3 on the interface.
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 address 4001::3/64	Configure the IP v6address of the interface.
(config-if)#ipv6 router ospf area 0 tag 1	Enable OSPFv3 on the interface.
(config-if)#ipv6 ospf cost 2	Configure cost for the interface.
(config)#interface eth3	Enter interface mode.
(config-if)#ipv6 address 8888::3/64	Configure the IP v6address of the interface.
(config-if)#ipv6 router ospf area 0 tag 1	Enable OSPFv3 on the interface.
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 1	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config)#router-id 3.3.3.3	Configure the router-id
(config-router)#end	Exit router mode.

R4

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 address 5001::4/64`	Configure the IPv6 address of the interface.
`(config-if)#ipv6 router ospf area 0 tag 1`	Enable OSPFv3 on the interface.
`(config-if)#ipv6 ospf cost 2`	Configure cost for the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 address 6001::4/64`	Configure the IPv6 address of the interface.
`(config-if)#ipv6 router ospf area 0 tag 1`	Enable OSPFv3 on the interface.
`(config-if)#ipv6 ospf cost 5`	Configure cost for the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth3`	Enter interface mode.
`(config-if)#ipv6 address 7001::4/64`	Configure the IPv6 address of the interface.
`(config-if)#ipv6 router ospf area 0 tag 1`	Enable OSPFv3 on the interface.
`(config-if)#ipv6 ospf cost 2`	Configure cost for the interface.
`(config)#router ipv6 ospf 1`	Configure the routing process, and specify the Process ID (`1`). The Process ID should be a unique positive integer identifying the routing process.
`(config)#router-id 4.4.4.4`	Configure the router-id.
`(config-router)#end`	Exit router mode.

Validation

Check OSPFv3 neighborship. `rtr1#show ipv6 ospf neighbor`

```
OSPFv3 Process (1)
Neighbor ID      Pri   State           Dead Time   Interface  Instance ID
2.2.2.2            1   Full/DR         00:00:35    eth1       0
4.4.4.4            1   Full/DR         00:00:35    eth2       0
```

Check the OSPF route installation and LFA-FRR backup path for the primary path.

```
rtr1#show ipv6 route IPv6 Routing Table
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
       IA - OSPF inter area, E1 - OSPF external type 1,

O7001::/64 [110/7] via fe80::5054:ff:fe7b:921e, eth2 inactive, 00:00:59
O8888::/64 [110/8] via fe80::5054:ff:fe7b:921e, eth2 inactive, 00:00:09
```

Not mandatory that for all primary path, there exists an LFA backup path only if inequality equation satisfies according to attributes configured on routers, backup path will be calculated.

To prohibit an interface from being used as a repair path, disable fast reroute calculation on the interface.

```
(config)#interface eth2
(config-if)#ipv6 ospf fast-reroute per-prefix candidate disable (config-if)#end
```

Verify that the `eth2` interface is not used for backup path calculation.

```
rtr1#show ipv6 route IPv6 Routing Table
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
       IA - OSPF inter area, E1 - OSPF external type 1,
       E2 - OSPF external type 2, N1 - OSPF NSSA external type 1,
       N2 - OSPF NSSA external type 2, I - IS-IS, B - BGP Timers:
Uptime

O8888::/64 [110/3] via fe80::5054:ff:feed:dc42, eth1, 00:00:34
Cfe80::/64 via ::, eth2, 17:48:03 rtr1#show ipv6
route fast-reroute
```

Now there is no LFA backup paths as we have disabled the interface from backup path calculation

Tie-Breaking Configuration:

By default, LFA backup path is calculated based on interface-disjoint. Other supported attributes are:

- Primary Path
- Broadcast-link protecting
- Node-protection

```
(config)#router ipv6 ospf 1
```

```
rtr1(config-router)#fast-reroute tie-break node-protecting index 1
```

Verify `show ipv6 route` and `show ipv6 route fast-reroute` for backup path calculated according to attributes configured above.

```
rtr1#show ipv6 route IPv6

CHAPTER 5 IS-IS IPv4

This chapter contains basic IS-IS (Intermediate System to Intermediate System) configuration examples.

Enable IS-IS on an Interface

This example shows the minimum configuration required for enabling IS-IS on an interface. R1 and R2 are two routers in the `ABC` instance connecting to the network 10.10.10.0/24. After enabling IS-IS on an interface, create a routing instance, and specify the Network Entity Title (NET). IS-IS explicitly specifies a NET to begin routing. NET is comprised of the area address and the system ID of the router.

Topology

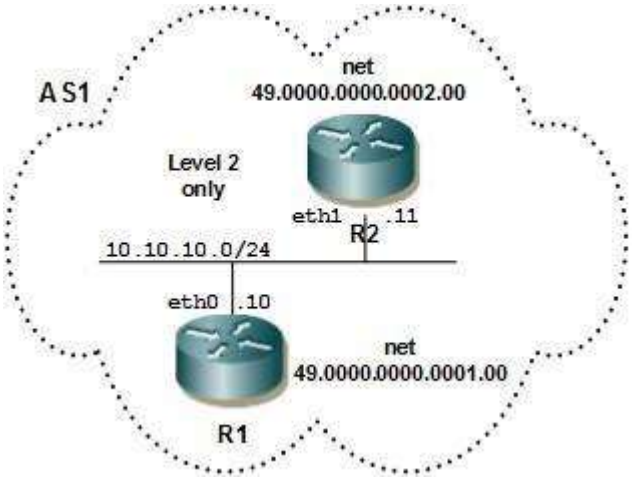

Figure 5-50: Basic IS-IS Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC)`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (`ABC`).
`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#net 49.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

`#configure terminal`	Enter configure mode.

`(config)#interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC)`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area `49 (ABC)`.
`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#net 49.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

Validation

```
#sh clns  neighbors
Tag 1:  VRF : default
System Id       Interface  SNPA                State  Holdtime  Type Protocol
0001.0000.0002 eth1        0800.2718.1dc2      Up      24        L1   IS-IS
                                               Up      24        L2   IS-IS
#sh ip isis route
Codes: C - connected, E - external, L1 - IS-IS level-1, L2 - IS-IS level-2
ia - IS-IS inter area, D - discard, e - external metric
Tag 1:  VRF : default
    Destination     Metric      Next-Hop            Interface      Tag
L1   1.1.1.0/24      20          2.2.2.1              eth1          0
C    2.2.2.0/24      10          -                    eth1          0
```

Set Priority

This example describes how to set the priority for an interface. Set a high priority for a router to make it the Designated IS (DIS). Router R3 is configured to have a priority of 70, this is higher than the default priority (64) of R1 and R2. This makes R3 the DIS.

Topology

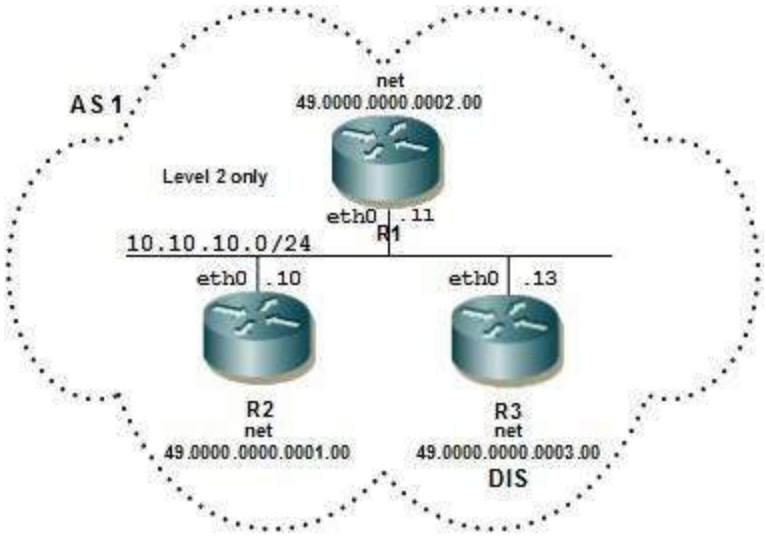

Figure 5-51: Set IS-IS Priority

Configuration

R3

#configure terminal	Enter configure mode.
(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#isis priority 70	Specify the router priority to a higher priority (70) to make R3 the designated IS (DIS).
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R1

(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

Validation

Redistribute Routes into IS-IS

In this example, the configuration causes BGP routes to be imported into the IS-IS routing table, and advertised into the `ABC` instance.

Topology

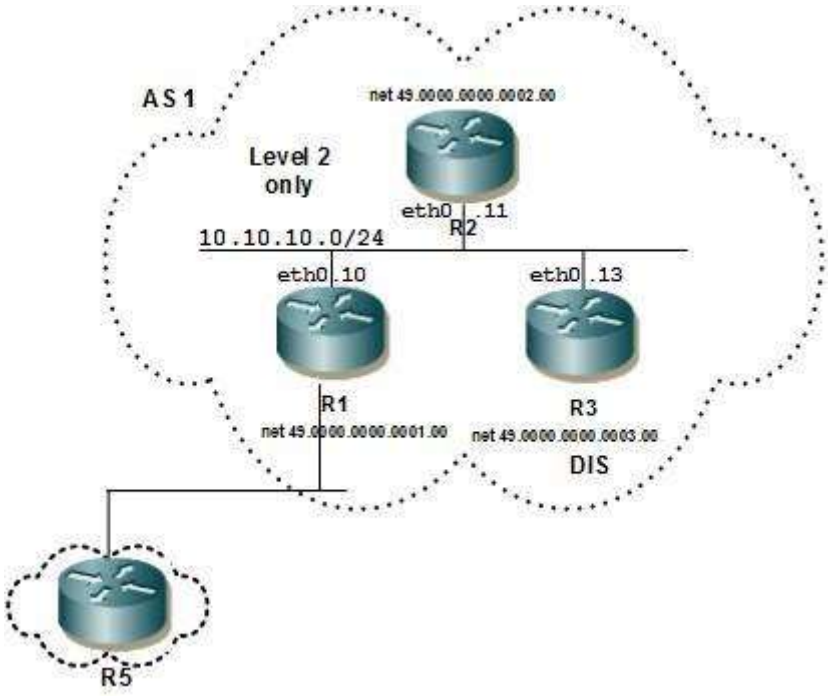

Figure 5-52: Redistribute Routes Into IS-IS

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC)`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area `49` (`ABC`).
`(config-router)#is-type level-2-only`	Set the IS level for this area as `level-2-only`.
`(config-router)#net 49.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#redistribute bgp`	Specify redistributing routes from other routing protocol (BGP) into IS-IS.

Validation

show clns neighbors, show isis database, show isis topology, show ip isis route, show ip route

Metric

You can make a route the preferred route by changing its metric. In this example, the cost has been configured to make R3 the next hop for R1.

The default metric for each interface is 10. Interface eth2 on R2 has a metric of 20, and Interface eth2 on R3 has a metric of 30. The total cost to reach 10.10.14.0/24 (R4) through R2 and R3 is computed as follows:

R2: 10+20 = 30

R3: 10+30 = 40

In this topology, R1 chooses R2 as its next hop for destination 10.10.14.0/24.

Topology

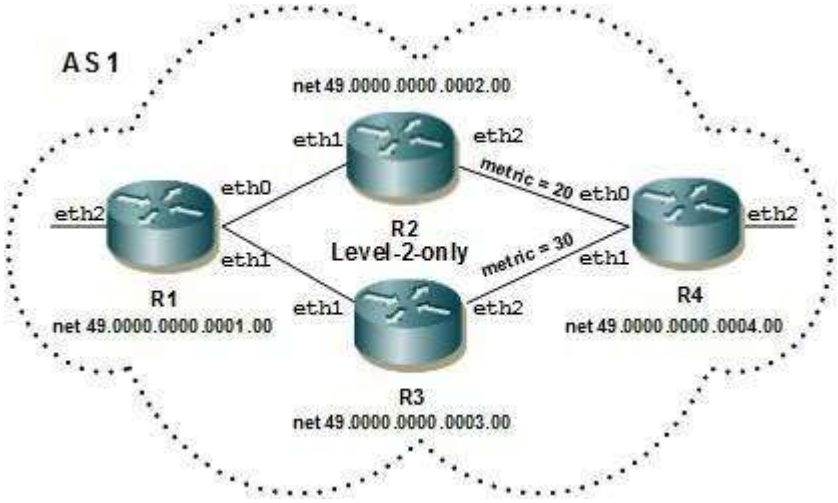

Figure 5-53: Configure IS-IS Metric

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC).`
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC).`
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.

(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#isis metric 20	Set the value of IS-IS metric (on eth2) to 20.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R3

(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Specify the interface (eth2) to configure, and enter Interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#isis metric 30	Set the value of IS-IS metric (on eth2) to 30.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R4

(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.

(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0004.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

L1-L2 Area Routing with a Single Instance

IS-IS supports a two-level hierarchy for handling and scaling the functionality of large networks. The Level-1 (L1) area is mainly for Leaf networks, and the Level-2 (L2) area is the backbone area connecting Level-1 areas. In this example, R3 and R4 are configured as Level-1 routers, and reside in the Level-1 area. R1 and R2 are configured as Level-1-2 routers, and connect these two Level-1 areas with a backbone Level-2 area. You can configure Level-1-2 routers with single or multiple instances: This configuration shows the single-instance version of the Level-1-2 router.

Topology

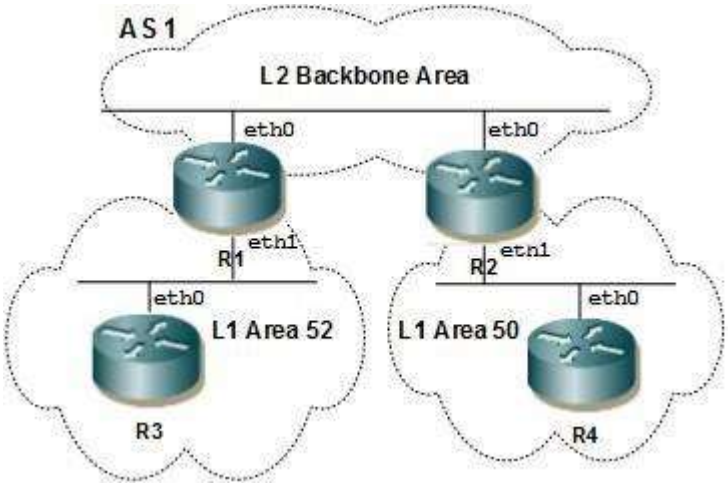

Figure 5-54: Single-Instance L1-L2 Area Routing

Configuration

R1

#configure terminal	Enter configure mode.

(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on the interface eth0 for area ABC.
(config-if)#isis circuit-type level-2-only	Set the circuit type for the interface eth0.
(config-if)#exit	Exit interface mode.
#configure terminal	Enter configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on the interface eth1 for area ABC.
(config-if)#isis circuit-type level-1	Set the circuit type for interface eth1 to level 1.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area ABC.
(config-router)#net 52.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)#ip router isis bb	Enable IS-IS routing on the interface eth0 for area bb.
(config-if)#isis circuit-type level-2-only	Set the circuit type for the interface eth0 to level-2 only.
(config-if)#exit	Exit interface mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip router isis bb	Enable IS-IS routing on interface eth1 for area bb.
(config-if)#isis circuit-type level-1	Set the circuit type for interface eth1 to level 1.
(config-if)#exit	Exit interface mode.
(config)#router isis bb	Create an IS-IS routing instance for area bb.
(config-router)#net 50.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R3

(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)#ip router isis xyz	Enable IS-IS routing on the interface eth0 for area xyz.
(config-if)#exit	Exit interface mode.
(config)#router isis xyz	Create an IS-IS routing instance for area xyz.
(config-router)#is-type level-1	Set the IS level for this area (xyz) as level-1.
(config-router)#net 52.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R4

(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.

(config-if)#ip router isis aa	Enable IS-IS routing on the interface eth0 for area aa.
(config-if)#exit	Exit interface mode.
(config)#router isis aa	Create an IS-IS routing instance for area aa.
(config-router)#is-type level-1	Set the IS level for this area (aa) as level-1.
(config-router)#net 50.0000.0000.0004.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

Validation

L1-L2 Area Routing with Multiple Instances

IS-IS supports a two-level hierarchy for handling and scaling the functionality of large networks. The Level-1 (L1) area is mainly for Leaf networks, and the Level-2 (L2) area is the backbone area connecting Level-1 areas. In this example, R3 and R4 are configured as Level-1 routers, and reside in the Level-1 area. R1 and R2 are configured as Level-1-2 routers, and connect these two Level-1 areas with a backbone Level-2 area. You can configure Level-1-2 routers with single or multiple instances: This configuration shows the multiple-instance version of the Level-1-2 router.

Topology

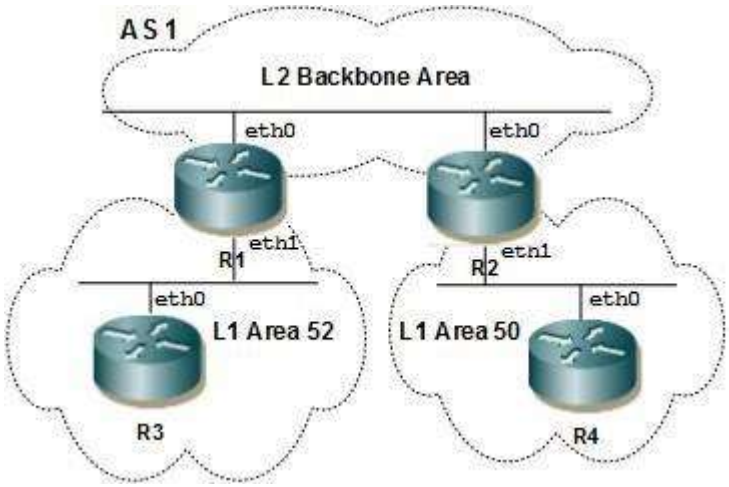

Figure 5-55: Multiple-Instance L1-L2 Area Routing

Configuration

R1

#configure terminal	Enter configure mode.
(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)#ip router isis aaa	Enable IS-IS routing on interface eth0 for area aaa.

(config-if)#exit	Exit interface mode.
(config)#router isis aaa	Create an IS-IS routing instance for area aaa.
(config-router)#is-type level-2-only	Set the IS level for this area (aaa) as level-2-only.
#configure terminal	Enter configure mode.
(config-router)#net bb.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip router isis ccc	Enable IS-IS routing on interface eth1 for area ccc.
(config-if)#exit	Exit interface mode.
(config)#router isis ccc	Create an IS-IS routing instance for area ccc.
(config-router)#is-type level-1	Set the IS level for this area (ccc) as level-1.
(config-router)#net cc.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
R2	
(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)#ip router isis bb	Enable IS-IS routing on interface eth0 for area bb.
(config-if)#exit	Exit interface mode.
(config)#router isis bb	Create an IS-IS routing instance for area bb.
(config-router)#is-type level-2-only	Set the IS level for this area (bb) as level-2-only.
(config-router)#net bb.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on interface eth1 for area ABC.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area ABC.
(config-router)#is-type level-1	Set the IS level for this area (ABC) as level-1.
(config-router)#net cc.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
R3	
(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)#ip router isis xyz	Enable IS-IS routing on interface eth0 for area xyz.
(config-if)#exit	Exit interface mode.
(config)#router isis xyz	Create an IS-IS routing instance for area xyz.

(config-router)#is-type level-1	Set the IS level for this area (xyz) as level-1.
(config-router)#net 52.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R4

(config)#interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)#ip router isis aa	Enable IS-IS routing on interface eth0 for area aa.
(config-if)#exit	Exit interface mode.
(config)#router isis aa	Create an IS-IS routing instance for area aa.
(config-router)#is-type level-1	Set the IS level for this area (aa) as level-1.
(config-router)#net 52.0000.0000.0004.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

Route Leaking

Route leaking is defined in RFC 2966. For Level-1 (L1) routers, only level-1 routes are populated in the routing table. The L1 router has a default route to the nearest Level-1/Level-2 (L1/L2) router: This could result in sub-optimal routing in certain scenarios. Route leaking causes an L1/L2 router to advertise the level-2 routes in its database to the L1 router, thus allowing the L1 router to acknowledge the prefixes advertised by the Level-2 (L2) router. In this way, the L1 router has the ability to learn the true cost to reach other areas.

In the following example, R1 is the L1 router, R2 is the L1/L2 router doing the route leaking, and R3 is the L2 router. The following configuration is given only for R2, assuming that the adjacency with R1 and R3 are already up, and the route tables with appropriate routes are already populated.

Topology

Figure 5-56: Route Leaking Topology

Configuration

R2

`#configure terminal`	Enter configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area `49 (1)`.
`(config-router)#redistribute isis level-2 into level-1`	Redistribute routes learned from level 2 into level 1 (route leaking).
`(config-router)#end`	Exit Router mode.

In the example, route, `i ia 3.3.3.0/24 [115/30] via 15.1.1.32, eth2, 00:00:02`, is the L2 route leaked by the L1/L2 router into the L1 router.

```
Router1#show ip route

Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area

C15.1.1.0/24 is directly connected, eth2
C31.31.31.31/32 is directly connected, lo
C127.0.0.0/8 is directly connected, lo
K169.254.0.0/16 is directly connected, eth0
```

Validation

show ip route, show isis database, show ip isis route

Route Summarization

Route summarization makes the routing table smaller, but still allows complete IP connectivity, if everything is configured properly.

The following example consists of a three-router topology, in which R2 is doing the summarization. In this example, R1 is the L1 router, R2 is the L1/L2 router doing the summarization, and R3 is the L2 router. The following configuration is given only for R2, assuming that the adjacencies with R1 and R3 are already up, and the route tables with the appropriate routes are already populated.

Topology

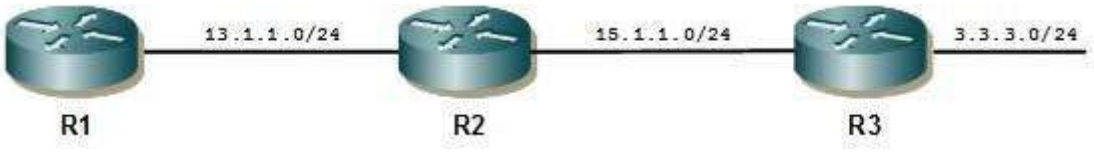

Figure 5-57: Route Summarization Topology

Configuration

R2

`#configure terminal`	Enter configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area `49 (1)`.
`(config-router)#summary-address 20.0.0.0/6 level-1 metric 1`	The prefixes, 20.10.3.0/8, 21.10.3.0/8, 22.10.3.0/8, and 23.10.3.0/8 are summarized to 20.0.0.0/6.
`(config-router)#end`	Exit Router mode.

Validation

show ip route

Graceful Restart

ISIS provides graceful restart, in which the adjacency and routes are maintained in the routing table for the grace period. In this way, the data flow is not affected, and there is no packet loss during the restart phase.

In the following example, R1 is the L1/L2 router, and R2 is the L1/L2 restart-helper router. The following configuration is given only for R2, assuming that the adjacency with R1 is already up, and the route tables with the appropriate routes are already populated.

Topology

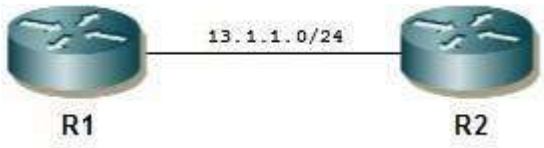

Figure 5-58: IS-IS Graceful Restart

Configuration

R2

`#configure terminal`	Enter configure mode.
`(config)#isis restart helper`	Configure this router as a restart helper.
`(config)#isis restart grace-period 100`	Set the grace period to 100 seconds. The restarting router should come up before 100 seconds, otherwise, the adjacency and routes will be deleted.

Note: The IS-IS daemon in the restarting router must be manually restarted: it does not restart automatically.

Validation

show ip route, show clns neighbors, show ip route database

IS-IS Distance

Administrative distance in IS-IS can be configured for a specified source ID or for all routes.

This example shows configuring the IS-IS administrative distance for the IPv4 address family.

Topology

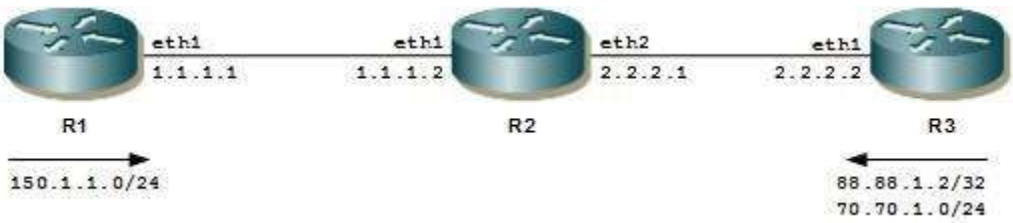

Figure 5-59: IS-IS Distance Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 1.1.1.1/24`	Assign the IP address on this interface (`eth1`).
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth1`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis 1`	Create an IS-IS routing instance (`1`).
`(config-router)#net 49.0001.0000.0001.00`	Set a Network Entity Title (NET) for this instance, specifying the address and the system ID.
`(config-router)#redistribute static`	Redistribute the static routes.

R2

`#configure terminal`	Enter configure mode.
`(config)#access-list DIST permit 88.88.1.2/32`	Create an access list to permit the `88.88.1.2/32` route from R3.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 1.1.1.2/24`	Assign the IP address on this interface (`eth1`).
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth1`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)#ip address 2.2.2.1/24`	Assign the IP address on this interface (`eth2`).
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth2`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis 1`	Create an IS-IS routing instance (`1`).
`(config-router)#net 49.0001.0000.0002.00`	Specify the NET address.
`(config-router)#distance 100`	Configure the administrative distance for all routes received from R1 and R2.

(config-router)#distance 20 0000.0000.0001	Configure the administrative distance for all routes received from R1. This command overwrites the applied distance, 100, and will apply distance 20 for all routes received from R1.
(config-router)#distance 30 0000.0000.0003 DIST	Configure the distance, 30, to the route, 88.88.1.2/32, received from R3. All other routes from R3 (for example, 70.70.1.0/24) will have the distance applied as 100. If the distance, 100, is not configured, all other routes will have a default distance of 115.

R3

#configure terminal	Enter configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip address 2.2.2.2/24	Assign the IP address on this interface (eth1).
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1.
(config-if)#exit	Exit interface mode.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#net 49.0001.0000.0003.00	Specify the NET address.
(config-router)#redistribute static	Redistribute the static routes.

Validation

Overload Bit

The expanded use of the overload bit in IS-IS is useful to Internet Service Providers (ISPs) who run both BGP and IS-IS to avoid certain black-hole scenarios. The overload bit feature allows configuration of a router to disable the overload bit automatically when BGP has converged.

IS-IS disables the overload bit if BGP is not converged in ten minutes, and the wait-for-bgp option is configured.

When the set overload-bit wait-for-bgp is configured after restart (for example, using the set-overloadbit on-startup wait-for-bgp or set-overload-bit on-startup <5-86400> commands), the IS-IS router advertises the overload bit to all its neighbors, informing them not to route traffic through this router, except for the traffic destined to directly-connected networks of this router.

Whenever an interface is configured as no set-overload-bit (using the `no set-overload-bit` command), the router does not advertise or set the overload bit on startup.

Topology

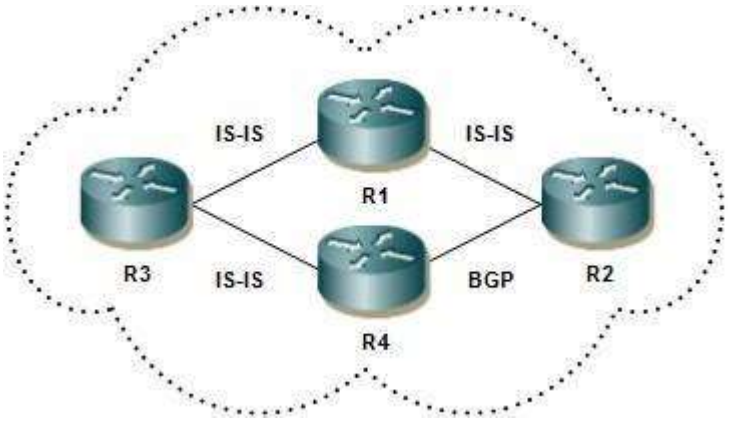

Figure 5-60: Configure Overload Bit

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (`1`).
`(config-router)#net 49.0001.0000.0000.0001.00`	Define the NET address.
`(config-router)#exit`	Exit router mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure and enter Interface mode.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth1` (connected to R2).
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure and enter Interface mode.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth2` (connected to R3).
`(config-if)#isis metric 50`	Increase the value of IS-IS metric from R1-R3.

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 100`	Create a BGP routing instance (`100`).
`(config-router)#neighbor 1.1.1.2 remote-as 2`	Specify the neighbor's IP address (`1.1.1.2`) and the ASN value of the neighbor (`2`).
`(config-router)#exit`	Exit router mode.

(config)#interface eth1	Specify the interface (eth1) to configure and enter Interface mode.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1 (connected to R1).
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface eth2	Specify the interface (eth2) to configure and enter Interface mode.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth2 (connected to R4).
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#net 49.0001.0000.0000.0002.00	Define the NET address.
(config-router)#set-overload-bit on-startup wait-for-bgp	Configure IS-IS to set the overload bit until BGP is completely converged (maximum 600 seconds) only on restart.
(config-router)#set-overload-bit on-startup wait-for-bgp suppress external	Configure IS-IS to suppress external routes until the configured value (in seconds) only on startup.
(config-router)#set-overload-bit on-startup wait-for-bgp suppress interlevel	Configure IS-IS to suppress inter-level routes until the configured value (in seconds) only on startup.

R3

#configure terminal	Enter configure mode.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#net 49.0001.0000.0000.0003.00	Define the NET address.
(config-router)#exit	Exit router mode.
(config)#interface eth1	Specify the interface (eth1) to configure and enter Interface mode.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1 (connected to R4).
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface eth2	Specify the interface (eth2) to configure and enter Interface mode.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth2 (connected to R1).

R4

#configure terminal	Enter configure mode.
(config)#router bgp 100	Create a BGP routing instance (100).
(config-router)#neighbor 1.1.1.1 remote-as 1	Specify the neighbor's IP address (1.1.1.1) and the ASN value of the neighbor (1).
#configure terminal	Enter configure mode.
(config-router)#exit	Exit router mode.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#net 49.0001.0000.0000.0004.00	Define the NET address.
(config-router)#exit	Exit router mode.

`(config)#interface eth1`	Specify the interface (`eth1`) to configure and enter Interface mode.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth1` (connected to R3).
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure and enter Interface mode.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth2` (connected to R2).

Validation

Use the following commands to verify adjacency and protocol-related details:

show clns neighbors, show isis database, show ip bgp summary

Passive Interface

In ISP and large enterprise networks, many of the distribution routers have more than 200 interfaces. Before the Default Passive-Interface feature, there were two possibilities for obtaining routing information from tall of these interfaces:

- Configure a routing protocol on the backbone interfaces and redistribute connected interfaces.
- Configure the routing protocol on all interfaces and manually set most of them as passive, which was time consuming.

The solution to this problem was to configure the routing protocol on all interfaces and manually set the `passiveinterface` command on the interfaces where adjacency was not desired. In certain networks, this meant coding 200 or more passive-interface statements. With the Default Passive Interface feature, this problem is solved by allowing all interfaces to be set as passive by default using a single `passive-interface` default command, then configuring individual interfaces in which adjacencies are desired using the `no passive-interface` command.

Usage

1. When a specific interface is configured as passive using the `passive-interface` command:
   - The interface loses its adjacency on that interface, for example, eth1.
   - The interface (eth1) is still advertised by other IS-IS speaking interfaces to their neighbors.
2. When a specific interface is configured as passive using `passive-interface` command followed by removing the configuration using `no passive-interface` command:
   - The interface is IS-IS disabled and must be enabled using the `ip router isis` command (for example, `ip router isis 1`).
   - The interface (for example, eth1) is not advertised by other IS-IS speaking interfaces to their neighbors.
3. When an interface is configured with the `passive interface` command:
   - All interfaces lose their adjacency, except the interface with the higher index number. (For example: If eth1, eth2, eth3, and eth4 are the router interfaces, eth4 has the highest index number.) • All interfaces are advertised by the active IS-IS speaking interface to its neighbors.

4. When an interface is configured with the `no passive interface` command:
   - All interfaces are IS-IS disabled, except the interface that was active, and all interfaces must enable IS-IS on these interfaces using the `ip router isis` command (for example, `ip router isis 1`).
   - All interfaces are not advertised by the active IS-IS speaking interface to its neighbors.

Topology

Figure 5-61 shows a passive-interface configuration example.

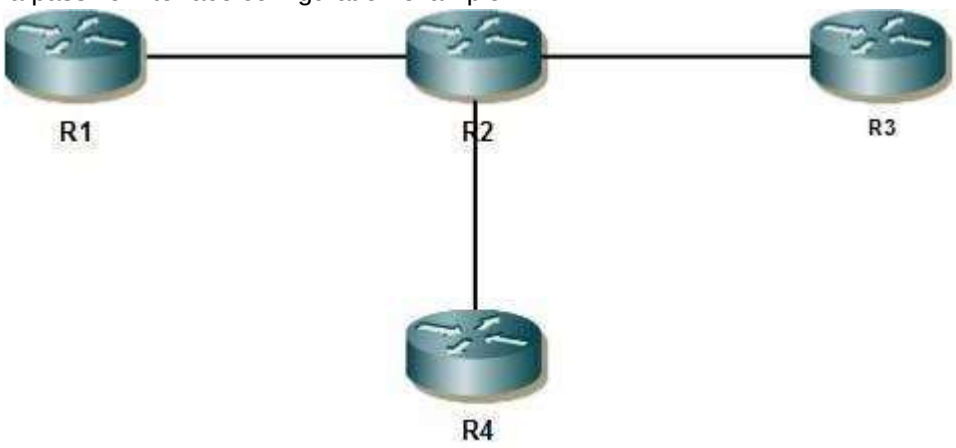

Figure 5-61: IS-IS Passive Interface

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance `(1)`.
`(config-router)#net 49.0001.0000.0000.0001.00`	Define the NET address.
`(config-router)#exit`	Exit router mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure and enter Interface mode.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth1` (connected to R2).

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure and enter Interface mode.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth1` (connected to R1).
`#configure terminal`	Enter configure mode.
`(config-if)#exit`	Exit Interface mode and return to Configure mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure and enter Interface mode.

(config-if)#ip router isis 1	Enable IS-IS routing on interface eth2 (connected to R3).
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#interface eth3	Specify the interface (eth3) to configure and enter Interface mode.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth2 (connected to R4).
(config-if)#exit	Exit Interface mode and return to Configure mode.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#net 49.0001.0000.0000.0002.00	Define the NET address.
(config-router)#passive-interface eth1	Configure the eth1 interface as passive.
(config-router)#passive-interface	Configure all interfaces as passive, except one (interface with the higher index number).

R3

#configure terminal	Enter configure mode.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#net 49.0001.0000.0000.0003.00	Define the NET address.
(config-router)#exit	Exit router mode.
(config)#interface eth1	Specify the interface (eth1) to configure and enter Interface mode.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1 (connected to R2).

R4

#configure terminal	Enter configure mode.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#net 49.0001.0000.0000.0004.00	Define the NET address.
(config-router)#exit	Exit router mode.
(config)#interface eth1	Specify the interface (eth1) to configure and enter Interface mode.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1 (connected to R2).

CHAPTER 6 IS-IS IPv6

This chapter contains basic IS-IS (IPv6) configuration examples.

For details about the commands used in these examples, see the *Intermediate System to Intermediate System Command Reference*.

Enable IS-IS on an Interface

This example shows the minimum configuration required for enabling IS-IS (IPv6) on an interface. R1 and R2 are two routers in the `Inst1` instance connecting to the network 3ffe:10::/64. After enabling IS-IS on an interface, create a routing instance, and specify the Network Entity Title (NET). IS-IS explicitly specifies a NET to begin routing. NET is comprised of the area address and the system ID of the router.

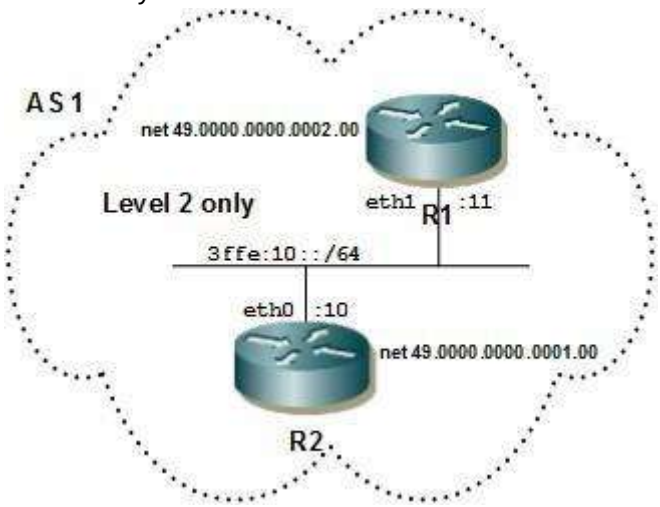

Figure 6-62: Enable IS-ISv6

R1

`# configure terminal`	Enter Configure mode.
`(config)# interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49` (`Inst1`).
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis Inst1`	Create an IS-IS routing instance for area `49` (`Inst1`).
`(config-router)# is-type level-2-only`	Configure instance `Inst1` as `level-2-only` routing.
`(config-router)# net 49.0000.0000.0001.00`	Establish a Network Entity Title for this instance, specifying the area address and system ID.

R2

`# configure terminal`	Enter Configure mode.

`(config)# interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49 (Inst1).`
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis Inst1`	Create an IS-IS routing instance for area `49 (Inst1`).
`(config-router)# is-type level-2-only`	Configure instance `Inst1` as `level-2-only` routing.
`(config-router)# net 49.0000.0000.0002.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

Validation

show clns neighbors, show isis database, show ipv6 isis topology

Set Priority

This example shows setting the priority for an interface. Set a high priority for a router to make it the Designated IS (DIS). Router R3 is configured to have a priority of 70; this is higher than the default priority (60) of R1 and R2. This makes R3 the DIS.

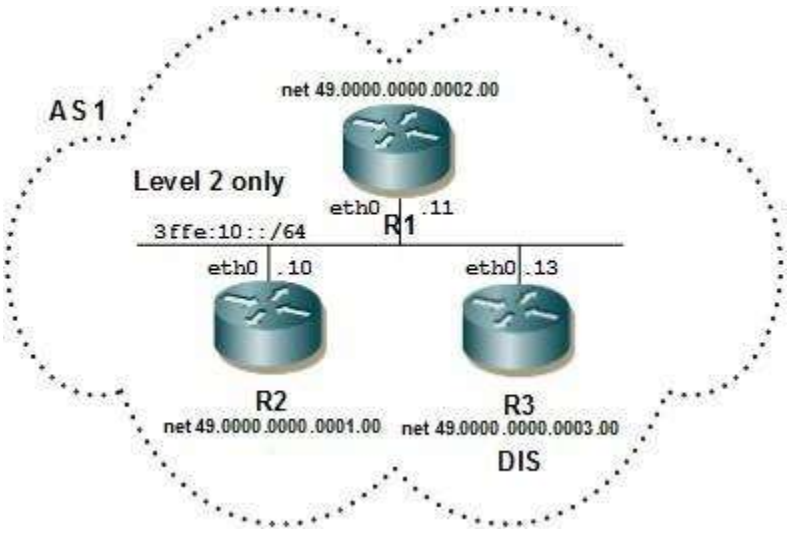

Figure 6-63: Set IS-ISv6 Priority

R3

`# configure terminal`	Enter Configure mode.
`(config)# interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49 (Inst1).`
`(config-if)# isis priority 70`	Specify the router priority to a higher priority `(70)` to make R3 the designated IS (DIS).
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.

(config)# router isis Inst1	Create an IS-IS routing instance for area 49 (Inst1).
(config-router)# is-type level-2-only	Configure instance Inst1 as level-2-only routing.
(config-router)# net 49.0000.0000.0003.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

R1

(config)# interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)# ipv6 router isis Inst1	Enable IS-IS routing on an interface for area 49 (Inst1).
(config-if)# exit	Exit Interface mode, and return to Configure mode.
(config)# router isis Inst1	Create an IS-IS routing instance for area 49 (Inst1).
(config-router)# is-type level-2-only	Configure instance Inst1 as level-2-only routing.
(config-router)# net 49.0000.0000.0000.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

R2

(config)# interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)# ipv6 router isis Inst1	Enable IS-IS routing on an interface for area 49 (Inst1).
(config-if)# exit	Exit Interface mode, and return to Configure mode.
(config)# router isis Inst1	Create an IS-IS routing instance for area 49 (Inst1).
(config-router)# is-type level-2-only	Configure instance Inst1 as level-2-only routing.
(config-router)# net 49.0000.0000.0002.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

Validation

show clns neighbors, show isis database, show ipv6 isis topology

Redistribute Routes into IS-IS

In this example, the configuration causes BGP routes to be imported into the IS-IS routing table, and advertised into the Inst1 instance.

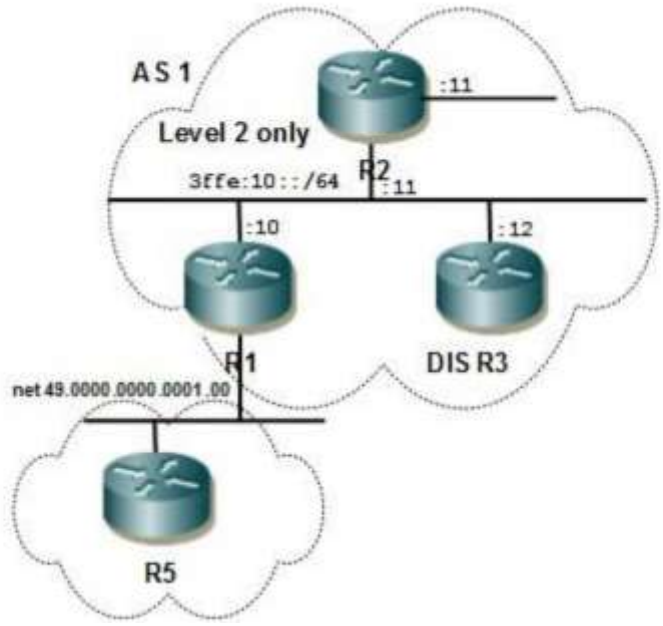

Figure 6-64: Redistribute Routes Into IS-ISv6

R1

`# configure terminal`	Enter Configure mode.
`(config)# interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49 (Inst1)`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis Inst1`	Create an IS-IS routing instance for area `49` (`Inst1`).
`(config-router)# is-type level-2-only`	Establish the IS level for this area (`Inst1`) as `level-2only`.
`(config-router)# net 49.0000.0000.0001.00`	Establish a Network Entity Title for this instance, specifying the area address and system ID.
`(config-router)# address-family ipv6`	Enter Address-Family mode.
`(config-router-af)# redistribute bgp`	Specify redistributing routes from the other routing protocol (BGP) into IS-IS.

Validation

show clns neighbors, show isis database, show ipv6 isis topology, show ipv6 isis route, show ipv6 route

Metric

Make a route the preferred route by changing its metric. In this example, cost has been configured to make R3 the next hop for R1.

The default metric on each interface is 10. Interface eth2 on R2 has a metric of 20, and Interface eth2 on R3 has a metric of 30. The total cost to reach 3ffe:10::/64 (R4) through R2 and R3:

R2: 10+20 = 30

R3: 10+30 = 40

In this topology, R1 chooses R2 as its next hop for destination 10.10.14.0/24.

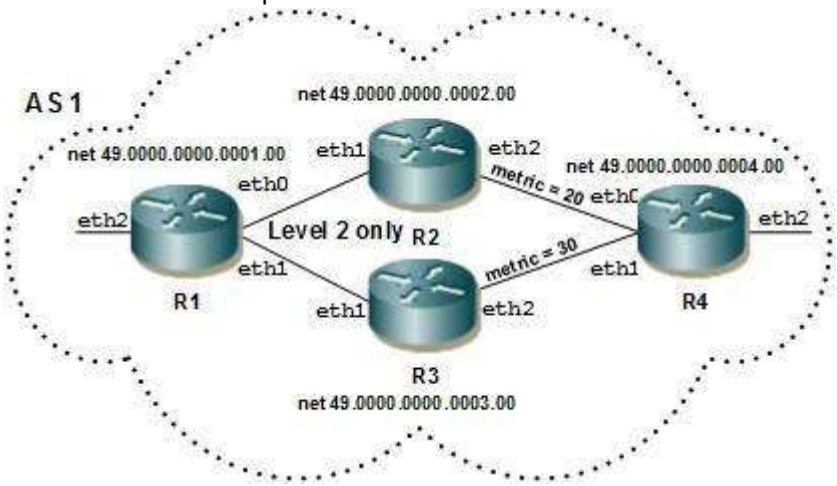

Figure 6-65: IS-ISv6 Metric

R1

`# configure terminal`	Enter Configure mode.
`(config)# interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49 (Inst1).`
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49 (Inst1).`
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49 (Inst1).`
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis Inst1`	Create an IS-IS routing instance for area `49` (`Inst1`).
`(config-router)# is-type level-2-only`	Configure instance `Inst1` as `level-2-only` routing.
`(config-router)# net 49.0000.0000.0001.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

R2

`(config)# interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49(Inst1)`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49(Inst1)`.
`(config-if)# isis metric 20`	Set the value of IS-IS metric (on `eth2`) to `20`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis Inst1`	Create an IS-IS routing instance for area `49` (`Inst1`).
`(config-router)# is-type level-2-only`	Configure instance `Inst1` as `level-2-only` routing.
`(config-router)# net 49.0000.0000.0002.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

R3

`(config)# interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49 (Inst1)`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49 (Inst1)`.
`(config-if)# isis metric 30`	Set the value of IS-IS metric (on `eth2`) to `30`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis Inst1`	Create an IS-IS routing instance for area `49` (`Inst1`).
`(config-router)# is-type level-2-only`	Configure instance `Inst1` as `level-2-only` routing.
`(config-router)# net 49.0000.0000.0003.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

R4

`(config)# interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49 (Inst1)`.

`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis Inst1`	Enable IS-IS routing on an interface for area `49 (Inst1)`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis Inst1`	Create an IS-IS routing instance for area `49 (Inst1)`.
`(config-router)# is-type level-2-only`	Configure instance `Inst1` as `level-2-only` routing.
`(config-router)# net 49.0000.0000.0004.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

Validation

show clns neighbors, show isis database, show ipv6 isis topology, show ipv6 isis route, show ipv6 route

L1-L2 Area Routing with a Single Instance

IS-IS supports a two-level hierarchy for handling and scaling the functionality of large networks. The Level-1 (L1) area is mainly for Leaf networks, and the Level-2 (L2) area is the backbone area connecting Level-1 areas. In this example, R3 and R4 are configured as Level-1 routers, and reside in the Level-1 area. R1 and R2 are configured as Level-1-2 routers, and connect these two Level-1 areas with a backbone Level-2 area. You can configure Level-1-2 routers with single or multiple instances: This configuration shows the single-instance version of the Level-1-2 router.

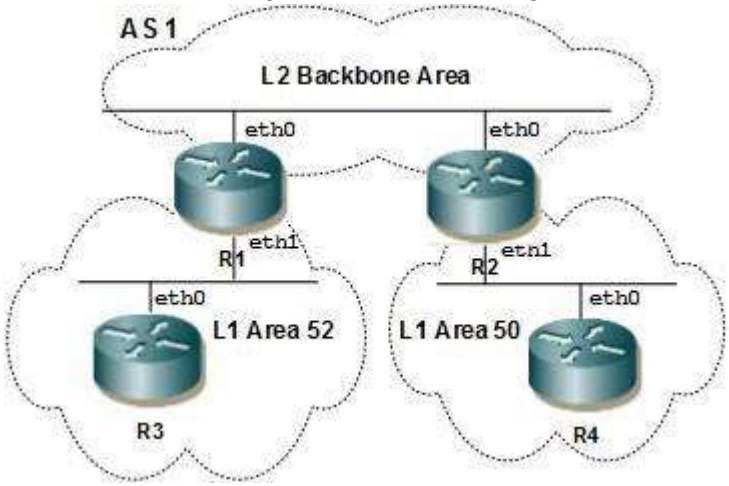

Figure 6-66: Single-Instance L1-L2 Area Routing

R1

`# configure terminal`	Enter Configure mode.
`(config)# interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.

(config-if)# ipv6 router isis abc	Enable IS-IS routing on the interface eth0 for area abc.
(config-if)# isis circuit-type level-2-only	Set the circuit type for the interface eth0.
(config-if)# exit	Exit Interface mode, and return to Configure mode.
(config)# interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)# ipv6 router isis abc	Enable IS-IS routing on the interface eth1 for area abc.
(config-if)# isis circuit-type level-1	Set the circuit type for the interface eth1.
(config-if)# exit	Exit Interface mode, and return to Configure mode.
(config)# router isis abc	Create an IS-IS routing instance for area abc.
(config-router)# net 52.0000.0000.0001.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

R2

(config)# interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)# ipv6 router isis bb	Enable IS-IS routing on the interface eth0 for area bb.
(config-if)# isis circuit-type level-2-only	Set the circuit type for the interface eth0.
(config-if)# exit	Exit Interface mode, and return to Configure mode.
(config)# interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)# ipv6 router isis bb	Enable IS-IS routing on the interface eth1 for area bb.
(config-if)# isis circuit-type level-1	Set the circuit type for the interface eth1.
(config-if)# exit	Exit Interface mode, and return to Configure mode.
(config)# router isis bb	Create an IS-IS routing instance for area bb.
(config-router)# net 50.0000.0000.0002.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

R3

(config)# interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)# ipv6 router isis xyz	Enable IS-IS routing on the interface eth0 for area xyz.
(config-if)# exit	Exit Interface mode, and return to Configure mode.
(config)# router isis xyz	Create an IS-IS routing instance for area xyz.
(config-router)# is-type level-1	Establish the IS level for this area (xyz) as level-1.
(config-router)# net 52.0000.0000.0003.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

R4

`(config)# interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis aa`	Enable IS-IS routing on the interface `eth0` for area `aa`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis aa`	Create an IS-IS routing instance for area `aa`.
`(config-router)# is-type level-1`	Establish the IS level for this area (`aa`) as `level-1`.
`(config-router)# net 50.0000.0000.0004.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

L1-L2 Area Routing with Multiple Instances

IS-IS supports a two-level hierarchy for handling and scaling the functionality of large networks. The Level-1 (L1) area is mainly for Leaf networks, and the Level-2 (L2) area is the backbone area connecting Level-1 areas. In this example, R3 and R4 are configured as Level-1 routers, and reside in the Level-1 area. R1 and R2 are configured as Level-1-2 routers, and connect these two Level-1 areas with a backbone Level-2 area. You can configure Level-1-2 routers with single or multiple instances. This configuration shows the multiple-instance version of the Level-1-2 router.

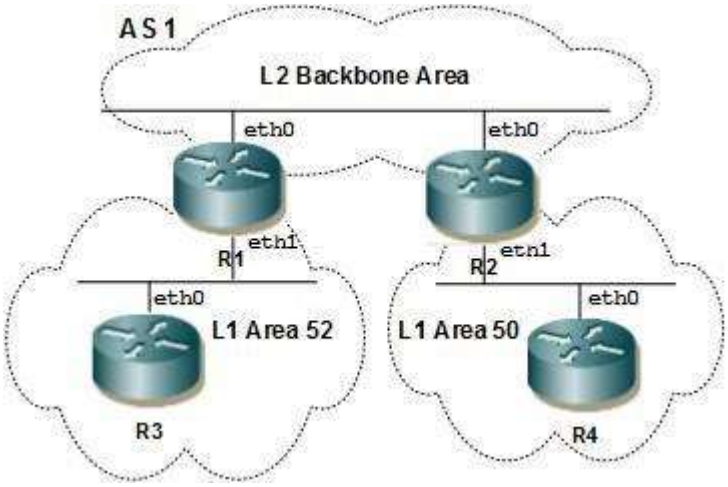

Figure 6-67: Multiple-Instance L1-L2 Area Routing

R1

`# configure terminal`	Enter Configure mode.
`(config)# interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis aaa`	Enable IS-IS routing on the interface `eth0` for area `aaa`.
`# configure terminal`	Enter Configure mode.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis aaa`	Create an IS-IS routing instance for area `aaa`.
`(config-router)# is-type level-2-only`	Establish the IS level for this area (`aaa`) as `level-2only`.

(config-router)# net bb.0000.0000.0001.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)# exit	Exit Router mode, and return to Configure mode.
(config)# interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)# ipv6 router isis ccc	Enable IS-IS routing on the interface eth1 for area ccc.
(config-if)# exit	Exit Interface mode, and return to Configure mode.
(config)# router isis ccc	Create an IS-IS routing instance for area ccc.
(config-router)# is-type level-1	Establish the IS level for this area (ccc) as level-1.
(config-router)# net 52.0000.0000.0001.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

R2

(config)# interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)# ipv6 router isis bb	Enable IS-IS routing on the interface eth0 for area bb.
(config-if)# exit	Exit Interface mode, and return to Configure mode.
(config)# router isis bb	Create an IS-IS routing instance for area bb.
(config-router)# is-type level-2-only	Establish the IS level for this area (bb) as level-2-only.
(config-router)# net bb.0000.0000.0002.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)# exit	Exit Router mode, and return to Configure mode.
(config)# interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)# ipv6 router isis abc	Enable IS-IS routing on the interface eth1 for area abc.
(config-if)# exit	Exit Interface mode, and return to Configure mode.
(config)# router isis abc	Create an IS-IS routing instance for area abc.
(config-router)# is-type level-1	Establish the IS level for this area (abc) as level-1.
(config-router)# net 52.0000.0000.0002.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

R3

(config)# interface eth0	Specify the interface (eth0) to configure, and enter Interface mode.
(config-if)# ipv6 router isis xyz	Enable IS-IS routing on the interface eth0 for area xyz.
(config-if)# exit	Exit Interface mode, and return to Configure mode.
(config)# router isis xyz	Create an IS-IS routing instance for area xyz.
(config-router)# is-type level-1	Establish the IS level for this area (xyz) as level-1.
(config-router)# net 52.0000.0000.0003.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

R4

`(config)# interface eth0`	Specify the interface (`eth0`) to configure, and enter Interface mode.
`(config-if)# ipv6 router isis aa`	Enable IS-IS routing on the interface `eth0` for area `aa`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis aa`	Create an IS-IS routing instance for area `aa`.
`(config-router)# is-type level-1`	Establish the IS level for this area (`aa`) as `level-1`.
`(config-router)# net 50.0000.0000.0004.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID.

Validation

show ipv6 isis route, show ipv6 route

Configure IS-IS IPv6 Distance

Administrative distance can be configured for an IS-IS IPv6 address family.

This example shows configuring the IS-IS administrative distance for the IPv6 address family.

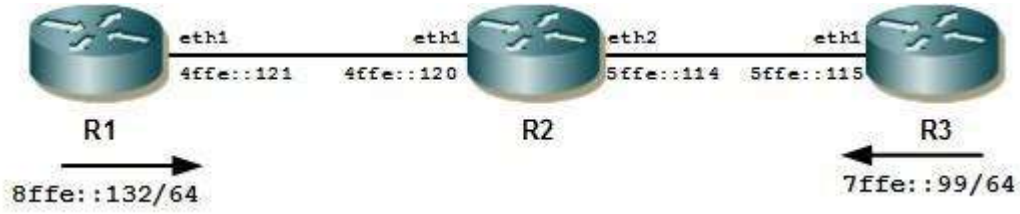

Figure 6-68: IS-ISv6 Distance

R1

`# configure terminal`	Enter Configure mode.
`(config)# interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)# ipv6 address 4ffe::121/24`	Assign the IPv6 address on this interface (`eth1`).
`(config-if)# ipv6 router isis 1`	Enable IS-ISv6 routing on interface `eth1`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis 1`	Create an IS-IS routing instance (`1`).
`(config-router)# net 49.0001.0000.0001.00`	Establish a Network Entity Title (NET) for this instance, specifying the address and the system ID.
`(config-router)# address-family ipv6`	Enter IPv6 Address-Family mode.
`(config-router-af)# redistribute static`	Redistribute the static routes.

R2

`# configure terminal`	Enter Configure mode.
`(config)# interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)# ipv6 address 4ffe::120/24`	Assign the IPv6 address on this interface (`eth1`).
`(config-if)# ipv6 router isis 1`	Enable IS-ISv6 routing on interface `eth1`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)# ipv6 address 5ffe::114/24`	Assign the IPv6 address on this interface (`eth2`).
`(config-if)# ipv6 router isis 1`	Enable IS-ISv6 routing on interface `eth2`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis 1`	Create an IS-IS routing instance (`1`).
`(config-router)# net 49.0001.0000.0002.00`	Specify the NET address.
`(config-router)# address-family ipv6`	Enter IPv6 Address-Family mode.
`(config-router)# distance 60`	Configure the administrative distance in IPv6 Address-Family mode.

R3

`# configure terminal`	Enter Configure mode.
`(config)# interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)# ipv6 address 5ffe::115/24`	Assign the IPv6 address on this interface (`eth1`).
`(config-if)# ipv6 router isis 1`	Enable IS-ISv6 routing on interface `eth1`.
`(config-if)# exit`	Exit Interface mode, and return to Configure mode.
`(config)# router isis 1`	Create an IS-IS routing instance (`1`).
`(config-router)# net 49.0001.0000.0003.00`	Specify the NET address.
`(config-router)# address-family ipv6`	Enter IPv6 Address-Family mode.
`(config-router)# redistribute static`	Redistribute the static routes.

Validation

show clns neighbors, show ipv6 route, show ipv6 route database, show ipv6 protocols isis, show ipv6 isis route

CHAPTER 7 Forwarding Plane Load Balancing

SWMRE uses Forwarding Plane Load Balancing when the kernel supports Equal Cost Multipath (ECMP). SWMRE installs the maximum number of ECMP routes supported by the kernel. This allows for load balancing to be performed with more than one nexthop to reach a destination. If the router receives and installs multiple paths with the same administrative distance and cost to a destination, load-balancing is possible.

Ideally, multiple nexthops have different interfaces to the destination, but this is not mandatory. The algorithm for distributing traffic across ECMP routes is dependent on the kernel, and typically based on the protocol, source address, destination address, and port.

Enable Load Balancing

The following example illustrates how to enable Equal Cost Multipath (ECMP), and configure a routing protocol (OSPF is used in this example) for load balancing. However, this example will not work if the kernel does not support load balancing. In this topology, R1, R2, and R3 are three Linux routers connected to each other. R1 can reach R3 through two links available to R2.

Topology

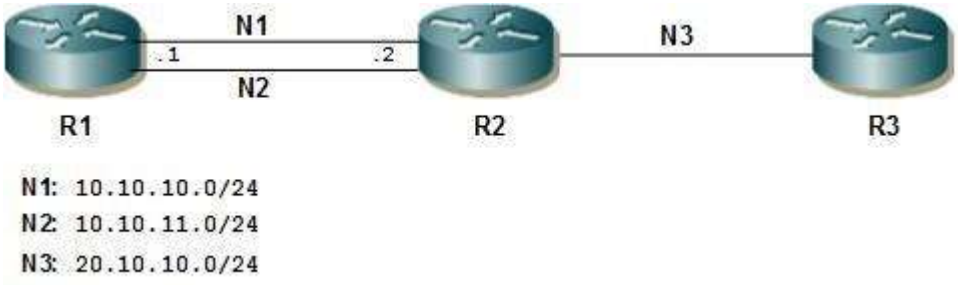

Figure 8-74: Load Balancing Topology

Configuration

R1 - NSM

1. Enable multipath support and set the maximum number of paths to be installed in the Forwarding Information Base (FIB):

```
#configure terminal
(config)#maximum-paths 2
% System Reboot is required for new Maximum-Path value to take effect.
```

Note: User can save and reboot to bring changes into effect.

R1 - OSPF

1. Configure OSPF on all interfaces on R1, R2, and R3.

   R1 learns about R3 through 2 nexthops (both networks N1 and N2).

Forwarding Plane Load Balancing

Validation

R1 - OSPF

Run the `show ip ospf route` command on R1. The OSPF routing table displays that it can reach R3 through both of the nexthops:

```
R1#show ip ospf route
    O  10.10.10.0/24 [10] is directly connected, eth1, Area 0.0.0.0 O
    10.10.11.0/24 [10] is directly connected, eth2, Area 0.0.0.0 O
    20.10.10.0/24 [20] via 10.10.10.2, eth1, Area 0.0.0.0
via 10.10.11.2, eth2, Area 0.0.0.0
```

Run the `show ip route` command on R1. It displays that R1 has installed both nexthops to reach R3 in the NSM routing table:

```
R1#show ip route
Codes: C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
      i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
* - candidate default

K       10.10.0.0/24 via 10.70.0.1, eth0
C       10.10.10.0/24 is directly connected, eth1
C10.10.11.0/24 is directly connected, eth2
C10.70.0.0/24 is directly connected, eth0
O20.10.10.0/24 [110/20] via 10.10.10.2, eth1, 00:12:40
                   [110/20] via 10.10.11.2, eth2, 00:12:40
C       127.0.0.0/8 is directly connected, lo
S       192.16.1.0/24 [1/0] is directly connected, eth1
```

CHAPTER 9 VLAN Interfaces

This chapter contains examples for configuring VLAN interfaces.

For details about the commands used in these examples, see the *Layer 2 Command Reference*.

Overview

Several Virtual LAN (VLAN) interfaces can be configured on a single Ethernet interface. Once created, a VLAN interface functions the same as any physical interface.

NSM recognizes VLAN interfaces as physical interfaces. Once VLAN interfaces are created in the kernel, and IP addresses are assigned to them, SWMRE commands can be used to configure and display VLAN interfaces the same as any physical interface. SWMRE routing protocols, such as RIP, OSPF and BGP, can run across networks using VLAN interfaces.

Two systems with physical connectivity (either directly connected or connected through a switch), can communicate with each other via VLAN interfaces that have the same VLAN IDs and belong to the same network.

If the physical interfaces are not directly connected to a switch, the corresponding ports on the switch must be configured as trunks, and should not be associated to any VLANs in the switch. The commands to configure switch ports as trunks depend on the type of the switch, and are beyond the scope of this document.

Topology

Figure 9-75 is used to describe VLAN interface configuration. In this example, there are two routers, R1 and R2, and the eth1 interface of R1 is connected directly to eth2 using an ethernet cable.

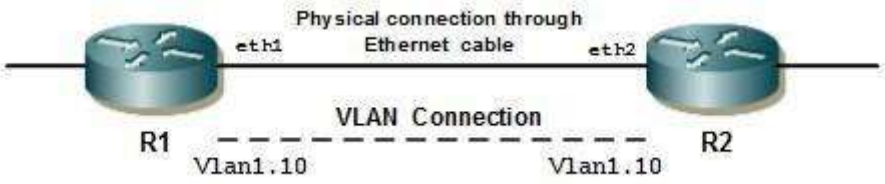

Figure 9-75: VLAN Connections

The `vlan1.10` VLAN interface is created on R1, and `vlan1.10` is created on R2. The VLAN interfaces are configured in the same network: R1 and R2 can reach each other using the VLAN connection.

Note: A VLAN ID of both VLAN interfaces is the same (10). Two systems with different VLAN IDs cannot communicate, even if they are in the same network, since a VLAN ID tags packets sent on a VLAN interface.

Create a VLAN Interface

When a VLAN interface is configured, a Layer 3 interface based on the bridge-group number and VLAN ID is created. This Layer 3 interface is advertised to all the Layer 3 protocols.

`#configure terminal`	Enter Configure mode.
`(config)#bridge 1 protocol mstp`	Create a MSTP bridge.
`(config)#vlan database`	Enter VLAN mode.

VLAN Interfaces

`(config-vlan)#vlan 10 bridge 1`	Enable VLAN 10 on bridge 1.
`(config-vlan)#exit`	Exit VLAN mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#switchport`	Configure interface as Layer2 interface.
`(config-if)#bridge-group 1`	Associate bridge group 1.

`(config-if)#switchport mode trunk`	Configure interface eth1 as Layer2 trunk mode.
`(config-if)#switchport trunk allowed vlan add 10`	Associate VLAN 10 as trunk port.
`(config-if)#exit`	Exit interface mode.

Add IP Addresses to VLAN Interface

In NSM, you can add or remove IP addresses from VLAN interfaces, like normal interfaces. Using IMISH type:

```
#configure terminal
(config)#interface vlan1.10
(config-if)#ip address 192.168.1.50/24
```

Display VLAN Interfaces

In SWMRE, VLAN interfaces appear as any physical interfaces, in the `show running-config` or the `show ip interface brief` outputs, and can be configured as any other interface.

The following is a sample output of the `show ip interface brief` command on R1.

Note:The IP address of interface `eth1.1` has correctly been changed by NSM:

```
#show ip interface brief
Interface          IP-Address      Status                    Protocol
lo                 127.0.0.1       up                        up gre0
unassigned       administratively down    down eth0
10.70.0.77      up                        up
.... sit0               unassigned      administratively down
down vlan1.10             192.168.1.50    up
up tunl0              unassigned      administratively down
down
```

Below is the NSM routing table, which shows the connected network `192.168.1.0/24` of `eth1.10`. These interfaces will now act as any physical interfaces, and all routing protocols will run across this network.

```
#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter
       area * - candidate default
Gateway of last resort is 10.70.0.1 to network 0.0.0.0
K*      0.0.0.0/0 via 10.70.0.1, eth0
B       2.2.2.0/24 [200/0] via 192.168.1.145, eth4.2, 01:14:38
....
C       127.0.0.0/8 is directly connected, lo
K       169.254.0.0/16 is directly connected, eth4
```

```
C       192.168.1.0/24 is directly connected, vlan1.10
```

CHAPTER 13 Layer 3 Link Aggregation

This chapter contains a complete sample Link Aggregation Control Protocol (LACP) configuration (L3 LAG).

Link Aggregation is the method of combining individual physical network interfaces or ports to increase the capacity of the link to support and sustain beyond the individual port capability. Features like Spanning Tree, VLAN, FDB, Multicast operate on both physical ports as well as Link Aggregated Logical Ports. It bundles all of the controller's distribution system ports into a single 802.3ad port channel, thereby reducing the number of IP addresses needed to configure the ports on your controller. When LAG is enabled, the system dynamically manages port redundancy and load balances access points transparently to the user.

LACP is based on the 802.3ad IEEE specification. It allows bundling of several physical interfaces to form a single logical channel providing enhanced performance and redundancy. The aggregated interface is viewed as a single link to each switch. The spanning tree views it as one interface and not as two or three interfaces. When there is a failure in one physical interface, the other interfaces stay up and there is no disruption.

The SWMRE LACP implementation supports the aggregation of a maximum of six physical Ethernet links into a single logical channel.

Topology

In this example, 3 links are configured between the two switches R1 and R2. These three links are assigned the same administrative key (1) so that they aggregate to form a single channel 1. They are viewed by STP as one interface.

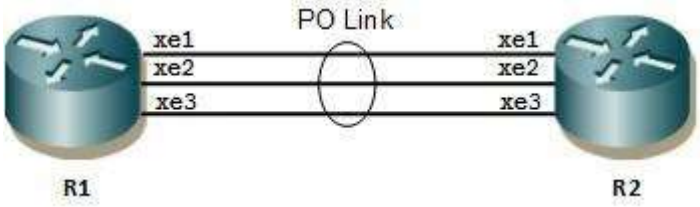

Figure 13-91: L3_LAG Topology

Configuration

R1

`R1#configure terminal`	Enter configure mode.
`R1(config)#lacp system-priority 20000`	Set the system priority of this switch. This priority is used for determining the system that is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.
`R1(config)#interface xe1`	Enter interface mode.
`R1(config-if)#no switchport`	Making Interface as L3 Port

R1(config-if)#channel-group 10 mode active	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
R1(config-if)#exit	Exit interface mode.
R1(config)#interface xe2	Enter interface mode.
R1(config-if)#no switchport	Making Interface as L3 Port

Layer 3 Link Aggregation

R1(config-if)#channel-group 10 mode active	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
R1(config-if)#exit	Exit interface mode.
R1(config)#interface xe3	Enter interface mode.
R1(config-if)#no switchport	Making Interface as L3 Port
R1(config-if)#channel-group 10 mode active	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
R1(config-if)#exit	Exit interface mode.
R1(config)#interface po10	Enter interface mode.
R1(config-if)#ip address 1.1.1.1/24	Assigning IP Address to PO Interface
R1(config-if)#exit	Exit interface mode.

R2

R2#configure terminal	Enter configure mode.
R2(config)#lacp system-priority 20000	Set the system priority of this switch. This priority is used for determining the system that is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.
R2(config)#interface xe1	Enter interface mode.
R2(config-if)#no switchport	Making Interface as L3 Port
R2(config-if)#channel-group 10 mode active	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
R2(config-if)#exit	Exit interface mode.
R2(config)#interface xe2	Enter interface mode.
R2(config-if)#no switchport	Making Interface as L3 Port
R2(config-if)#channel-group 10 mode active	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
R2(config-if)#exit	Exit interface mode.
R2(config)#interface xe3	Enter interface mode.
R2(config-if)#no switchport	Making Interface as L3 Port

R2(config-if)#channel-group 10 mode active	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
R2(config-if)#exit	Exit interface mode.
R1(config)#interface po10	Enter interface mode.
R1(config-if)#ip address 1.1.1.2/24	Assigning IP Address to PO Interface
R1(config-if)#exit	Exit interface mode.

Layer 3 Link Aggregation

Static Channel-group

R1

R1#configure terminal	Enter configure mode.
R1(config)#interface xe1	Enter interface mode.
R1(config-if)#static-channel-group 12	Add this interface to channel group 12 and enable link aggregation so that it can be selected for aggregation by the local system.
R1(config-if)#exit	Exit interface mode.
R1(config)#interface sa12	Enter interface mode.
R1(config-if)#no switchport	Making Interface as L3 Port
R1(config-if)#ip address 2.2.2.1/24	Assigning IP Address to PO Interface
R1(config-if)#exit	Exit interface mode.

R2

R2#configure terminal	Enter configure mode.
R2(config)#interface xe1	Enter interface mode.
R2(config-if)#static-channel-group 12	Add this interface to channel group 12 and enable link aggregation so that it can be selected for aggregation by the local system.
R2(config-if)#exit	Exit interface mode.
R2(config)#interface sa12	Enter interface mode.
R2(config-if)#no switchport	Making Interface as L3 Port
R2(config-if)#ip address 2.2.2.2/24	Assigning IP Address to PO Interface
R2(config-if)#exit	Exit interface mode.

CHAPTER 9 Static Routes

This chapter contains basic static routing configuration examples.

This example shows the complete configuration to enable static routing in a simple network topology. A static route is composed of a network prefix (host address) and a nexthop (gateway). Static routes are useful in small networks. They are simple solutions for making a few destinations reachable. Large networks use dynamic routing protocols.

For details about the commands used in these examples, see the *Unicast Routing Information Base Command Reference*.

Topology

Router R1 is configured with these static routes:

- The remote network 10.10.12.0/24
- The loopback address (host addresses) of router R2
- The loopback address of router R3

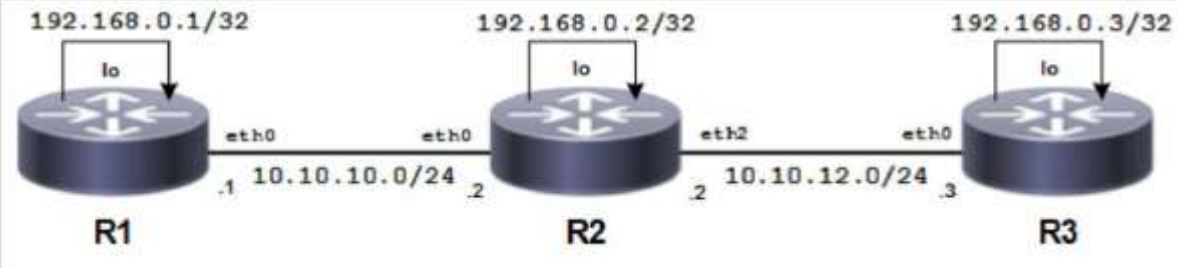

Figure 15-93: Basic Static Route

In all three routes, interface `eth0` of router R2 is the gateway. Router R3 is configured with a default static route that is equivalent to configuring separate static routes with the same gateway or nexthop address. Router R2 has two routes, one for each of the remote routers' loopback address.

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 192.168.0.1/32`	Configure the IP address on this interface, and specify a 32bit mask, making it a host address.
`(config-if)#exit`	Exit interface mode.

`(config)#ip route 10.10.12.0/24 10.10.10.2`
`(config)#ip route 192.168.0.2/32 10.10.10.2`
`(config)#ip route 192.168.0.3/32 10.10.10.2`
	Specify the destination prefix and mask for the network and a gateway.
	Because R2 is the only next hop available, you can configure a default route instead of configuring the same static route for individual addresses. See the configuration of R3.

R2

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 192.168.0.2/32	Configure the IP address on this interface, and specify a 32bit mask, making it a host address.
(config-if)#exit	Exit Interface mode.
(config)#ip route 192.168.0.1/32 10.10.10.1 (config)#ip route 192.168.0.3/32 10.10.12.3	Specify the destination and mask for the network and a gateway.

R3

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 192.168.0.3/32	Configure the IP address on this interface, and specify a 32bit mask, making it a host address.
(config-if)#exit	Exit Interface mode.
(config)#ip route 0.0.0.0/0 10.10.12.2	Specify 10.10.12.2 as a default gateway to reach any network. Because 10.10.12.2 is the only available route, you can specify it as the default gateway instead of specifying it as the gateway for an individual network or host address.

CHAPTER 10 Static Route Discard Configuration

This chapter show how to configure the static route discard feature.

Overview

If you identify some routers/attackers distributing invalid/bogus routes just to use the resources of the device or to make the device unstable, you can configure route-map rules, discard all routes, and black hole traffic corresponding to those routes.

To so this, you add “discard” route entries for a prefix in a route map with the “set interface null0” command. You then apply that route map to a BGP neighbor.

IPv4 Route Discard

Figure 16-94 shows the configuration required to enable static route discard for IPv4.

Topology

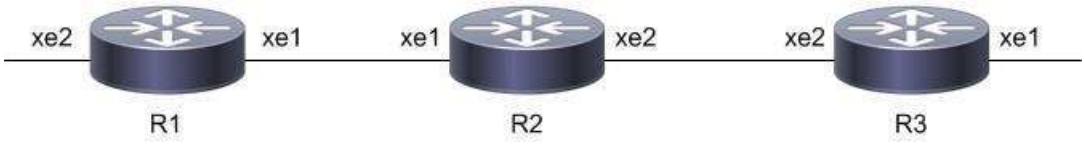

Figure 16-94: Static route discard topology

Configuration

R1

`R1#configure terminal`	Enter Configure mode
`R1(config)#interface xe1`	Enter interface mode for xe1
`R1(config-if)#ip address 2.2.2.2/24`	Assign an IP address to the interface
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#interface xe2`	Enter interface mode for xe1
`R1(config-if)#ip address 1.1.1.2/24`	Assign an IP address to the interface
`R1(config-if)#exit`	Exit interface mode
`R1(config)#router bgp 2`	Enter BGP router mode
`R1(config-router)#neighbor 2.2.2.3 remote-as 3`	Create static BGP neighbor 2.2.2.3 with remote autonomous system value 3
`R1(config-router)#redistribute connected`	Advertise the connected network into BGP
`R1(config-router)#end`	Exit BGP router mode

R2

R2#configure terminal	Enter configure mode
R2(config)#ip prefix-list p1 permit any	Configure IP prefix list
R2(config)#route-map r1	Enter route-map mode
R2(config-route-map)#match ip address prefix-list p1	Configure match ip prefix list p1
R2(config-route-map)#set interface null0	Set the interface to null0
R2(config-route-map)#exit	Exit route-map mode.
R2(config)#interface xe1	Enter interface mode for xe1
R2(config-if)#ip address 2.2.2.3/24	Assign an IP address to the interface
R2(config-if)#exit	Exit interface mode.
R2(config)#interface xe2	Enter interface mode for xe2
R2(config-if)#ip address 3.3.3.2/24	Assign an IP address to the interface
R2(config-if)#exit	Exit interface mode
R2(config)#router bgp 3	Enter into BGP router mode
R2(config-router)#neighbor 2.2.2.2 remote-as 2	Create static BGP neighbor 2.2.2.2 with remote autonomous system value 2
R2(config-router)#neighbor 3.3.3.3 remote-as 4	Create static BGP neighbor 3.3.3.3 with remote autonomous system value 4
R2(config-router)#redistribute connected	Advertise the connected network into BGP
R2(config-router)#neighbor 2.2.2.2 route-map r1 in	Attach the route-map with route discard configured for the neighbor 2.2.2.2 in IN direction
R2(config-router)#end	Exit BGP router mode

R3

R3#configure terminal	Enter configure mode.
R3(config)#interface xe2	Enter interface mode for xe2
R3(config-if)#ip address 3.3.3.3/24	Assign an IP address to the interface
R3(config-if)#exit	Exit interface mode
R3(config)#interface xe1	Enter interface mode for xe1
R3(config-if)#ip address 4.4.4.2/24	Assign an IP address to the interface
R3(config-if)#exit	Exit interface mode.
R3(config)#router bgp 4	Enter into BGP router mode
R3(config-router)#neighbor 3.3.3.2 remote-as 3	Create static BGP neighbor 3.3.3.2 with remote autonomous system value 3
R3(config-router)#redistribute connected	Advertise the connected network into BGP
R3(config-router)#end	Exit BGP router.

IPv6 Route Discard

Figure 16-94 shows the configuration required to enable static route discard for IPv6.

Configuration

R1

`R1#configure terminal`	Enter Configure mode.
`R1(config)#interface lo`	Enter interface mode for loopback
`R1(config-if)#ip address 1.1.1.2/24 secondary`	Assign an IPv4 address to the interface
`R1(config-if)#exit`	Exit interface mode
`R1(config)#interface xe1`	Enter interface mode for xe1
`R1(config-if)#ipv6 address 2001::2/64`	Assign an IPv6 address to the interface
`R1(config-if)#exit`	Exit interface mode
`R1(config)#interface xe2`	Enter interface mode for xe2
`R1(config-if)#ipv6 address 1001::2/64`	Assign an IPv6 address to the interface
`R1(config-if)#exit`	Exit interface mode
`R1(config)#router bgp 2`	Enter BGP router mode
`R1(config-router)#neighbor 2001::3 remote-as 3`	Create static BGP neighbor 2001::3 with remote autonomous system value 3
`R1(config-router)#address-family ipv6 unicast`	Enter address family IPv6 unicast mode
`R1(config-router-af)#neighbor 2001::3 activate`	Activate neighbor in IPv6 address family
`R1(config-router-af)#redistribute connected`	Advertise the connected network into BGP
`R1(config-router)#end`	Exit BGP router mode

R2

`R2#configure terminal`	Enter configure mode
`R2(config)#interface lo`	Enter Interface mode for loopback
`R2(config-if)#ip address 2.2.2.2/24 secondary`	Assign an IPV4 address
`R2(config-if)#exit`	Exit Interface mode
`R2(config)#ipv6 prefix-list p1 permit any`	Configure IPv6 prefix list.

R2(config)#route-map r1	Enter route-map mode.
R2(config-route-map)#match ipv6 address prefix-list p1	Configure match IPv6 prefix list p1
R2(config-route-map)#set interface null0	Set the interface to null0
R2(config-route-map)#exit	Exit route-map mode
R2(config)#interface xe1	Enter interface mode for xe1
R2(config-if)#ipv6 address 2001::3/64	Assign ipv6 address to the interface
R2(config-if)#exit	Exit interface mode
R2(config)#interface xe2	Enter interface mode for xe2
R2(config-if)#ipv6 address 3001::2/64	Assign an IPv6 address to the interface
R2(config-if)#exit	Exit interface mode
R2(config)#router bgp 3	Enter BGP router mode
R2(config-router)#neighbor 2001::2 remote-as 2	Create static BGP neighbor 2001::2 with remote autonomous system value 2
R2(config-router)#neighbor 3001::3 remote-as 4	Create static BGP neighbor 3001::3 with remote autonomous system value 4
R2(config-router)#address-family ipv6 unicast	Enter address family IPv6 unicast mode
R2(config-router-af)#redistribute connected	Advertise the connected network into BGP
R2(config-router-af)#neighbor 2001::2 activate	Activate the neighbor in IPv6 address family
R2(config-router-af)#neighbor 3001::3 activate	Activate the neighbor in IPv6 address family
R2(config-router-af)#neighbor 2001::2 routemap r1 in	Attach the route-map with route discard configured for the neighbor 2001::2 in IN direction
R2(config-router)#end	Exit BGP router mode

R3

R3#configure terminal	Enter configure mode
R3(config)#interface lo	Enter interface mode for loopback
R3(config-if)#ip address 3.3.3.2/24 secondary	Assign an IPV4 address to the interface
R3(config-if)#exit	Exit interface mode
R3(config)#interface xe1	Enter interface mode for xe1
R3(config-if)#ipv6 address 4001::2/64	Assign an IPv6 address to the interface
R3(config-if)#exit	Exit interface mode
R3(config)#interface xe2	Enter interface mode for xe2
R3(config-if)#ipv6 address 3001::3/64	Assign an IPv6 address to the interface
R3(config-if)#exit	Exit interface mode
R3(config)#router bgp 4	Enter into BGP router mode

R3(config-router)#neighbor 3001::2 remote-as 3	Create static BGP neighbor 3001::2 with remote autonomous system value 3
R3(config-router)#address-family ipv6 unicast	Enter address family IPv6 unicast mode
R3(config-router-af)#neighbor 3001::2 activate	Activate neighbor in IPv6 address family
R3(config-router-af)#redistribute connected	Advertise the connected network into BGP
R3(config-router)#end	Exit BGP router mode.

Validation

```
R2#sh running-config bgp !
router bgp 3
 neighbor  2001::2  remote-as  2    neighbor
3001::3 remote-as 4

CHAPTER 11 RIP

This chapter contains basic Router Information Protocol (RIP) configuration examples.

For details about the commands used in these examples, see the *Routing Information Protocol Command Reference*.

Enable RIP

This example shows the minimum configuration required to enable RIP on an interface. R1 and R2 are two routers connecting to network 10.10.11.0/24. R1 and R2 are also connected to networks 10.10.10.0/24 and 10.10.12.0/24, respectively. To enable RIP, first define the RIP routing process, then associate a network with the routing process.

Topology

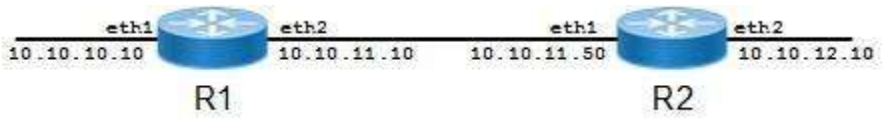

Figure 17-95: Enable RIP Topology

R1

`#configure terminal`	Enter Configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.10.0/24` `(config-router)#network 10.10.11.0/24`	Associate networks with the RIP process.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.11.0/24` `(config-router)#network 10.10.12.0/24`	Associate networks with the RIP process.

Specify RIP Version

Configure a router to receive and send specific versions of packets on an interface. In this example, router R2 is configured to receive and send RIP version 1 and version 2 information on both eth1 and eth2 interfaces.

Topology

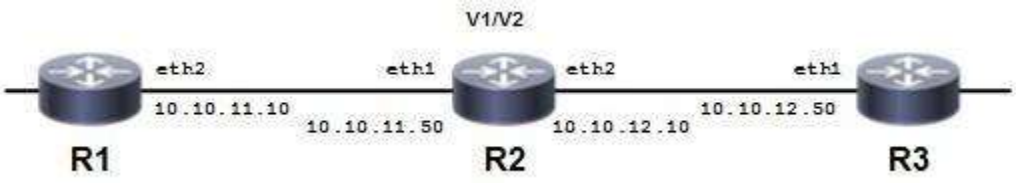

Figure 17-96: RIP Version Topology

R2

`#configure terminal`	Enter Configure mode.
`(config)#router rip`	Enable the RIP routing process.
`(config-router)#exit`	Quit Router mode, and return to Configure mode.
`(config)#interface eth1`	Specify interface `eth1` as an interface you want to configure.
`(config-if)#ip rip send version 1 2`	Allow sending RIP version 1 and version 2 packets out of this interface.
`(config-if)#ip rip receive version 1 2`	Allow receiving RIP version 1 and version 2 packets from the `eth1` interface.
`(config-if)#quit`	Quit Interface mode, and return to Configure mode to configure the next interface.
`(config)#interface eth2`	Specify interface `eth2` as the interface you want to configure.
`(config-if)#ip rip send version 1 2`	Allow sending RIP version 1 and version 2 packets out of this interface.
`(config-if)#ip rip receive version 1 2`	Allow receiving RIP version 1 and version 2 packets from the `eth2` interface.

Authentication with a Single Key

SWMRE RIP provides a choice of configuring authentication with a single key or with multiple keys. This example shows authenticating routing information exchange using a single key.

Topology

Routers R1 and R2 are running RIP and exchanging routing updates. To configure single-key authentication on R1, specify an interface, then define a key or password for that interface. Next, specify an authentication mode. Any receiving RIP packet on this specified interface should have the same string as the password. For an exchange of updates between R1 and R2, define the same password and authentication mode on R2.

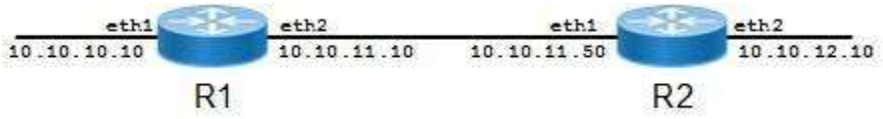

Figure 17-97: Single-key Topology

R1

`#configure terminal`	Enter Configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.10.0/24`	Associate network `10.10.10.0/24` with the RIP process.
`(config-router)#redistribute connected`	Enable redistributing from connected routes.
`(config-router)#exit`	Quit Router mode, and return to Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) for authentication.
`(config-if)#ip rip authentication string ABC`	Specify the authentication string (`ABC`) for this interface.
`(config-if)#ip rip authentication mode md5`	Specify the authentication mode to be MD5.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.10.0/24`	Associate network `10.10.10.0/24` with the RIP process.
`(config-router)#redistribute connected`	Enable redistributing from connected routes.
`(config-router)#exit`	Quit Router mode, and return to Configure mode.
`(config)#interface eth2`	Specify the interface (`eth2`) for authentication.
`(config-if)#ip rip authentication string ABC`	Specify the authentication string (`ABC`) on this interface.
`(config-if)#ip rip authentication mode md5`	Specify the authentication mode to be MD5.

Text Authentication with Multiple Keys

This example illustrates text authentication of the routing information exchange process for RIP using multiple keys. Routers R1 and R2 are running RIP, and exchanging routing updates. To configure authentication on R1, define a key chain, specify keys in the key chain, then define the authentication string or passwords to use by the keys. Set the time period during which it is valid to receive or send the authentication key by specifying the accept and send lifetimes. After defining the key string, specify the key chain (or set of keys) that will be used for authentication on each interface, and the authentication mode to use.

R1 receives all packets that contain any key string that matches one of the key strings included in the specified key chain (within the accept lifetime) on that interface. The key ID is not considered for matching. For additional security, the accept lifetime and send lifetime are configured such that every fifth day, the key ID and key string changes. To maintain continuity, the accept lifetimes should be configured to overlap. This will accommodate different time setup on machines. However, the send lifetime is not required to overlap, and Symanitron recommends configuring no overlapping for the send lifetime.

Topology

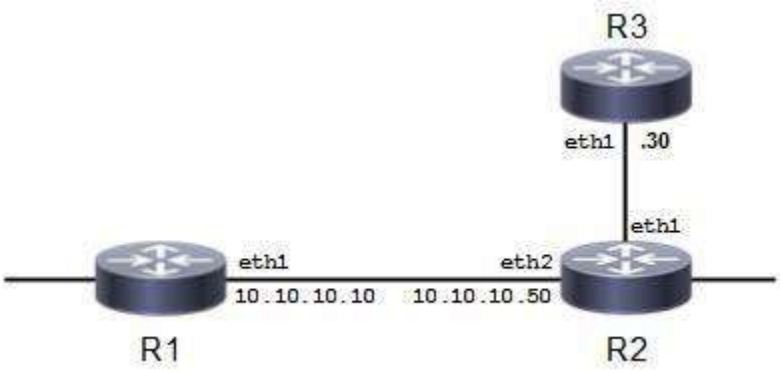

Figure 17-98: Multiple-key Topology

R1

`#configure terminal`	Enter Configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.

(config-router)#network 10.10.10.0/24	Associate network 10.10.10.0/24 with the RIP process.
(config-router)#redistribute connected	Enable redistributing from connected routes.
(config-router)#exit	Quit Router mode, and return to Configure mode.
(config)#key chain SUN	Enter Keychain management mode to add keys to the key chain SUN.
(config-keychain)#key 10	Add authentication key ID (10) to the key chain SUN.
(config-keychain-key)#key-string ABC	Specify a password (ABC) to use by the specified key.
(config-keychain-key)#accept-lifetime 12:00:00 Mar 2 2003 14:00:00 Mar 7 2003	Specify the time period during which the authentication key can be received. In this case, key string ABC can be received from noon of March 2 to 2 pm March 7, 2003.
(config-keychain-key)#send-lifetime 12:00:00 Mar 2 2003 12:00:00 Mar 7 2003	Specify the time period during which the authentication key can be sent. In this case, key string ABC can be sent from noon of March 2 to noon of March 7, 2003.
(config-keychain-key)#exit	Exit Keychain-Key mode, and return to Keychain mode.
(config-keychain)#key 20	Add another authentication key (20) to the key chain SUN.
(config-keychain-key)#key-string Earth	Specify a password (Earth) to use by the specified key.
(config-keychain-key)#accept-lifetime 12:00:00 Mar 7 2003 14:00:00 Mar 12 2003	Specify the time period during which authentication key string Earth can be received. In this case, key string Earth can be received from noon of March 7 to 2 pm March 12, 2003.
(config-keychain-key)#send-lifetime 12:00:00 Mar 7 2003 12:00:00 Mar 12 2003	Specify the time period during which the authentication key can be sent. In this case, key string Earth can be sent from noon of March 7 to noon of March 12, 2003.
(config-keychain-key)#end	Enter Privileged Exec mode.
#configure terminal	Enter Configure mode.
(config)#interface eth1	Specify interface eth1 as the interface you want to configure.
(config-if)#ip rip authentication key chain SUN	Enable RIPv2 authentication on eth1 interface and specify the key chain SUN to use for authentication.
(config-if)#ip rip authentication mode text	Specify text authentication mode to use for RIP packets. This step is optional, because text is the default mode.
R2	
#configure terminal	Enter Configure mode.
(config)#router rip	Define a RIP routing process, and enter Router mode.
(config-router)#network 10.10.10.0/24	Associate network 10.10.10.0/24 with the RIP process.
(config-router)#redistribute connected	Enable redistributing from connected routes.
(config-router)#exit	Quit Router mode, and return to Configure mode.

(config)#key chain MOON	Enter Keychain management mode to add keys to the key chain MOON.
(config-keychain)#key 30	Add authentication key ID (30) to the key chain MOON.
(config-keychain-key)#key-string ABC	Specify a password (ABC) to use by the specified key.
(config-keychain-key)#accept-lifetime 12:00:00 Mar 2 2003 14:00:00 Mar 7 2003	Specify the time period during which the authentication key can be received. In this case, key string ABC can be received from noon of March 2 to 2 pm March 7, 2003.
(config-keychain-key)#send-lifetime 12:00:00 Mar 2 2003 12:00:00 Mar 7 2003	Specify the time period during which the authentication key can be sent. In this case, key string ABC can be sent from noon of March 2 to noon of March 7, 2003.
(config-keychain)#key 40	Add another authentication key (40) to the key chain MOON.
(config-keychain-key)#key-string Earth	Specify a password (Earth) to use by the specified key.
(config-keychain-key)#accept-lifetime 12:00:00 Mar 7 2003 14:00:00 Mar 12 2003	Specify the time period during which authentication key string Earth can be received. In this case, key string Earth can be received from noon of March 7 to 2 pm March 12, 2003.
(config-keychain-key)#send-lifetime 12:00:00 Mar 7 2003 12:00:00 Mar 12 2003	Specify the time period during which the authentication key can be sent. In this case, key string Earth can be sent from noon of March 7 to noon of March 12, 2003.
(config-keychain-key)#end	Enter Privileged Exec mode.
#configure terminal	Enter Configure mode.
(config)#interface eth2	Specify interface eth2 as the interface you want to configure.
(config-if)#ip rip authentication key chain MOON	Enable RIPv2 authentication on the eth1 interface, and specify the key chain MOON to use for authentication.
(config-if)#ip rip authentication mode text	Specify the authentication mode to use for RIP packets. This step is optional, because text is the default mode.

```

MD5 Authentication with Multiple Keys

This example illustrates the MD5 authentication of the routing information exchange process for RIP using multiple keys. Routers R1 and R2 are running RIP, and exchanging routing updates. To configure authentication on R1, define a key chain, specify keys in the key chain, then define the authentication string or passwords to use by the keys. Then, set the time period during which it is valid to receive or send the authentication key by specifying the accept and send lifetimes. After defining the key string, specify the key chain (or the set of keys) that will be used for authentication on the interface, and the authentication mode to use. Configure R2 and R3 to have the same key ID and key string as R1 for the time that updates are to be exchanged.

In MD5 authentication, both the key ID and key string are matched for authentication. R1 will receive only packets that match both the key ID and the key string in the specified key chain (within the accept lifetime) on that interface. In the following example, R2 has the same key ID and key string as R1. For additional security, the accept lifetime and send lifetime are configured such that every fifth day, the key ID and key string changes. To maintain continuity, the accept lifetimes should be configured to overlap; however, the send lifetime should not overlap.

Topology

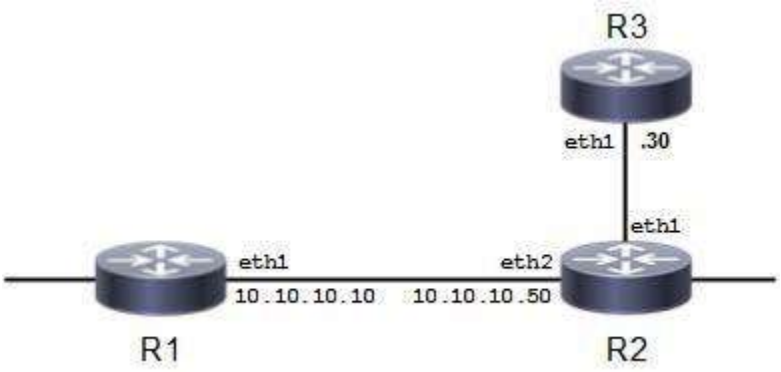

Figure 17-99: MD5 Multiple-key Topology

R1

`#configure terminal`	Enter Configure mode.
`(config)#router rip`	Define a RIP routing process, and enter Router mode.
`(config-router)#network 10.10.10.0/24`	Associate network `10.10.10.0/24` with the RIP process.
`(config-router)#redistribute connected`	Enable redistributing from connected routes.
`(config-router)#exit`	Quit Router mode, and return to Configure mode.
`(config)#key chain SUN`	Enter Keychain management mode to add keys to the key chain `SUN`.
`(config-keychain)#key 1`	Add authentication key ID (`1`) to the key chain `SUN`.
`(config-keychain-key)#key-string ABC`	Specify a password (`ABC`) to use by the specified key.
`(config-keychain-key)#accept-lifetime 12:00:00 Mar 2 2003 14:00:00 Mar 7 2003`	Specify the time period during which the authentication key can be received. In this case, key string `ABC` can be received from noon of March 2 to 2 pm March 7, 2003.
`(config-keychain-key)#send-lifetime 12:00:00 Mar 2 2003 12:00:00 Mar 7 2003`	Specify the time period during which the authentication key can be sent. In this case, key string `ABC` can be sent from noon of March 2 to noon of March 7, 2003.

(config-keychain-key)#exit	Exit Keychain-Key mode, and return to Keychain mode.
(config-keychain)#key 2	Add another authentication key (2) to the key chain SUN.
(config-keychain-key)#key-string Earth	Specify a password (Earth) to use by the specified key.
(config-keychain-key)#accept-lifetime 12:00:00 Mar 7 2003 14:00:00 Mar 12 2003	Specify the time period during which authentication key string Earth can be received. In this case, key string Earth can be received from noon of March 7 to 2 pm March 12, 2003.
(config-keychain-key)#send-lifetime 12:00:00 Mar 7 2003 12:00:00 Mar 12 2003	Specify the time period during which the authentication key can be sent. In this case, key string Earth can be sent from noon of March 7 to noon of March 12, 2003.
(config-keychain-key)#end	Enter Privileged Exec mode.
#configure terminal	Enter Configure mode.
(config)#interface eth1	Specify interface eth1 as the interface you want to configure.
(config-if)#ip rip authentication key chain SUN	Enable RIPv2 authentication on the eth1 interface, and specify the key chain SUN to use for authentication.
(config-if)#ip rip authentication mode md5	Specify MD5 authentication mode to use for RIP packets.

R2

#configure terminal	Enter Configure mode.
(config)#router rip	Define a RIP routing process, and enter Router mode.
(config-router)#network 10.10.10.0/24	Associate network 10.10.10.0/24 with the RIP process.
(config-router)#redistribute connected	Enable redistributing from connected routes.
(config-router)#exit	Quit Router mode, and return to Configure mode.
(config)#key chain MOON	Enter Keychain management mode to add keys to the key chain MOON.
(config-keychain)#key 1	Add authentication key ID (1) to the key chain MOON.
(config-keychain-key)#key-string ABC	Specify a password (ABC) to use by the specified key.
(config-keychain-key)#accept-lifetime 12:00:00 Mar 2 2003 14:00:00 Mar 7 2003	Specify the time period during which the authentication key can be received. In this case, key string ABC can be received from noon of March 2 to 2 pm March 7, 2003.
(config-keychain-key)#send-lifetime 12:00:00 Mar 2 2003 12:00:00 Mar 7 2003	Specify the time period during which the authentication key can be sent. In this case, key string ABC can be sent from noon of March 2 to noon of March 7, 2003.
(config-keychain)#key 2	Add another authentication key (2) to the key chain MOON.
(config-keychain-key)#key-string Earth	Specify a password (Earth) to use by the specified key.

`(config-keychain-key)#accept-lifetime 12:00:00 Mar 7 2003 14:00:00 Mar 12 2003`	Specify the time period during which the authentication key can be received. In this case, key string `Earth` can be received from noon of March 7 to 2 pm March 12, 2003.
`(config-keychain-key)#send-lifetime 12:00:00 Mar 7 2003 12:00:00 Mar 12 2003`	Specify the time period during which the authentication key can be sent. In this case, key string `Earth` can be sent from noon of March 7 to noon of March 12, 2003.
`(config-keychain-key)#end`	Enter Privileged Exec mode.
`#configure terminal`	Enter Configure mode.
`(config)#interface eth2`	Specify interface `eth2` as the interface you want to configure.
`(config-if)#ip rip authentication key chain MOON`	Enable RIPv2 authentication on the `eth1` interface, and specify the key chain `MOON` to use for authentication.
`(config-if)#ip rip authentication mode md5`	Specify the authentication mode to use for RIP packets.

address-family

Use the address family command to enter the IPv4 or VPNv4 address family mode allowing configuration of addressfamily specific parameters. To leave the address family mode and return to the Configure mode use the `exitaddress-family` command.

This command configures the routing exchange between Provider Edge (PE) and Customer Edge (CE) devices. The BGP sessions between PE routers can carry different types of routes (VPN-IPv4 and IPv4 routes). Address families are used to control the type of BGP session. Configure a BGP address family for each VRF configured on the PE router and a separate address family to carry VPN-IPv4 routes between PE routers. All non VPN BGP neighbors are defined using router mode. All VPN BGP neighbors are defined under its associated address family mode. The BGP process with no address-family specified is the default address-family, where any sessions are configured that either are not associated with a VRF or are used to carry IPv4 routes.

Use the `no` parameter with this command to disable the address-family configurations.

Command Syntax `address-family ipv4 address-family ipv4 (unicast|multicast) address-family ipv4 vrf NAME address-family l2vpn evpn address-family rtfilter unicast address-family vpn4 address-family vpn4 unicast no address-family ipv4 vrf NAME no address-family ipv4 multicast no address-family l2vpn evpn no address-family rtfilter unicast no address-family vpnv4 no address-family vpnv4 unicast`

Parameters

`ipv4`	IPv4 address family
`unicast`	Unicast address prefixes
`multicast`	Multicast address prefixes
`vrf`	Virtual Private Network (VPN) routing/forwarding instance
`NAME`	VPN routing/forwarding instance name
`unicast`	Unicast address prefixes
`l2vpn evpn`	Layer 2 VPN routing sessions with EVPN endpoint information distributed to BGP peers
`rtfilter`	Route target filter: on an iBGP peer or Route Reflector (RR), only send IPv4 and IPv6 prefixes to PE routers when a PE has a VRF that imports those specific prefixes.
`unicast`	Unicast address prefixes
`vpnv4`	VPN version 4 address family
`unicast`	Unicast address prefixes

Applicability

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 7657
(config-router)#neighbor 3ffe:506::1 remote-as 7657
(config-router)#neighbor 3ffe:506::1 interface eth1
```

```
#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv4 (config-
router-af)#neighbor 3ffe:506::1 activate
(config-router-af)#exit-address-family
```

aggregate-address

Use this command to configure BGP aggregate entries.

Aggregates are used to minimize the size of routing tables. Aggregation combines the characteristics of several different routes and advertises a single route.The `aggregate-address` command creates an aggregate entry in the BGP routing table if any more-specific BGP routes are available in the specified range. Using the `summary-only` parameter advertises the prefix only, suppressing the more-specific routes to all neighbors. In the following example Router1 will propagate network 172.0.0.0 and suppresses the more specific route 172.10.0.0.

The `as-set` parameter creates an aggregate entry advertising the path for this route, consisting of all elements contained in all paths being summarized. Use this parameter to reduce the size of information by listing the AS path number only once, even if it was included in multiple paths that were aggregated. `as-set` parameter is useful when The aggregation of information results in an incomplete path information.

Use the `no` parameter with this command to disable this function.

Command Syntax `aggregate-address A.B.C.D/M aggregate-address A.B.C.D/M as-set aggregate-address A.B.C.D/M as-set summary-only aggregate-address A.B.C.D/M summary only aggregate-address A.B.C.D/M summary-only as-set no aggregate-address A.B.C.D/M no aggregate-address A.B.C.D/M as-set no aggregate-address A.B.C.D/M as-set summary-only no aggregate-address A.B.C.D/M summary only no aggregate-address A.B.C.D/M summary-only as-set`

Parameters

`A.B.C.D/M` Aggregate prefix `as-set`

Generate AS set path information

`summary-only` Filter more specific routes from updates

Default

By default, aggregate address A.B.C.D/M is disabled

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
    #configure terminal
    (config)#router bgp 100
    (config-router)#aggregate-address 10.0.0.0/8 as-set summary-only
(config)#router bgp 100
```

```
(config-router)#no aggregate-address 10.0.0.0/8 as-set summary-only
```

auto-summary

Use this command to enable sending summarized routes by a BGP speaker to its peers in the router configuration mode or in the address-family configuration mode. Auto-summary is used by a BGP router to advertise summarized routes to its peers. Auto-summary can be enabled if certain routes have already been advertised: in this case, configuring auto-summary advertises the summarized routes first, then corresponding non-summarized routes are withdrawn. If certain routes have already been advertised, and auto-summary is disabled, non-summarized routes are first advertised, then the corresponding summarized routes are withdrawn from all the connected peers.

Use the `no` parameter with this command to disable this function.

Command Syntax `auto-summary no auto-summary`

Parameters

None

Default

By default, auto-summary is disabled

Command Mode

Router mode and Address Family mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following example enables auto-summary in Router mode.

```
#configure terminal
(config)#router bgp 11
(config-router)#auto-summary
```

The following example enables auto-summary using the IPv4 address family.

```
#configure terminal
(config)#router bgp 1
(config)#address-family ipv4
(config-af)#auto-summary
```

bgp additional-paths

Use this command to enable BGP add-path.

Use the `no` parameter with this command to disable BGP add-path.

Command Syntax `bgp additional-paths (send|receive|send-receive) no bgp additional-paths (send|receive|send-receive)`

Parameters `send` Send additional paths to neighbors `receive` Receive additional paths from neighbors

`send-receive` Send and Receive additional paths from neighbors

Default

By default, bgp additional-paths is disabled

Command Mode

Router BGP Address Family mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 unicast
(config-router)#bgp additional-paths send

(config-router)#no bgp additional-paths send
```

bgp additional-paths select

Use this command to enable BGP add-path advertisement.

Use the `no` parameter with this command to disable BGP add-path advertisement.

Command Syntax `bgp additional-paths select (all|best <2-3>) no bgp additional-paths select (all|best <2-3>)`

Parameters `all` Select all available paths `best` Select best N paths

`<2-3>` Number of best paths in additional paths to be selected

Default

By default, bgp additional-paths select is disabled

Command Mode

Router BGP Address Family mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 unicast
(config-router)#bgp additional-paths select all

(config-router)#no bgp additional-paths select all
```

bgp aggregate-nexthop-check

Use this command to set the BGP option to perform aggregation only when next-hop matches the specified IP address.

Use the `no` parameter with this command to disable this functionality.

Command Syntax `bgp aggregate-nexthop-check` `no bgp aggregate-nexthop-check`

Parameters

None

Default

By default, bgp aggregate nexthop check is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bgp aggregate-nexthop-check
```

bgp always-compare-med

Use this command to compare the Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems. Multi Exit Discriminator (MED) is used in best path selection by BGP. MED is compared after BGP attributes weight, local preference, AS-path and origin have been compared and are equal. MED comparison is done only among paths from the same autonomous system (AS). Use `bgp always-compare-med` command to allow comparison of MEDs from different ASs. The MED parameter is used to select the best path. A path with lower MED is preferred. If the bgp table shows the following and the always-compare-med is enabled:

```
Route1: as-path 400, med 300
Route2: as-path 200, med 200
Route3: as-path 400, med 250
```

Route1 is compared to Route2. Route2 is best of the two (lower MED). Next, Route2 is compared to Route3 and Route2 is chosen best path again (lower MED). If always-compare-med was disabled, MED is not taken into account when Route1 and Route2 are compared, because of different ASs and MED is compared for only Route1 and Route3. In this case, Route3 would be the best path. The selected route is also affected by the `bgp deterministic-med` command. Please see `bgp deterministic-med` command for details. If this command is used to compare MEDs for all paths, it should be configured on every BGP router in the AS. Use the `no` parameter with this command to disallow the comparison.

Command Syntax `bgp always-compare-med` `no bgp always-compare-med`

Parameters

None

Default

By default, bgp always compare med is disabled

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp always-compare-med
```

bgp as-local-count

Use this command to set the number of times the local-AS (Autonomous System) is to be prepended.

Use the `no` parameter with this command to stop prepending the local AS count.

Command Syntax `bgp as-local-count <2-64> no bgp as-local-count <2-64>`

Parameter

`<2-64>`	The number of times the local-AS is to be prepended

Default

By default, bgp as local count is disabled

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp as-local-count 55

(config)#router bgp 100
(config-router)#no bgp as-local-count 55
```

bgp bestpath as-path ignore

Use this command to prevent the router from considering the autonomous system (AS) path length as a factor in the algorithm for choosing a best path route.

Use the `no` parameter with this command to allow the router to consider the AS path length in choosing a best path route.

Command Syntax `bgp bestpath as-path`

```
ignore  no  bgp  bestpath  as-path
ignore
```

Parameters

None

Default

By default, bgp bestpath as-path ignore is disabled

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath as-path ignore

(config)#router bgp 100 (config-router)#no bgp
bestpath as-path ignore
```

bgp bestpath as-path multipath-relax

Use this command to relax the “same AS-Path” requirement so any candidate eBGP AS-Path with the same AS-path length might be used for eBGP load-balancing.

Note: This feature does not load-balance between eBGP and iBGP paths.

Normally eBGP load-balancing requires the candidate routes to be equal-cost paths with identical BGP attributes having the same weight, Local-Pref, AS-Path (both the AS numbers and the AS path length), origin, MED, and different next-hop.

Use the `no` parameter with this command to return to normal operation.

Command Syntax `bgp bestpath as-path multipath-relax no bgp bestpath as-path multipath-relax`

Parameters

None

Default

By default, as-path multipath-relax is disabled

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath as-path multipath-relax

(config)#router bgp 100
(config-router)#no bgp bestpath as-path multipath-relax
```

bgp bestpath compare-confed-aspath

Use this command to allow comparing of the confederation AS path length. This command specifies that the AS confederation path length must be used when available in the BGP best path decision process. It is effective only when bgp bestpath as-path ignore command has not been used.

Use the `no` parameter with this command to ignore consideration of AS confederation path length in BGP best path selection.

Command Syntax `bgp bestpath compare-confed-aspath no bgp bestpath compare-confed-aspath`

Parameters

None

Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath compare-confed-aspath

(config)#router bgp 100
(config-router)#no bgp bestpath compare-confed-aspath
```

bgp bestpath compare-routerid

Use this command to compare router IDs for identical eBGP paths. When comparing similar routes from peers, the BGP router does not consider the router ID of the routes. By default, it selects the first received route. Use this command to include router ID in the selection process; similar routes are compared and the route with the lowest router ID is selected. The router IS is the highest IP address on the router, with preference given to loopback addresses. Router ID can be manually set by using the bgp router-id command.

Use the `no` parameter with this command to disable this functionality.

Command Syntax `bgp bestpath compare-routerid no bgp bestpath compare-routerid`

Parameters

None

Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath compare-routerid

(config)#router bgp 100
(config-router)#no bgp bestpath compare-routerid
```

bgp bestpath dont-compare-originator-id

Use this command to change the default bestpath selection by not comparing an originator-ID for an identical EBGP path.

Use the `no` parameter with this command to disable this functionality.

Command Syntax `bgp bestpath dont-compare-originator-id no bgp bestpath dont-compare-originator-id`

Parameters

None

Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath dont-compare-originator-id

(config)#router bgp 100
(config-router)#no bgp bestpath dont-compare-originator-id
```

bgp bestpath med

Use this command to specify two MED (Multi Exit Discriminator) attributes, `confed` and `missing-as-worst`.

The `confed` attribute enables MED comparison along paths learned from confederation peers. The MEDs are compared only if there is no external Autonomous System (an AS not within the confederation) in the path. If there is an external autonomous system in the path, the MED comparison is not made. For example in the following paths, the MED is not compared with Route3 as it is not in the confederation. MED is compared for Route1 and Route2 only.

```
Path1 = 32000 32004, med=4
Path2 = 32001 32004, med=2
Path3 = 32003 1, med=1
```

The `missing-as-worst` attribute to consider a missing MED attribute in a path as having a value of infinity, making the path without a MED value the least desirable path. If `missing-as-worst` is disabled, the missing MED is assigned the value of 0, making the path with the missing MED attribute the best path.

Use the `no` parameter with this command to prevent BGP from considering the MED attribute in comparing paths.

Command Syntax `bgp bestpath med confed missing-as-worst bgp bestpath med (confed|missing-as-worst|remove-recv-med|remove-send-med) bgp bestpath med missing-as-worst confed no bgp bestpath med confed missing-as-worst no bgp bestpath med (confed|missing-as-worst|remove-recv-med|remove-send-med) no bgp bestpath med missing-as-worst confed`

Parameters `confed` Compare MED along confederation paths

`missing-as-worst`

Treat missing MED as the least preferred one

`remove-recv-med`

Remove received MED attribute

`remove-send-med`

Remove sent MED attribute

Command Mode

Router mode

Default

By default, MED value is zero.

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
```

```
(config)#router bgp 100
(config-router)#bgp bestpath med missing-as-worst

(config)#router bgp 100
(config-router)#bgp bestpath med remove-recv-med
(config-router)#no bgp bestpath med remove-recv-med

(config)#router bgp 100
(config-router)#bgp bestpath med remove-send-med
(config-router)#no bgp bestpath med remove-send-med
```

bgp bestpath tie-break-on-age

Use this command to always select a preferred older route even when the `bgp bestpath compare-routerid` command is configured.

Use the `no` parameter with this command to disable this functionality.

Command Syntax `bgp bestpath tie-break-on-age no bgp bestpath tie-break-on-age`

Parameters

None

Default

By default, tie-break-on-age is disabled

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath tie-break-on-age

(config)#router bgp 100
(config-router)#no bgp bestpath tie-break-on-age
```

bgp client-to-client reflection

Use this command to configure routers as route reflectors. Route reflectors are used when all Interior Border Gateway Protocol (iBGP) speakers are not fully meshed. If the clients are fully meshed the route reflector is not required, use `no bgp client-to-client reflection` command to disable the client-to-client route reflection.

Use the `no` parameter with this command to turn off client-to-client reflection.

Command Syntax `bgp client-to-client reflection no bgp client-to-client reflection`

Parameters

None

Default

When a router is configured as a route reflector, client-to-client reflection is enabled by default.

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp client-to-client reflection

(config)#router bgp 100
(config-router)#no bgp client-to-client reflection
```

bgp cluster-id

Use this command to configure the cluster ID if the BGP cluster has more than one route reflector. A cluster includes route reflectors and its clients. Usually, each cluster is identified by the router ID of its single route reflector but to increase redundancy sometimes a cluster may have more than one route reflector. All router reflectors in such a cluster are then identified by a cluster ID. The `bgp cluster-id` command is used to configure the 4 byte cluster ID for clusters with more than one route reflectors.

Use the `no` parameter with this command (without any arguments) to remove a previously configured route reflector cluster ID.

Command Syntax `bgp cluster-id <1-4294967295> bgp cluster-id A.B.C.D no bgp cluster-id`

Parameters

`<1-4294967295>`	Route reflector ID as a 32-bit quantity
`A.B.C.D`	Route reflector ID in an IPv4 address format

Default

By default, cluster id is set bgp cluster id

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following configuration creates a cluster-id 5 including two route-reflector-clients.

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 2.2.2.2 remote-as 200
(config-router)#neighbor 3.3.3.3 remote-as 200
(config-router)#neighbor 3.3.3.3 route-reflector-client
(config-router)#neighbor 5.5.5.5 remote-as 200
(config-router)#neighbor 5.5.5.5 route-reflector-client
(config-router)#neighbor 6.6.6.6 remote-as 200
(config-router)#bgp cluster-id 5
```

bgp confederation identifier

Use this command to specify a BGP confederation identifier.

Use the `no` parameter with this command to remove a BGP confederation identifier.

Command Syntax `bgp confederation identifier <1-65535> no bgp confederation identifier`

Parameter

`<1-65535>`	Routing domain confederation AS number

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp confederation identifier 1
```

bgp confederation peers

Use this command to configure the Autonomous Systems (AS) that belong to a confederation. A confederation allows an AS to be divided into several ASs. The AS is given a confederation identifier. External BGP (eBGP) routers view only the whole confederation as one AS. Each AS is fully meshed within itself and is visible internally to the confederation.

Use the `no` parameter with this command to remove an autonomous system from the confederation.

Command Syntax `bgp confederation peers`

`<1-65535> no bgp confederation peers`

`<1-65535>`

Parameter

`<1-65535>` AS numbers of eBGP peers that are in the same confederation

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

In the following configuration example, the neighbor 172.210.30.2 and 172.210.20.1 have iBGP connection within AS 100, neighbor 173.213.30.1 is a BGP connection with a confederation peer 200 and neighbor 6.6.6.6 has an eBGP connection to external AS 300.

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp confederation identifier 300
(config-router)#bgp confederation peers 200
(config-router)#neighbor 172.210.30.2 remote-as 100
(config-router)#neighbor 172.210.20.1 remote-as 100
(config-router)#neighbor 173.213.30.1 remote-as 200
(config-router)#neighbor 6.6.6.6 remote-as 300
```

In this configuration, the neighbor 5.5.5.4 has an eBGP connection to confederation 300.

```
#configure terminal
(config)#router bgp 500
(config-router)#neighbor 5.5.5.4 remote-as 300
```

bgp config-type

Use this command to set the BGP configuration to the `standard` type. After setting the configuration to the `standard` type, use the neighbor send-community command to send out BGP community attributes. The `SWMRE` configuration type is the default and requires no specific configuration for sending out BGP standard community and extended community attributes.

For the `standard` type, the `no synchronization` command is always shown in the configuration, whereas for the `SWMRE` type, this command is the default.

Use the `no` parameter with this command to remove this configuration.

Command Syntax bgp config-type (standard|SWMRE) no bgp config-type

Parameters standard Standard style configuration SWMRE SWMRE style configuration

Default

The default configuration type is: bgp config-type SWMRE

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bgp config-type standard
```

bgp dampening

Use this command to enable BGP route dampening and set various parameters. Route dampening minimizes the instability caused by route flapping. A penalty is added for every flap in a flapping route. As soon as the total penalty reaches the suppress limit the advertisement of the route is suppressed. This penalty is decayed according to the configured half time value. Once the penalty is lower than the reuse limit, the route advertisement is unsuppressed. The dampening information is purged from the router once the penalty becomes less than half of the reuse limit.

Use the no parameter with this command to unset BGP dampening parameters.

Command Syntax bgp dampening bgp dampening <1-45> bgp dampening <1-45> <1-20000> <1-20000> <1-255> bgp dampening <1-45> <1-20000> <1-20000> <1-255> <1-45> bgp dampening route-map WORD no bgp dampening no bgp dampening <1-45> no bgp dampening <1-45> <1-20000> <1-20000> <1-255> no bgp dampening <1-45> <1-20000> <1-20000> <1-255> <1-45> no bgp dampening route-map no bgp dampening route-map WORD

Parameters

<1-45>	Reachability half-life time for the penalty in minutes. The time for the penalty to decrease to one-half of its current value.

<1-20000>	Value to start reusing a route. When the penalty for a suppressed route decays below the reuse value, the routes become unsuppressed.
<1-20000>	Value to start suppressing a route. When the penalty for a route exceeds the suppress value, the route is suppressed
<1-255>	Maximum duration to suppress a stable route in minutes.
<1-45>	Un-reachability half-life time for the penalty in minutes.
route-map	Route map to specify criteria for dampening.
WORD	Route-map name.

Defaults

The default reachability half-life is 15 minutes.

The default reuse limit is 750.

The default suppress limit is 2000.

The default max-suppress value is 4 times the half-life time, or 60 minutes.

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 11
                                    (config-router)#bgp dampening 20 800 2500 80 25
```

bgp default ipv4-unicast

Use this command to configure BGP defaults and activate IPv4-unicast for a peer by default. This affects the BGP global configuration.

Use the `no` parameter with this command to disable the default behavior of the BGP routing process of exchanging IPv4 addressing information with BGP neighbor routers.

Command Syntax `bgp default ipv4-unicast no bgp default ipv4-unicast`

Parameters

None

Default

IPv4 unicast is the default BGP behavior.

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp default ipv4-unicast
```

bgp default local-preference

Use this command to change the default local preference value.Local preference indicates the preferred path when there are multiple paths to the same destination. The path having a higher preference is preferred. The preference is sent to all routers and access servers in the local autonomous system.

Use the `no` parameter with this command to revert to the default value for local preference.

Command Syntax `bgp default local-preference <0-4294967295> no bgp default local-preference no bgp default local-preference <0-4294967295>`

Parameter

`<0-4294967295>` Local preference value

Default

By default, local preference value is 100

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp default local-preference 2345555
```

bgp deterministic-med

Use this command to compare the Multi Exit Discriminator (MED) variable when choosing among routes advertised by different peers in the same autonomous system. MED is compared after BGP attributes weight, local preference, ASpath and origin have been compared and are equal.

For a correct comparison result, enable this command on all routers in a local AS. After enabling this command, all paths for the same prefix are grouped together and arranged according to their MED value. Based on this comparison, the best path is then chosen. This command compares MED variable when choosing routes advertised by different peers in the same AS, to compare MED, when choosing routes from neighbors in different ASs use the bgp alwayscompare-med command.

When the bgp deterministic-med command is enabled, routes from the same AS are grouped together, and the best routes of each group are compared. If the BGP table showed:

```
Route1: as-path 200, med 300, internal
Route2: as-path 400, med 200, internal
Route3: as-path 400, med 250, external
```

BGP would have a group of Route1 and a second group of Route2 and Route3 (the same ASs). The best of each group is compared. Route1 is the best of its group because it is the only route from AS 200. Route1 is compared to the Route2, the best of group AS 400 (the lower MED). Since the two routes are not from the same AS, the MED is not considered in the comparison. The external BGP route is preferred over the internal BGP route, making Route3 the best route; the preferred route would be different if `always-compare-med` command is enabled (See `alwayscompare-med` command).

Use the `no` parameter with this command to disallow this setting.

Command Syntax		
`bgp deterministic-med`	`no`	`bgp deterministic-med`

Parameters

None

Default

By default, bgp deterministic med is disabled

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp deterministic-med

(config)#router bgp 100
(config-router)#no bgp deterministic-med
```

bgp enforce-first-as

Use this command to enforce the first AS for eBGP routes. This command specifies that any updates received from an external neighbor that do not have the neighbor's configured Autonomous System (AS) at the beginning of the AS_PATH in the received update must be denied. Enabling this feature adds to the security of the BGP network by not allowing traffic from unauthorized systems.

Using the `no` parameter with this command to disable this feature.

Command Syntax `bgp enforce-first-as no bgp enforce-first-as`

Parameters

None

Default

By default, enforce-first-as is disabled

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp enforce-first-as

(config)#router bgp 100
(config-router)#no bgp enforce-first-as
```

bgp extended-asn-cap

Use this command to configure a BGP router to send 4-octet ASN capabilities. If attempting to change the AS capability from 2 to 4 or 4 to 2, a prompt occurs to remove the VRF configuration (if it exists), and reconfiguration is required, because the route distinguisher (RD) configuration would have been created with the current (2 octet or 4 octet) capability, and must be reconfigured before attempting to change the capability.

While loading from a saved configuration with AS4 capability and BGP VRF configuration, the capability will not be changed because of the above described reason.

Use the `no` parameter with this command to prevent a BGP router from sending 4-octet ASN capabilities.

Command Syntax `bgp extended-asn-cap no bgp extended-asn-cap`

Parameters

None

Default

By default, the bgp extended ASN capability and Four-octet capabilities are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bgp extended-asn-cap
```

bgp fast-external-failover

Use this command to reset a BGP session immediately, if the interface used for BGP connection goes down.

Use the `no` parameter with this command to disable this feature.

Command Syntax `bgp fast-external-failover`

`no bgp fast-external-failover`

Parameters

None

Default

By default, fast-external failover is enabled

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp fast-external-failover
```

bgp graceful-restart

Use this command to enable BGP graceful-restart capabilities. The restart-time parameter is used for setting the maximum time that a graceful-restart neighbor waits to come back up after a restart. This value is applied to all neighbors unless you explicitly override it by configuring the corresponding value on the neighbor. The stalepath-time parameter is used to set the maximum time to preserve stale paths from a gracefully restarted neighbor. All stalepaths, unless reinstated by the neighbor after a re-establishment, will be deleted at the expiration of this timer.

Use the `no` parameter with this command to restore the router to its default state.

Command Syntax `bgp graceful-restart bgp graceful-restart graceful-reset bgp graceful-restart restart-time <1-3600> bgp graceful-restart stalepath-time <1-3600> no bgp graceful-restart no bgp graceful-restart graceful-reset no bgp graceful-restart restart-time no bgp graceful-restart stalepath-time`

Parameters

`graceful-reset` The BGP daemon is not restarted, so that any changes in network configurations that cause BGP reset do not affect packet forwarding.

`restart-time` Maximum time needed for neighbors to restart. Default is 90 seconds.

`<1-3600>` Delay value in seconds. `stalepath-time` Maximum time to retain stale paths from restarting neighbors. Default is 360 seconds.

`<1-3600>` Delay value in seconds.

Default

By default, the maximum time for neighbors to restart is 90 seconds.

By default, the maximum time to retain stale paths from restarting neighbors is 360 seconds.

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
    #configure terminal
    (config)#router bgp 10
    (config-router)#bgp graceful-restart

    #configure terminal
    (config)#router bgp 10
(config-router)#no bgp graceful-restart
```

bgp g-shut

Use this command to gracefully shut down all BGP IPv4 sessions under this router. The BGP graceful shutdown feature reduces packet loss during maintenance activity.

Use the `no` parameter with this command to bring up all the sessions under this router after completion of activity using the `bgp g-shut` maintenance command.

Command Syntax `bgp g-shut no bgp g-shut`

Parameters

None

Default

By default, bgp g-shut is disabled

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp g-shut
```

```
#configure terminal
(config)#router bgp 100
(config-router)#no bgp g-shut
```

bgp g-shut-capable

Use this command to enable the graceful shutdown capability at the router level and make available the gracefulshutdown related commands at the router and BGP neighbor levels.

Use the `no` parameter with this command to disable the graceful shutdown capability on a router.

Note: The graceful shutdown capability cannot be disabled on a router that is in a graceful shutdown state until it comes out this state--after the graceful shutdown has been initiated and the impacted BGP sessions are up again.

Command Syntax `bgp g-shut-capable no bgp g-shut-capable`

Parameters

None

Default

By default, the graceful shutdown capability is disabled at the router level

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp g-shut-capable

#configure terminal
(config)#router bgp 100
(config-router)#no bgp g-shut-capable
```

bgp g-shut-local-preference

Use this command to sets the local preference of the router to use during graceful shutdown. The local preference value indicates the preferred path when there are multiple paths to the same destination in a single routing database. The path with a higher preference value is the preferred one. The preferred path is sent to all routers and access servers in the local autonomous system.

Use the `no` parameter with this command to revert to the default setting.

Command Syntax `bgp g-shut-local-preference <0-4294967295> no bgp g-shut-local-preference`

Parameters

`<0-4294967295>` Local preference value

Default

By default, the local preference value is set to 0

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
```

```
(config)#router bgp 100 (config-router)#bgp g-
shut-local-preference 22
```

bgp log-neighbor-changes

Use this command to enable logging of status change messages without turning on debug bgp commands. SWMRE has many logging services for neighbor status, including `debug bgp fsm` and `debug bgp events`. However, these commands cause system performance degradation. If you need to log neighbor status changes only, Symanitron recommends turning off all debug commands and using the `bgp log-neighbor-changes` command instead. A sample output of the log is:

```
%Protocol-Severity-Events: Message-text
```

A sample output of the log for an `interface down` event is:

```
%BGP-5-ADJCHANGE: neighbor 10.10.0.24 Down Interface flap
```

This command logs the following events:

- BGP Notification Received
- Erroneous BGP Update Received
- User reset request
- Peer time-out
- Peer Closing down the session
- Interface flap
- Router ID changed
- Neighbor deleted
- Member added to peer group
- Administrative shutdown
- Remote AS changed
- RR client configuration modification
- Soft reconfiguration modification

Use the `no` parameter with this command to disable this feature.

Command Syntax `bgp log-neighbor-changes no bgp log-neighbor-changes`

Parameters

None

Default

By default, bgp log neighbor changes is disabled

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
(config)#router bgp 100
                                        (config-router)#bgp log-neighbor-changes
```

© Symanitron Proprietary

bgp multiple-instance

Use this command to enable BGP multiple instance support.

Use the `no` parameter with this command to disable this function.

Note: The `no bgp multiple-instance` command is not valid when any BGP instances are present.

Command Syntax `bgp multiple-instance (allow-same-peer|)` `no bgp multiple-instance (allow-same-peer|)`

Parameters `allow-same-peer`

Allow the same peer in multiple instances

Default

By default, there is no multiple-instance support in BGP

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following example shows the use of the `bgp multiple-instance` command allowing the configuration of two instances.

```
(config)#bgp multiple-instance

(config)#quit #show
running-config

Current configuration:
hostname SWMRE
password zebra
log stdout
! debug bgp debug
bgp events debug
bgp updates
debug bgp fsm
!
bgp multiple-instance
! router bgp
11
```

```
 bgp router-id 10.10.10.50
neighbor 10.10.10.51 remote-as 11
!
```

bgp nexthop-trigger delay

Use this command to set the delay time for nexthop address tracking. This command configures the delay interval between routing table walks for nexthop delay tracking, after which BGP does a routing table scan on receiving a nexthop change trigger from NSM. The time period determines how long BGP waits before it walks the full BGP table to determine which prefixes are affected by the nexthop changes, after it receives the trigger from NSM about one or more nexthop changes.

Use the `no` parameter with this command to reset the timer value to the default value.

Command Syntax `bgp nexthop-trigger delay <1-100> no bgp nexthop-trigger delay`

Parameter

`<1-100>`	Nexthop trigger delay interval in seconds

Default

By default, nexthop-trigger delay time is 5 seconds

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bgp nexthop-trigger delay 6

#configure terminal
(config)#no bgp nexthop-trigger delay
```

bgp nexthop-trigger enable

Use this command to enable nexthop address tracking. Nexthop address tracking is an event-driven notification system that monitors the status of routes installed in the Routing Information Base (RIB) and reports nexthop changes that affect internal BGP (iBGP) or external BGP (eBGP) prefixes directly to the BGP process. This improves the overall BGP convergence time, by allowing BGP to respond rapidly to nexthop changes for routes installed in the RIB.

If nexthop tracking is enabled after certain routes are learned, the registration of all nexthops for selected BGP routes is done after the nexthop tracking feature is enabled. If nexthop tracking is disabled, and if there are still some selected BGP routes, BGP de-registers the nexthops of all selected BGP routes from NSM.

Use the `no` parameter with this command to disable this feature. If the `no` command is given when nexthop tracking is in the process of execution, an error appears and nexthop tracking is not disabled. However, if the nexthop tracking timer is running at the time of negation, the nexthop tracking timer is stopped, and nexthop tracking is disabled.

Command Syntax `bgp nexthop-trigger enable` `no bgp nexthop-trigger enable`

Parameters

None

Default

By default, nexthop address tracking is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bgp nexthop-trigger enable
```

bgp rfc1771-path-select

Use this command to set RFC 1771 compatible path selection.

Use the `no` parameter with this command to revert this setting.

Command Syntax `bgp rfc1771-path-select` `no bgp rfc1771-path-select`

Parameters

None

Default

Standard compatible path selection mechanism.

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bgp rfc1771-path-select
```

bgp rfc1771-strict

Use this command to set the origin path attribute to “IGP” when the origin is a protocol such as RIP, OSPF, or ISIS as specified in RFC 1771. Otherwise, the origin is always set to “incomplete” which is the industry standard.

Use the `no` parameter with this command to revert this setting.

Command Syntax `bgp rfc1771-strict no bgp rfc1771-strict`

Parameters

None

Default

By default, bgp rfc1771 strict is disabled

Command Mode

Configure mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#bgp rfc1771-strict
```

bgp router-id

Use this command to manually configure a fixed router ID as a BGP router identifier. When this command is used to configure a fixed router ID, the current router identifier is overridden and the peers are reset.

Use the `no` parameter with this command to remove a manually configured fixed router ID.

Command Syntax `bgp router-id A.B.C.D no bgp router-id no bgp router-id A.B.C.D`

Parameter

`A.B.C.D`	Router ID in an IPv4 address format

Default

Once the BGP router-id is elected, it may be re-elected in the following cases:

a. When an explicit BGP router-id is configured/un-configured

b. When the router's (global) router-id is set/unset (holds true when (a) is not applicable),

c. When the BGP process is cleared (holds true when both (a) & (b) are not applicable and the IP address(es) on the active interfaces are updated, which may result in a change in the router's router-id).

If no loopback interface is configured, the highest IP address is the BGP router-id.

When a loopback interface is configured, the BGP router-id is set to the IP address of the loopback interface.

Note: Symanitron recommends that you always configure a router identifier to avoid unpredictable behavior if the address of a loopback interface changes.

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp router-id 10.1.2.7

(config)#router bgp 100
(config-router)#no bgp router-id 10.1.2.7
```

bgp scan-time

Use this command to configure scanning intervals of BGP routers. This interval is the period after which router checks the validity of the routes in its database. To disable BGP scanning, set the scan-time interval to 0 seconds.

Use the `no` parameter with this command to disable this function.

Command Syntax `bgp scan-time <0-60> no bgp scan-time no bgp scan-time <0-60>`

Parameter

`<0-60>`	Scanning interval in seconds

Default

By default, scan-time interval is 60 seconds.

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp scan-time 10
```

bgp table-map

Use this command to enable or disable suppression/modification of incoming BGP updates to IP RIB/FIB table installation.

In a dedicated route reflector, all the routes it receives may not be required to be stored or only few selected routes need to be stored, because it may not lie in the data path.

Table maps are particularly useful to attain this restriction. Table-map command can be used in two ways:

- When a simple table-map command is given, the route map referenced in the table-map command shall be used to set certain properties (such as the traffic index) of the routes for installation into the RIB. The route is always downloaded, regardless of whether it is permitted or denied by the route map.
- When the option ‘filter’ is given in the table map command, the route map referenced is used to control whether a BGP route is to be downloaded to the IP RIB (hence the filter). A BGP route is not downloaded to the RIB if it is denied by the route map.

Use this command in Router mode to set the table map rule for all address families. Use this command in Address Family mode to set the table map rule per an IPv4 or IPv6 family.

Use the `no` parameter with this command to remove the table-map rule.

Command Syntax `table-map`

```
WORD (|filter)
```

Parameter

`WORD`	Specify the route-map name to apply.
`filter`	Filer the routes. If present, the incoming routes are pruned as per the rule specified in route-map-name. If not, it is used to alter the incoming packet information.

Default

All BGP routes will be downloaded to IP RIB

Command Mode

Router mode, Address Family IPv4 mode, and Address Family IPv6 mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

The following example shows how to set the table-map command without filter for BGP for all address families.

```
#configure terminal
(config)#router bgp 100
(config-router)#table-map abc
```

The following example shows how to set the table-map command with filter for BGP for all address families.

```
#configure terminal
(config)#router bgp 100
(config-router)#table-map abc filter
```

The following example shows how to set the table-map command without filter for BGP for an IPv6 address family.

```
(config)#router bgp 100
(config-router)#address family ipv6
(config-router-af)# table-map abc
```

The following example shows how to set the table-map command with filter for BGP for an IPv6 address family.

```
(config)#router bgp 100
(config-router)#address family ipv6
(config-router-af)# table-map abc filter
```

bgp update-delay

Use this command to set the update delay for a graceful-restart capable router. The update-delay value is the maximum time a graceful-restart capable router, which is restarting, will defer route-selection and advertisements to all its graceful-restart capable neighbors. This maximum time starts from the instance the first neighbor attains established state after restart. The restarting router prematurely terminates this timer when end-of-RIB markers are received from all its graceful-restart capable neighbors.

Use the `no` form of this command to set to the update delay to its default value.

Command Syntax `bgp update-delay <1-3600> no bgp update-delay no bgp update-delay <1-3600>`

Parameters

`<1-3600>` Delay interval in seconds

Default

By default, update-delay value is 120 seconds

Command Mode

Router mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#bgp update-delay 345
```

clear bgp (A.B.C.D|X:X::X:X)

Use this command to reset a BGP neighbor address.

Command Syntax `clear bgp (A.B.C.D|X:X::X:X) clear bgp (A.B.C.D|X:X::X:X) in clear bgp (A.B.C.D|X:X::X:X) in prefix-filter clear bgp (A.B.C.D|X:X::X:X) out`

Parameters

`A.B.C.D` IPv4 neighbor address. `X:X::X:X` IPv6 neighbor address.

`in` Clear incoming advertised routes.

`prefix-filter` Push out prefix-list ORF and do inbound soft reconfig.

`out` Clear outgoing advertised routes.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear bgp 3.3.3.3
```

clear bgp *

Use this command to reset the BGP connection for all peers.

Command Syntax `clear bgp * clear bgp * in clear bgp * in prefix-filter clear bgp * out clear bgp * soft clear bgp * soft in clear bgp * soft out clear ip bgp * clear ip bgp * in clear ip bgp * in prefix-filter clear ip bgp * out clear ip bgp * soft clear ip bgp * soft in clear ip bgp * soft out clear ip bgp * ipv4 (unicast|multicast) in clear ip bgp * ipv4 (unicast|multicast) in prefix-filter clear ip bgp * ipv4 (unicast|multicast) out clear ip bgp * ipv4 (unicast|multicast) soft clear ip bgp * ipv4 (unicast|multicast) soft in clear ip bgp * ipv4 (unicast|multicast) soft out`

Parameters

`in` Incoming advertised routes should be cleared.

`prefix-filter` Push out prefix-list ORF and do inbound soft reconfig.

`out` Clear outgoing advertised routes.

`soft` Clear both incoming and outgoing routes.

- `in` Soft reconfig inbound update.
- `out` Soft reconfig outbound update.

`ipv4` Clear incoming advertised routes.

- `multicast` Multicast prefixes.
- `unicast` Unicast prefixes.
  - `in` Clear incoming advertised routes.
  - `prefix-filter` Push out prefix-list ORF and do inbound soft reconfig.
  - `out` Clear outgoing advertised routes.
  - `soft` Clear both incoming and outgoing routes.
  - `in` Soft reconfig inbound update.
  - `out` Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear bgp *
#clear ip bgp * ipv4 unicast in prefix-filter
```

clear bgp <1-4294967295>

Use this command to reset a BGP connection for all peers in a specified Autonomous System.

Command Syntax `clear bgp <1-4294967295> clear bgp <1-4294967295> in clear bgp <1-4294967295> in prefix-filter clear bgp <1-4294967295> out clear bgp <1-4294967295> soft clear bgp <1-4294967295> soft in clear bgp <1-4294967295> soft out clear ip bgp <1-4294967295> clear ip bgp <1-4294967295> in clear ip bgp <1-4294967295> in prefix-filter clear ip bgp <1-4294967295> out clear ip bgp <1-4294967295> soft clear ip bgp <1-4294967295> soft in clear ip bgp <1-4294967295> soft out clear ip bgp <1-4294967295> ipv4 (unicast|multicast) in clear ip bgp <1-4294967295> ipv4 (unicast|multicast) in prefix-filter clear ip bgp <1-4294967295> ipv4 (unicast|multicast) out clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft in clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft out`

Parameters

`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.
`ipv4`	Clear incoming advertised routes.
`multicast`	Multicast prefixes.
`unicast`	Unicast prefixes.
	Clear incoming advertised routes.
`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear bgp 4294967277
#clear ip bgp 4294967277
```

clear bgp dampening

Use this command to reset BGP route flap dampening information.

Command Syntax `clear bgp ipv4 (unicast|multicast) dampening clear bgp ipv4 (unicast|multicast) dampening A.B.C.D/M clear ip bgp dampening clear ip bgp dampening A.B.C.D/M clear ip bgp ipv4 (unicast|multicast) dampening clear ip bgp ipv4 (unicast|multicast) dampening A.B.C.D/M`

Parameters

`ipv4`	IPv4 address family.
`multicast`	Multicast prefixes
`unicast`	Unicast prefixes
`A.B.C.D/M`	IP prefix (network/length), for example, 35.0.0.0/8

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear ip bgp dampening 10.10.0.121/24
#clear ip bgp ipv4 unicast dampening
```

clear bgp external

Use this command to reset the BGP connection for all external peers.

Command Syntax `clear bgp external clear bgp external in clear bgp external in prefix-filter clear bgp external out clear bgp external soft clear bgp external soft in clear bgp external soft out clear ip bgp external clear ip bgp external in clear ip bgp external in prefix-filter clear ip bgp external out clear ip bgp external soft clear ip bgp external soft in clear ip bgp external soft out clear ip bgp external ipv4 (unicast|multicast) in clear ip bgp external ipv4 (unicast|multicast) in prefix-filter clear ip bgp external ipv4 (unicast|multicast) out clear ip bgp external ipv4 (unicast|multicast) soft clear ip bgp external ipv4 (unicast|multicast) soft in clear ip bgp external ipv4 (unicast|multicast) soft out`

Parameters

`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.

`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.
`ipv4`	Clear incoming advertised routes.
`multicast`	Multicast prefixes.
`unicast`	Unicast prefixes.
`in`	Clear incoming advertised routes.
`prefix-filter`	

Push out prefix-list ORF and do inbound soft reconfig.

`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Example

```
#clear ip bgp external
```

clear bgp flap-statistics

Use this command to reset BGP flap statistics.

Command Syntax `clear bgp ipv4 (unicast|multicast) flap-statistics`

`clear bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M vrf (all | default | VRFNAME) clear bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M clear ip bgp flap-statistics clear ip bgp flap-statistics A.B.C.D/M clear ip bgp ipv4 (unicast|multicast) flap-statistics clear ip bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M vrf (all | default | VRFNAME) clear ip bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M`

Parameters

`ipv4`	IPv4 address family.
`multicast`	Multicast prefixes.
`unicast`	Unicast prefixes.
`A.B.C.D/M`	IP prefix (network/length), for example, 35.0.0.0/8
`VRFNAME`	VPN routing or forwarding instance name
`all`	All VRF's
`default`	Default VRF

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear ip bgp flap-statistics
#clear ip bgp ipv4 unicast flap-statistics
```

clear bgp peer-group

Use this command to reset the BGP connection for all members of a peer group.

Command Syntax `clear bgp peer-group WORD clear bgp peer-group WORD in clear bgp peer-group WORD in prefix-filter clear bgp peer-group WORD out clear bgp peer-group WORD soft clear bgp peer-group WORD soft in clear bgp peer-group WORD soft out clear ip bgp peer-group WORD clear ip bgp peer-group WORD in clear ip bgp peer-group WORD in prefix-filter clear ip bgp peer-group WORD out clear ip bgp peer-group WORD soft clear ip bgp peer-group WORD soft in clear ip bgp peer-group WORD soft out clear ip bgp peer-group`

```
WORD ipv4 (unicast|multicast) in clear ip bgp peer-group WORD ipv4
(unicast|multicast) in prefix-filter clear ip bgp peer-group WORD ipv4
(unicast|multicast) out clear ip bgp peer-group WORD ipv4 (unicast|multicast) soft
clear ip bgp peer-group WORD ipv4 (unicast|multicast) soft in clear ip bgp peer-
group WORD ipv4 (unicast|multicast) soft out
```

Parameters

WORD	BGP peer-group name.
in	Clear incoming advertised routes.
prefix-filter	Push out prefix-list ORF and do inbound soft reconfig.
out	Clear outgoing advertised routes.
soft	Clear both incoming and outgoing routes.
in	Soft reconfig inbound update.
out	Soft reconfig outbound update.
ipv4	Clear incoming advertised routes.
multicast	Multicast prefixes.
unicast	Unicast prefixes.
	Clear incoming advertised routes.
in	Clear incoming advertised routes.
prefix-filter	Push out prefix-list ORF and do inbound soft reconfig.
out	Clear outgoing advertised routes.
soft	Clear both incoming and outgoing routes.
in	Soft reconfig inbound update.
out	Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear ip bgp peer-group P1
```

clear bgp statistics

Use this command to reset all BGP statistics.

Command Syntax `clear bgp statistics`

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear bgp statistics
```

clear bgp view

Use this command to reset all peers in a BGP view.

Command Syntax `clear bgp view WORD * clear bgp view WORD * soft clear bgp view WORD * soft in clear bgp view WORD * soft out clear ip bgp view WORD * clear ip bgp view WORD * in prefix-filter clear ip bgp view WORD * soft clear ip bgp view WORD * soft in clear ip bgp view WORD * soft out clear ip bgp view WORD * ipv4 (unicast|multicast) in prefix-filter clear ip bgp view WORD * ipv4 (unicast|multicast) soft clear ip bgp view WORD * ipv4 (unicast|multicast) soft in clear ip bgp view WORD * ipv4 (unicast|multicast) soft out`

Parameters

`WORD` BGP peer group name.

`in` Clear incoming advertised routes.

`prefix-filter`

Push out prefix-list ORF and do inbound soft reconfig.

`soft` Clear both incoming and outgoing routes.

`in` Soft reconfig inbound update.

`out` Soft reconfig outbound update. `ipv4` IPv4 address family. `multicast` Multicast prefixes. `unicast` Unicast prefixes.

`in` Clear incoming advertised routes.

`prefix-filter`

Push out prefix-list ORF and do inbound soft reconfig.

`soft` Clear both incoming and outgoing routes.

`in` Soft reconfig inbound update. `out` Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear ip bgp view myview *
```

clear ip bgp A.B.C.D

Use this command to reset an IPv4 BGP neighbor address.

Command Syntax `clear ip bgp A.B.C.D in clear ip bgp A.B.C.D in prefix-filter clear ip bgp A.B.C.D out clear ip bgp A.B.C.D soft clear ip bgp A.B.C.D soft in clear ip bgp A.B.C.D soft out clear ip bgp A.B.C.D ipv4 (unicast|multicast) in clear ip bgp A.B.C.D ipv4 (unicast|multicast) in prefix-filter clear ip bgp A.B.C.D ipv4 (unicast|multicast) out clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft in clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft out`

Parameters `in` Clear incoming advertised routes.

`prefix-filter`

Push out prefix-list ORF and do inbound soft reconfig.

`out` Clear outgoing advertised routes.

`soft` Clear both incoming and outgoing routes.

`in` Soft reconfig inbound update.

`out` Soft reconfig outbound update.

`ipv4` Clear incoming advertised routes.

`multicast` Multicast prefixes. `unicast` Unicast prefixes.

`in` Clear incoming advertised routes.

`prefix-filter`

Push out prefix-list ORF and do inbound soft reconfig.

`out` Clear outgoing advertised routes.

`soft` Clear both incoming and outgoing routes.

`in` Soft reconfig inbound update. `out` Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear ip bgp 35.0.0.1 in
```

clear ip bgp A.B.C.D vrf

Use this command to reset the VPN Routing/Forwarding (VRF) instance for a peer address.

Command Syntax `clear ip bgp A.B.C.D vrf WORD clear ip bgp A.B.C.D vrf WORD in clear ip bgp A.B.C.D vrf WORD out clear ip bgp A.B.C.D vrf WORD soft clear ip bgp A.B.C.D vrf WORD soft in clear ip bgp A.B.C.D vrf WORD soft out`

Parameters

`A.B.C.D`	IPv4 address
`WORD`	VPN routing/forwarding instance name
`in`	Clear incoming advertised routes
`out`	Clear outgoing advertised routes
`soft`	Clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear ip bgp 35.0.0.1 vrf
```

clear ip bgp table-map

Use this command to apply the modified table map or route map rules to the BGP routes in the existing IP routing table.

Command Syntax `clear ip bgp table-map (vrf (VRFNAME|all|default))`

`clear ip bgp ipv4 (unicast | multicast) table-map(vrf (VRFNAME|all|default))`

Parameters

`vrf`	Select a VPN Routing/Forwarding Instance.
`VRFNAME`	Specify a VPN Routing/Forwarding instance name.
`all`	Select all VRFs.
`default`	Select default VRFs.
`unicast`	Unicast prefixes.
`multicast`	Multicast prefixes.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#clear ip bgp table-map vrf all
```

debug bgp

Use this command to enable all BGP troubleshooting functions. Use this command without any parameters to turn on normal bgp debug information.

Use the `no` parameter with this command to disable this function.

Command Syntax `debug bgp (all|) debug bgp bfd debug bgp dampening debug bgp events debug bgp filters debug bgp fsm debug bgp keepalives debug bgp mpls debug bgp nht debug bgp nsm debug bgp updates debug bgp updates (in|out) debug bgp vpls no debug bgp (all|) no debug bgp bfd no debug bgp dampening no debug bgp events no debug bgp filters no debug bgp fsm no debug bgp keepalives no debug bgp mpls no debug bgp nht no debug bgp nsm no debug bgp updates no debug bgp vpls undebug bgp (all|) undebug bgp bfd undebug bgp dampening undebug bgp events undebug bgp filters undebug bgp fsm undebug bgp keepalives`

```
undebug bgp mpls undebug bgp nht undebug bgp nsm undebug bgp
updates undebug bgp vpls
```

Parameters

`all`	Used only with the `no` form; turns off all debugging for BGP
`bfd`	Enable debugging for BGP Bidirectional Forwarding Detection
`dampening`	Enable debugging for BGP dampening
`events`	Enable debugging for BGP events
`filters`	Enable debugging for BGP filters
`fsm`	Enable debugging for BGP Finite State Machine (FSM)
`keepalives`	Enable debugging for BGP keepalives
`mpls`	Enable debugging for BGP Multiprotocol Label Switching (MPLS)
`nht`	Enable debugging for BGP NHT
`nsm`	Enable debugging for NSM messages
`updates`	Enable debugging for BGP updates
`in`	Debug inbound updates
`out`	Debug outbound updates
`vpls`	Enable debugging for BGP Virtual Private LAN Service (VPLS)

Command Mode

Privileged Exec mode and Configure Mode

Applicability

This command was introduced before SWMRE version 1.3.

Examples

```
#debug bgp
#debug bgp events
```

distance bgp

Use this command to define an administrative distance. A distance is a rating of trustworthiness of a router. The higher the distance the lower the trust rating. Administrative distances can be set for external, internal and local routes. External paths are routes learned from a neighbor outside of the AS. Internal routes are routes learned from another router within the same AS. Local routes are for a router that is redistributed from another process.

If the administrative distance is changed, it could create inconsistency in the routing table and obstruct routing. Use this command in Router mode to set the administrative distance for all address families. Use this command in Address Family mode to set the administrative distance per an IPv4 family.

Use the `no` parameter with this command to remove an administrative distance.

Command Syntax `distance bgp <1-255> <1-255> <1-255> no distance bgp`

```
no distance bgp <1-255> <1-255> <1-255>
```

Parameters

<1-255>	Distance for BGP external routes
<1-255>	Distance for BGP internal routes
<1-255>	Distance for BGP local routes

Command Mode

Router mode, Address Family IPv4 mode

Defaults

Default distance for external routes is 20.

Default distance for internal routes is 200.

Default distance for local routes is 200.

Applicability

This command was introduced before SWMRE version 1.3.
